Sir,—The article of Mr. Charles W. Seiden in your issue of the 15th Inst. has been perused by me, and no doubt by very many others interested in the army, with a good deal of satisfaction, as the author seemed to be fairly well posted. The only matter he is mistaken in is when he thinks that the young man who has gone successfully through a technical high school could, on entering the army, at once pursue his profession in the coast artillery, the engineers, or the electrical department or branch of the service. No sir! He must stay first for about two months in a recruit depot and learn how to walk, to salute officers, to hand coal, shoes, and soap to and from officers' and civilians' quarters, to do manual labor for which other establishments and foreign armies have navies. Then must learn that in donning the uniform of the United States army he has ostracized himself (at least in peace time) from the average civilian; that he must look up to the commissioned personnel of his calling as something far above him in social standing, in manners, etc., no matter who wears the shoulder-straps, be he a gentleman or political harridan. While the actual discipline of the United States army is far below the standard of any other army in civilization, the social distinction between the officer and the enlisted man is far greater in this country of much vaunted equality than the same distinction is between a duke and a peasant in England.

While, for instance, the German officer when on duty would not allow his brother, should he be in the ranks, wink an eye, and would demand strict obedience and respectful salute from him as if he were a stranger, yet after drill or the day's duty is done he would go with him to the theatre or some other social function without giving the matter a thought. But in our army the reverse is the ticket. I have served in a post where two brothers were serving, one as an officer, the other in the ranks. Now the one in the ranks was shown all kinds of leniencies and favors in the line of duty and discipline, because his brother was a lieutenant, but if he wanted to have a familiar conversation with his brother, the lieutenant, when he had to wait until dark, and enter his brother's house in the officers' row by the back entrance. Now does Mr. Seiden think any sane man out of high school would stand for that kind of alienation? There are very many of our officers who are gentlemen in the fullest sense of the word by birth and education, and who would not think that their title would be degraded by talking to an educated enlisted man outside the line of duty as man to man; but it is the political harridans who got their commission through the number of votes their relatives could buy or sell, and who have no other claim to the title of gentleman than their commission gives them, who make the lives of well respecting men disgracing in the service, and who try to impose the enlisted man that he is just a little better than their Portuguese or negro servant.

As to the manual labor, why does this rich country of ours not establish a service corps with clerks, mechanics, bakers, teamsters, messengers, to do these and other like duties now performed by the man who enlisted to become a warrior and not a scavenger? Why not give laborers to perform the scavenger work, the same as every other civilized army in the world does? Why is the American soldier subservient to the officer's servant?

Countries much poorer than ours, and with standing armies six

and seven times the size of ours, do have service corps, and find it profitable.

Germany has never had any trouble to fill the ranks of her colonial troops (which are voluntary enlisted men none as ours), with the best men picked from a large number of applicants. The pay of the German colonial private is 80 marks = \$20, and he is not required to do scavenger work for the officers and civilian employees.

What is the matter with the army?

This: give us a service corps, bid laborers to do the scavenger work and assist the officers' servants. Treat us as full-grown men, and not as protégés of the W. C. T. U. (that blows their ignorance); and give the other privates and non-commissioned officers living salaries, and you will always have the ranks of your army filled to the limit of the law with good and reliable men.

TWENTY YEARS AN ENLISTED MAN

P. S.—From Mr. Seiden the public had the viewpoint looked at from the officers' standpoint; the above article shows how the soldier looks at it. For reasons obvious to the army man I cannot sign my name, but should some of the facts stated above be questioned, I will furnish you with date and places of occurrence.

THE ALDRICH BILL

New Mexico, February 10, 1900.

To the Editor of Harper's Weekly:

Sir,—It is curious to watch subterfuges and dodges, almost immoral, surely unworthy, a serious illness will bring a body, corporate or incorporeal, I have seen a man of exceptional judgment and control under normal conditions agonized with pain, sought to attend physicians. "Can't you see I'm dying?" and the drug for which he prayed, though at the time it would have had the sweetness of the honeycomb, in the aftermath of anguish would have called curses, and, worse, as those who, in his weakness, should have been strong.

I have seen an overcharged engine groaning helplessly because of some flaw in its workings, and yet it did not seem to occur to the engineer that a safe way to make it available might be to increase its moving power, extraneously, placing upon it a burden beyond that of its generating force.

Such therapeutics may have a shade of plausibility in the theory of the strong-physis practitioner of bygone days, who imposed upon his patient as powerful a poison that first, in paralysis, there was a sickness as of death, and then, if the constitution was strong enough, a final rally and return to normal, but always under pressure of more serious distress, more fearful remedy.

And now I see a nation sick with illness as complicated in form that, though the best we have of money men have diagnosed and formulated their prescription, the end, not yet, has seemed to justify the cure: we've had a panic, and surely now, though shortly, are doing something in the righting of ourselves; and this perhaps is best, always adding to the method instinct freedom, the wise word of every statesman; but not a fallacy; money is the moving power of the machine of government—the force which is its own as mathematically as the steam is the right product of the coal. If, through clogging of the passages, or undue loading at rare points, from poor manipulation, we find ourselves without the power, there is no remedy secure enough, when the welfare of a nation is involved, but to remove the cause, directed by the best we have of brains in matters fiscal.

But to demand a greater motion than our wealth commands, to mortgage with the highest guarantee we have, something non-existent is running wild; our standing in good government and credit will be injured, and thus the very possibility of a remedy, as easy will bring upon the nation at large an inertia, while now it is seriously at work on the dilemma, and by such a bit of potentialism folly we should find ourselves rid of our initiative and subject to similar conditions constantly recurring.

I am, sir,

K. A. M.

It is not quite clear to us what our correspondent wants.—EDITOR.

WHAT IS WORTH WHILE

CHICAGO, ILL., February 10, 1900.

To the Editor of Harper's Weekly:

Sir,—May I thank you for the expression of your views in Harper's Weekly for February 13, on "What is Worth While?" It is not often in this day or, as you so aptly express it, "on this step" of materialism that one finds thinking people who have the courage to step aside from the highway of popular opinion. All the more, then, it does the heart good to find one like yourself—confiding not only courage of conviction with a high ideal, but purity of expression as well.

Whatever of literature might otherwise be, for us, in the knowledge of our personal insignificance and helplessness may be compensated by the knowledge (or hope) that through our children our influence on the coming generations may be as powerful as our own is the reverse.

I am, sir,

P. B. H.

QUALIFIED ENCOURAGEMENT

Go to Cavalry. The 10th of March (1900) will leave Julius II. still doing, however; possibly through Antony.

H. B. R.

Henry Loomis Nelson

By E. S. MARTIN

HENRY LOOMIS NELSON, editor of *HARPER'S WEEKLY* from 1894 to 1898, and of more recent years one of its most valued and important contributors, passed from earth on Saturday morning, February 23. His death (from angina pectoris) came so unexpectedly and with so swift an approach, that it can almost literally be said that he laid down his pen to die.

A private sorrow deep and widely extending in Mr. Nelson's death, and at the same time a public loss of serious magnitude, he was two months along in his sixty-third year, and for such a man to die at such an age is no light misfortune to his generation. He could learn and had learned and was still learning. He could remember and did remember. He could think and reason straight and clearly. He had integrity, industry, character. He had lived a full life in the midst of important affairs, had known well many men worth knowing, and for at least thirty years had been a student and a teacher of the greater sort of politics, and kept keenly constant use his facilities of observation and comment. To long in the future of his powers a man so equipped with sound and secure knowledge, and so practised in the use of it, is a trial to philosophy as well as to affection.

His life, like most lives of men who earn their bread in a hard-working profession, was more eventful mentally than in stirring episodes. He was born in New York in January, 1835, and went in due time to Williams College, where he graduated in the class of 1857, having among others as classmates Francis Lynde Stetson and Hamilton W. Mahie. He studied law at Columbia, was admitted (1860) to the bar, and practised law for some years, but soon after his marriage (1874) he went with his wife on a legal errand to Kalamazoo, Michigan. There he stayed two years, and incidentally fell into the habit of writing for a local paper. The habit took so strong a hold

on him that on his return to New York he bought a country newspaper at Greenvale, Massachusetts, and went there to edit it. It only lived a year, but when it died (1878) he was offered and accepted an engagement as Washington correspondent of the *Boston Post*. In this employment he continued at Washington for seven years, during some of which he served also as private secretary to John G. Carlisle, at that time Speaker of the House of Representatives. The associations thus formed gave Mr. Nelson a wide and close acquaintance with public men, the more so as he was himself an exceedingly interesting and agreeable companion, very ready in discourse, able to give no good talk as he got from any one, and withal kind, sympathetic, appreciative, and trustworthy, a good and faithful friend, and delightful company.

From Washington he went to Boston (1883) to be the editor of the *Post*, but that paper had fallen at that time into difficult pecuniary straits, and when in the course of a year it was sold to new owners, Mr. Nelson came back to New York to help the late Mr. William Dorsheimer make a self-supporting newspaper of the *Star*. In spite of Mr. Nelson's help, however, that gallant aspiration proved far beyond Mr. Dorsheimer's powers. In due time the *Star* sank below the horizon, and Mr. Nelson hired out an editorial writer to the *Mail and Express*, then owned by Cyrus Field, and about to pass into the memorable possession of Elliott F. Shepard. From there, after a year or two, he moved over to the *World*, in the editorial page of which he expounded sound finance and Democratic policies with excellent ability, until in

1894 he became editor of *HARPER'S WEEKLY*, succeeding to the place left vacant, late in 1892, by Mr. Curtis. For four years he edited the *WEEKLY*, conducting it through the important campaign against free silver in 1896, and through all the lively period of the Spanish war.

In 1892 he accepted an appointment to the newly established professorship of political science at Williams College, which he still held at the time of his death. He took very ardently in his duties as a college professor, developing very great interest both in his work as a teacher and in the problems of college administration, taking in particular a very decided stand against what he considered to be the heterogenous propensity of intercollegiate athletics to shoulder the more scholastic interests into a corner, and become the dominating feature of college life.

The work of his professorship left him leisure for other labors.

For the last year or two he had been again a regular and considerable contributor to the *WEEKLY*, besides continuing his long-standing practice of writing occasional articles for *Harper's Magazine*, the *North American Review*, the *American Monthly*, and other periodicals. A more considerable work that he undertook about three years ago was to write the life of George William Curtis. But for a serious illness which laid him up two years ago the book would have been completed some time since. As it was, the manuscript is so nearly finished that its completion would have been to him only a matter of a few weeks' work and can now be accomplished by some other hand. It will gratify his friends, who are very many, to have this substantial record of the working of his mind, and of an able and diligent pen shared by far the larger part of the products have been launched day by day in the passing current of journalism.

Thirty-five years ago Mr. Nelson wrote a novel called *John Rastoul*, which was published by James R. Osgood & Co. He published in 1884 a little book on *Our Unpaid Tenth Part*, and another in 1896 called *The Money We Need*. Two of these works are inconsiderable, and the novel was an experiment in a field which he did not cultivate further. It is far the best permanent record of his matured literary powers, as well as of his thought in politics, will be the biography of Mr. Curtis which is to come. Himself always a staunch guardian of civil service reform, he was particularly in sympathy with Mr. Curtis's labors and great achievements in promoting that movement.

In politics Mr. Nelson was a Democrat of the Cleveland and Carlisle pattern, but moderate in his partisanship and quite incapable of following his party in its curious misadventure. Mr. Bryan's guidance into the wilderness of unsound finance and socialist hopes. He had accurate knowledge of politics, history, and finance, and was stoutness in his adherence to views based on that knowledge. He could always remember (not a common capacity, nowadays) not only what his opinions were, but why they were his opinions. If the impression is given by this incomplete record that he devoted unusual powers and exceptional industry to a protracted and often disappointing profession, that impression is doubtless justified by the facts. Journalism was more liberal to him than it is towards him. Nevertheless, he filled the work he wrought so hard at; it never failed to interest him, he took his share of the joy of combat, and loved always to lay on for truth as he saw it, and for the causes and principles in which he believed.

The Lengthening "Bread Line"

By VICTOR ROUSSEAU

Copyright, 1918, by Brown Brothers

The slow, shuffling "Bread Line," tattered in Garb and Spirit, which Waits and Waits and Waits

LINE of men are leaning against a wall. One curls his frozen fingers under the fringes of his ragged coat sleeves; one stamps with alternate feet upon the icy pavement; one, stiff with cold, stands like a sentinel against the wall, immobile; one flaps his arms and dares to get warm; another turns from the curious gaze of some pedestrian. It is the bread line. During past years the drunks and has-beens often crawled into some mission shelter for the sake of the rest, the warmth, the cup of coffee which cheered their chilled brains; but these are neither. They are mechanics and casual laborers, clerks, out-of-work from every stratum of life. Seventy per cent. of them, as municipal investigations show, can produce straight references.

It is midnight upon the Bowery. Across the street the lights of the Thalia Theatre are dimmed by the sparkle of the elevated railroad station. Trains are thundering overhead. Pedestrians have grown less frequent, and the street in front of the Bowery Mission is almost deserted.

At half-past twelve the basement door will be opened and hundreds will throng the steps, eager to snatch a cup of coffee

and a five-cent loan from the hands of the attendants. This charity was founded by Dr. Klopsch, of the *Christian Herald*, five years ago, and is continued between Thanksgiving day and Easter Sunday annually, at an immediate cost of about \$250 a week. Until the present year about a thousand rolls and rations of coffee were distributed nightly. Since February 5 the number has been increased to 1500, while the 500 men who find resting room during the night inside the chapel receive each an extra ration in the morning.

"And it is growing worse," said John H. Long, the assistant superintendent. "Still, we catch very nearly all; only a few are turned away each night. We don't

perch to them; we only wish them a good welcome and feed them."

Down in the basement the volunteer workers are standing beside the huge cans of coffee and the barrels piled high with loaves. Mr. Long puts on his coat and pins to the lapel a police shield. He has been authorized to wear this as a deputy policeman, though the famished men who will soon be waiting for a meal are almost all incapable of making any disturbance.

"How do you pick your 500 who are to sleep in the chapel out of three times that number who receive rations?"

"We feed 'em," said Mr. Long, chuckling (and this spirit of mischief seems curiously at variance with the old superintendent's kindness). "We feed 'em. Some nights we make believe we're going to open the chapel doors, and then when they're all gathered outside we let the rear lot in by the basement. No picking favorites, no parsonage business, and keep 'em guessing. Evening, Bill."

Bill, the big policeman at the door, nods contentedly. "How shall we feed 'em to-night, Bill? Shall we let 'em in by the door as usual? All right; in at the basement for food, then turn 'em all into the street again and throw the doors open."

It is half-past the hour. The light over the door goes up.

Copyright, 1918, by Brown Brothers

Soon after Midnight the Bread Line begins to form around the entire Block in which stands the Bowery Mission

Then, from side streets and dark hallways, where they have been lurking under cover of night, figures come running into the bread line. It stretches round the whole block—Hayward, Canal, Chrystie, and Bowery; and the ragged tail of it scatters itself upon the pavement down toward Clatham Square.

Then the basement door is opened and they file in. As each man enters he receives his roll from an attendant, passes on to take a cup of steaming coffee from the table, drains his cup, sets it down, and passes out again, then by one they enter and file past, a seemingly endless line of men. You watch the first; here seems to be a mechanic, out of a job. The second is a young country boy—prob-

ally he has recently left his home up State to try his fortunes in the city. Next comes a bony Irishman; then an Italian; then a Bowery looking, then clerk or musician. Presently this long, serpentine line which rolls and undulates before you ceases to present a clear impression of the types it contains and acquires an individuality of its own. That of an aggregation of humanity rather than isolated men. The tall man, the foreigner, the clerk, the boy; the tightly buttoned coats, the unshaven faces, many of them sunken; the sallow, the sallow, the sallow; the ravenous hunger units to form one composite picture of poverty.

"Hello, Frenchy," says Superintendent Long.

Frenchy looks round and smiles. He is a very tattered and forlorn replica of one of du Maurier's pictures in *Trilby*—of the student reeling upon the doorstep in drunken slumber. He takes his roll and throws away the stub of a cigarette.

Frenchy was an actor until his last engagement terminated in 1893; he is now a loafer by occupation. He has been known along the Bowery for fifteen years, and has partaken of the hospitality of the Mission since it was opened. He never sleeps, but wakes away his time smoking cigarette stumps.

"Oh, I guess he's a good-hearted fellow," said Superintendent Long. "Refuse him a meal? Not if he's hungry. Why should we? The great trouble with the majority is that they're too good-hearted. If a miser loses his job he has something to fall back upon. Oh, there's the Banker."

The Banker is a dismal old fellow, professionally a picker up of paper. He wears a thick nose round him, summer and winter, for reasons which have not been discovered. He is reported to have a bank account.

"But I can't refuse him," says Superintendent Long. "'If I spend that money now, what in the world will I do when I get old?' he says. Have you seen Greeny, Sam?"

Greeny is a paralyzed fellow with a peculiar gait, apparently of an interesting nature. He did not put in an appearance, but soon there entered a tiny man, a tiny poisonous man, whose head reached just to the level of the table. His black mustache curled out beyond his tiny face.

"That's little Sherry," says an attendant with some pride. "Used to be a policeman at the Tom Thumb night city in Dreamland. I've often seen him walking along with his big badge on him—and look what he's come to."

And still the line winds itself along, the drunk, the out of work, the cripple, the tall man, the foreigner, the clerk, Sam-times two men, nose-times two men, jostle one another against the table and turn round snarling, like two dogs fighting for a bone. A light begins

"But him? hit him, Jack!" cries the Superintendent, snapping his hands. "Go for him, Bill!"

A ring is formed and shouts of laughter are heard. The men regard each other sheepishly for a moment and slouch away. And

still the line goes on. Stay! What are the probabilities that two villainous-looking negroes, each with a blind right eye, a broken nose, and a sinister scowl, will both apply for coffee and roll upon the Bowery at 12:45 during the same morning? Or that two bald and long-faced men with slippers and cracked brown derbies will join the throng?

I asked the assistant superintendent

"Especially?" said Mr. Long. "Let 'em repeat. We feed 'em and they feed us now and again. Turn 'em out! Not while the rolls hold out. It stands to reason they must have slipped in not very far from the tail end, don't it?"

The line goes on, slouching past the bread barrel waiting down the crusta greedily. And now the rolls are coming to an end.

"Twice more, Bill!" calls the attendant.

"Twice more," repeats the policeman outside. "One, two, three . . . ten, eleven, twelve." The basement door slams upon a vision of lean faces and of outstretched hands; and a thirteenth man, who has slipped past, grabs a de-air in a broken fragment of bread on the table.

"Now all out," says the assistant superintendent suddenly to those within who are fingering at the threshold of the door which leads up to the chapel, with its coveted five hundred places. "Go in through the front door and take your chances with the rest."

They fight and squeeze each other in the entrance. It is cold in the street, and no mean privilege to see for four hours in a warm room, packed together tightly upon hard chairs, watching the large crucifix that hangs upon the opposite wall.

"Now all that is required of you is that you will behave like gentlemen," says Mr. Long, pronouncing his valedictory from the platform railing. "And remember when you go out in the morning to leave the pillows and sheets behind you on the bed."

He withdraws amid shouts of hoarse laughter, the hearty mirth that comes with a hail-bill stomach to a starving man. The lights go out, except a little cluster over the center of the hall. They stretch themselves upon the chairs, yawning, snoring, and billing over one another, until the rapping of the attendant's stick wakes them at five o'clock. They stir, put on their broken shoes, slouch down to get their coffee and rolls, and vanish through the side streets of the Bowery, to slink back under the cover of night again.

But the Bowery Mission is only one of those institutions which feed the bread line. At North Street and Broadway the Fleischmann Bakery has dealt out rolls and coffee to the hungry at mid night for the past thirty-two years. Every night several hundreds are fed there. Then, if you are very hungry, and the Bowery and well

will still have time left you to hurry to the tail end of the bread line outside the Mission. Then, again, every day at noon bread is distributed to needy applicants from Miss Holmes's institution at the back of the Army, in Fifteenth Street, where she conducts a self-supporting home for old women.

The Five Hundred who are fortunate enough to gain Entrance to the Chapel of the Bowery Mission sleep on Chairs until Morning

Copyright, 1908, by Brown Brothers

For Thirty-two Years at this Corner, Broadway and Ninth Street, Coffee and Rolls have been given to the Poor at Midnight

And though it is universally conceded that the number of the unemployed shows no decrease, that any amelioration must first filter down from the top to the half-submerged stratum, certainly nobody need starve in New York City to-day.

Women need never starve, for, according to the Salvation Army officials, even now the demand for scrubwomen and domestic helpers is greatly in excess of the supply. It is the man who has to make shift from charity to charity for food, lodging, and clothes. And here is a peculiar characteristic of the respectable unemployed. He prefers to partake anonymously and under cover of night of the wretched bounty of private and semi-public chrematophorous institutions rather than go to the municipal authorities for aid.

Let us contrast the recently opened shelter of the Salvation Army on West Nineteenth Street with the Municipal Lodging House.

Until the new structure shall have been completed on Twenty-fifth Street the municipality continues to house all applicants in the old building two blocks away. From these doors no man or woman possessing less than twenty-five cents has ever been turned. At six o'clock the doors are opened. Applicants are vaccinated, receive free medical attendance, are fed with an unlimited supply of bread and coffee, and cleanly lodged between frosty-panched sheets in an airy room kept pure by exhaust fans. In the morning they can have baths. While the law proscribes three times a month as the limit to which a man or woman is entitled to admission, in practice Superintendent Yorke is permitted to keep those who are deserving for an unlimited period. Every occupant must register, and the records are investigated; but it is only the habits of the city's caravanserai, the drunk-

The Line which forms each Day at Noon to receive free Bread from the Osborne Home for Old Women in West Fifteenth Street

trifle is too small for consideration. The wagons go into every street to collect things which seem to have passed beyond the ingenuity of man to make use of. Waste paper is collected, sorted, tested with acid to discover wood stock, and put up into great bales which bring from three to four dollars each at the paper mills. Tins, leather, rags, bottles, artificial limbs, toys, old shoes—all contribute to the funds of the institution. There is a repairing department for old broken furniture. Old clothes, many of the fashions of the sixties, are sold by auction twice a day to the crowds of the very poor who attend for that purpose. "It cuts us both ways," say the Salvation Army authorities. "The distress is greater than ever before, while those who used to contribute to our funds are now unable to do so."

In spite of the reluctance of homeless men to seek municipal relief, some idea of the poverty now prevalent can be obtained by consulting the records of the Department of Charities. The number admitted to the Municipal Lodging House during the month of January was 11,864, as against 2007 for the January preceding. Of these nine-tenths were men, and the remainder women. Very few children sought the city's shelter, for children over three years of age are turned over to the City Society.

During the last quarter of 1907, 3126 applicants sought for hospital relief, as against 2850 a twelve-month previously; 1068 were sent to the Home for the Aged and Infirm, as against 835. Tickets for meals to those awaiting the authorities' disposal of their cases increased from 710 to 1720; 186 received free transportation to their homes—an increase of 56.

Contrary to the statements of all unofficial charitable societies, the municipal authorities announce a slight decrease in the number of applicants for relief. They believe that the present era of poverty reached its high-water mark during the middle of January and is now slowly subsiding.

Of all charitable benefactions recently inaugurated the best is (Continued on page 32.)

Feeding the Poor in the new Salvation Army Shelter in West Nineteenth Street, from which no one is ever turned away

ards and those with bad characters, who are sent to the police courts as vagrants. The self-respecting man or woman has nothing to fear.

At the foot of West Nineteenth Street, amid the slime and garbage of the riverside, two miserable shanties have been knocked into one by the Salvation Army to house the unfortunate. Everything that is possible has been done; nevertheless, the shelter, which has only been in operation during the present year, has the atmosphere of a hog trough. The air is foul with the exhalations of the unfortunates who crowd it in preference to seeking the charity of the municipality. Here they snore paper and saw wood; and those who are in excess of the number of cots lie about on planks and benches. Poverty, say the attendants here, is 500 per cent. more prevalent this year than they have ever known before. The Army is working heroically to provide more decent quarters; but even at its worst this shelter is preferred to the cold, inquisitorial refuge of the municipality.

The Salvationists have another home on West Forty-eighth Street, where about one hundred men can find employment, their numbers being constantly recruited from the new shelter on Nineteenth Street. This home has a small payroll to its employees of \$250 weekly. It is one of the most remarkable institutions of its kind, for by waste labor and out of waste material it balances its account of \$40,000 a year, and has a trifling amount to its credit.

Where does all the rubbish go? Here, one might answer. No

The Line of hungry School Children to whom free Luncheon is served daily by Adolph Lorber in his Grand Street Restaurant

THE LOAFERS

By CAROLINE DUER

THE gilded world on wheels goes rolling by;
We sit here on a bench and hug our bones.

Hard is the structure of our casual thrones,
Our kingdom of the pavements and the stones.

Yet we behold the show unenvyingly
Through languid, critical eyes. There goes a pair

Of horses we could fancy, and a dame
With scarlet feathers flaunting like a flame

Above a twisted mass of coal-black hair,
Whom we might follow (were we not so lame)

To honor with a second tolerant stare;
But then, so many pass! We watch them go,—

Toys wound for our amusement, every one.
The whole procession pleases, moving on;

Smug coachmen, prancing horses, girls aglow—
We are content the thing should be well done,

(And some of us are competent to know)
We, the Olympians, idling in the sun.

But give us night, and bitter winds to face,
That whistle through our tattered panoply;

And set us, numb, with stiffened necks awry,
Shivering and shuffling as we keep the pace,

Hunched in the bread line that we may not die—
God! How we'd like to see them in our place!

The Irish Party and America

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

UNDERSTAND that Mr. John Redmond, the leader of the Irish Nationalists, is shortly to visit you, collecting his fund. He is after your money, or such of it as your recent troubles have left to you. It is a laudable quest, I will not say it is a degrading one, but I do not think it is one that Mr. Redmond can find the smallest pride or pleasure in. Of all the unmythical depreciable necessities which his position entails, this of begging must be by far the most depreciable. Look at it whichever way you please, it is a reflection on the skillfulness of the Irish Nationalists, and on their capacity for self-sacrifice that they should show this constant and pronounced reluctance to support their cause out of their own pockets. It is not as though they had not the money. There are at this moment some three hundred million dollars on deposit in the joint-stock banks, the post office, and the savings-banks of Ireland. The number of professed Nationalists in Ireland can scarcely be less than three million. I am willing for the purposes of this argument to write two-thirds of them off the list as non-effectives. That would leave a million effective members, of each of them were to subscribe to the party funds a sum of twenty-five cents a year, an annual income of \$250,000 would be the result; and this amount would be amply sufficient to provide for the support of the eighty-eight Nationalist M.P.'s and leave a handsome margin for the purposes of propaganda. I repeat that the Irish people have the money. They spend some sixty or seventy million dollars every year for drink, and there always appears to be plenty of loose cash when it comes to a question of horse-racing or of building a new church. Yet they are so miserably in the support of the cause of nationalism that its leaders have to tramp the world begging for the means to carry on their work.

This is a curious and significant phenomenon. It raises in an acute form the doubt that always assails the dispassionate inquirer into Irish affairs, the doubt as to how far the Irish people really care for home rule. I believe it was Lord Dufferin who remarked that the Irish did not know what they wanted and would never be happy until they got it. There are many cases in which the paradox still holds good. The Irish suffer from a clumsy, extravagant, and above all unmythical government; and that is a positive grievance. But I have never been able to detect among them any of the fierce spirit of an oppressed people struggling to be free. They show none of the determination of the Poles or the Finns. They protest against the eternal enemies of the British Empire, yet they fight its battles and extend its dominions. They pose before the world as a nation held down by force, but at the same time it is they themselves who supply the bulk of the recruits for the army of subjugation. They insist that they have a distinct nationality of their own, yet they have voluntarily allowed themselves to become almost wholly Anglicized in speech, dress, manners, recreations. With an endless flow of rhetoric they reiterate that nothing but home rule will satisfy them, yet they hand over to Americans and Australians the known duty of financing the agitation that presumably lies so near their hearts. What is the cause of all these contradictions? Is it that home rule appeals to the Irish merely as a sentimental sentiment, and that their patient willingness to sacrifice anything for it gives the measure of its essential hollowness? I confess I do not know. Perhaps Mr. Redmond when he reaches America will solve the conundrum. For myself I merely observe the historical fact that the demand for home rule only became really formidable when it was linked on to the agrarian agitation. The land hunger of the peasantry has unquestionably supplied the motive power of the movement for political autonomy. That land hunger is now at last by way of being appeased. Will home rule, deprived of what for thirty years and more has been its life-blood, be able to stand alone? Has it sufficient innate vitality to hold its own when divorced from the question of the land? Of the many fascinating problems which Ireland presents that, perhaps, is the most fascinating.

The Irish Party, I fear, are in a bad way. I say "I fear," because though I dislike many of their methods, their ultimate aim, so far as it looks, is a noble one. They are bent on the spirit of English rule in Ireland and directly associate the Irish people with the management of their own affairs, has my warmest sympathy. But it is impossible to ignore the fact that Irish nationalism is passing through a troublous period. The practical cessation of the land war raises, as I have said, the momentous question whether the agrarian movement, having got all its own out of political agitation, will any longer take the trouble to support the

home rule cause. Moreover all sorts of movements are springing up in Ireland, and proceeding upon the formula that politics after all is a mere by-product, and that the salvation of Ireland is not to be wrought by speeches in the House of Commons, but by the practical work of business in Ireland. The sun-brothers even go so far as to advocate the complete withdrawal of the Irish M.P.'s from Ireland until the constitutional issue has been definitely decided. They have postponed the work of practical emancipation till home rule has been granted, and when others, who either do not favor home rule or are tired of waiting for it, have initiated movements of immediate and constructive benevolence, movements eagerly and obediently followed by the people, the Irish politicians have done all they could to cripple them. They have thus separated themselves from the best Irish thought, and have raised the deplorable presumption that the Irish demand for home rule is in inverse proportion to Irish prosperity.

That is one of the reasons why Ireland is palpably tiring of the Irish Nationalists. Ireland wants to work, and the Irish Nationalists insist on playing politics. Then, again, the more vigorous and stalwart home-rulers intensely resent the degree to which the Irish party has fallen under the domination of the priesthood, of the liquor interests, and of the gentry class. The saloon-keeper, the money-lender, and the hierarchy pull the strings to which Mr. Redmond and his followers are so helplessly attached. The party is full of men who in their heart of hearts do not care twopence about home rule, but who are virtuous in their opposition to any movement that touches on the clerical control of education or on the interests of the publican or on the tyranny which the gentry class exercises over almost the whole of rural Ireland. In many ways I greatly admire and sympathize with the Irish party. They are brilliant parliamentarians. Both as orators and as tacticians they are superior, far superior, to any other group in the House of Commons. Although the majority of them are poor men, who could not live in London unless their expenses were paid for them, as a body of orators and tacticians with the Irish party, they are honestly aloof from the wild scramble for government patronage. Although often torn by personal feuds they manage on the whole, against unnumbered odds, to preserve a unity that is little less than marvellous. Their life can hardly be an enjoyable one. Parliament is sick of Ireland, and the great debates that used to well when reported verbatim in the Irish papers take place in an empty, yawning chamber. Of all political existences I have often thought that of the Irish party in London the most discouraging and pitiable, just as the post of Irish leader has always seemed to me the most anxious and difficult in the whole circumference of British politics. For all these reasons and many others I feel, as I have said, admiration and sympathy for the Irish party. But I cannot see that at present I care more for them than for the Irish people.

The future of Ireland rests with the new order of peasant proprietors that the land purchase acts have called into existence. On their success in increasing the output of the land and in getting the full market for their produce everything, simply everything, depends. The great majority of them are in debt to the gentry class and face the responsibilities of citizenship with a minimum of capital, skill, business training or technical knowledge. They can only be saved from bankruptcy, they can only win to a position of economic independence, by a vast and detailed expansion of the principles of agricultural cooperation. That is how Denmark has made herself one of the most prosperous and contented countries in the world. If Ireland is ever to be a prosperous and contented land most follow in Denmark's footsteps. A splendid beginning has been made. Over 50,000 Irish farmers have been enrolled in some size hundred cooperative societies with an annual turn over of \$10,000,000 a year. But that is a beginning only. More, infinitely more, will have to be done to aid the peasant proprietors on their feet. Sir Horace Plunkett and the Irish Agricultural Organization Society of Lincoln Place, Dublin, stand ready to do it. The Irish party is violently hostile not only to Sir Horace Plunkett, the best and most helpful friend that Ireland has ever had, but to the whole idea of organizing the farmers to insure their welfare. If Americans have any money at all to spare for Irish purposes it is to the Irish Agricultural Organization Society, to send it. Mr. Redmond, that I should respectfully advise them to send it.

The Flight of Man

By ROWLAND STRONG

PARIS CORRESPONDENT FOR "HARPER'S WEEKLY"

PARIS In a thousand years man may be able to accomplish in the matter of flying one-thousandth part of what a sparrow does every minute of its existence." This was the pessimistic opinion expressed to me recently by a French Professor of Natural History after witnessing an afternoon's trials of the Voisin aeroplane at Issy-Moulineaux. The professor knew everything about birds, but this was the first time that he had seen an aeroplane. The mere fact of seeing a man perched on the back of what looked like an enormous kite rise a yard high in the air, and maintain himself in this position, while speeding along at twenty miles an hour, for a quarter of an hour, was wonderful enough, and filled one with hope that at last the secret of aviation was within measurable distance of being discovered, but the professor shook his head, and related such wonderful facts about bird flight, illustrating his remarks from the actual movements of the sparrows flitting about the neighboring house-tops, showing how they could fly on their backs, and practically in every possible position, that they could cope with the strongest winds, that their flying apparatus was limitless in its resources and a perfect instrument, that one again felt despondent.

The recent winning of the Archdeacon prize of \$10,000 by Mr. Henry Farman, who performed a circular flight of one kilometer, has led many to believe that all the problems of aerial flight have been solved.

But as reports upon recent aeroplane feats in Paris have been in many instances highly exaggerated, and not a little misleading, it would be well, perhaps, to put the date upon the "Ia" and describe with impartial accuracy what so far has been actually accomplished. The pioneer of aeroplaning in France is M. Blériot, who, seven years ago, made his debut with an aeroplane with flapping wings, closely resembling the shape of a bird. He was unable to achieve any appreciable results with it, and he abandoned his experiments, until 1903, when he made the acquaintance of Mr. Archdeacon, who is the President of the Aero Club. At Mr. Archdeacon's suggestion he resumed his trials, but this time upon water. The apparatus rose in the air, but promptly turned over, and M. Blériot took a bath for his pains. He then associated himself with a young and energetic engineer, M. Voisin, and began the construction of a new model, with which he experimented once more from the surface of the water, on the lake at Enghien, a suburb to the north of Paris, but still without result. Last year M. Blériot removed to the military parade-ground at Issy-Moulineaux, and with a twenty-four horse-power motor he

managed to fly 100 yards, but the motor proved too weak for further distances. He replaced it by a sixty horse-power motor, and at once rose 25 yards in the air, and flew 184 yards, came to the ground with an unintentional plunge, but won the first prize that had so far been awarded for aviation to an aeroplane—the Aero Club's medal. Encouraged by this success, the indefatigable and ingenious M. Blériot began the construction of an entirely new aeroplane with a fifty horse-power motor, with two wings instead of four, and with a tail movable in all directions. With this machine he has so far made three flights. On the two first occasions he had accidents with the

Henry Farman, who flew a Kfmo-motor in an Aeroplane heavier than Air, and gained the Archdeacon Prize of \$10,000 France

An Antoinette Motor in Place in Santos-Dumont's latest Aeroplane

The Blériot and Voisin Aeroplane, two of which met Disaster

The Delagrè-Archdeacon Aeroplane on Lake d'Enghien

The latest Blériot machine has the elegant form of a dragon-fly, while the newest model of M. Voisin, with which his partner, Mr. Farman, gained the Archdeacon prize, does not resemble anything in the animal creation; but might be compared to a small racing automobile to which a system of parallel cubical flappers had been attached of the shape of Japanese kites. It has a fifty horse-power motor of the Antoinette model invented by Levassour. It has a central screw with long narrow blades, and, in fact, resembles on a gigantic scale those flying toys which were the delight of the last generation, and which were operated by a screw placed at their apex, and wound off upon a string. In the centre is placed a vertical rudder, which is movable only to the right and left. There is also a second rudder placed fore and horizontally to regulate the ascent and descent. It weighs 300 kilos, a little over 1000 pounds.

The Santos-Dumont aeroplane has been very little seen, and only a few trials have been made with it as yet. It

Sixty Feet below the Surface of the Hudson

The Entrance to the double Tube, looking toward New York

One of the new Type of under-river Cars

The Crowd which besieged the New York Tunnel Entrance

THE CONQUEST OF THE HUDSON

THE FIRST OF A SYSTEM OF TUNNELS UNDER THE HUDSON RIVER WHICH WILL CONNECT NEW YORK AND NEW JERSEY WAS OPENED TO THE PUBLIC ON FEBRUARY 25, AND A REGULAR TRAIN SERVICE WAS INAUGURATED THROUGH THE DOUBLE TUBE BETWEEN MANHATTAN AND HOBOKEN. THE MANHATTAN ENTRANCE IS AT SIXTH AVENUE AND NINETEENTH STREET, THE HOBOKEN ENTRANCE AT HUDSON PLACE AND SIXTH STREET. THE SHORT-CAR TRAINS RUN AT THREE AND FIVE MINUTE INTERVALS, AND THE TRIP CONSUMES TWELVE MINUTES. THE DISTANCE FROM TERMINAL TO TERMINAL IS 2.85 MILES. THE WORK WAS BEGUN UNDER THE PRESENT ADMINISTRATION IN 1901, AND IS SAID TO HAVE COST \$50,000,000.

The Army, and What It Offers

By LIEUTENANT FRANKLIN R. KENNEY, RECRUITING OFFICER, U. S. A.

Is the soldier just a thing of the past? Is the baby drum no more to awake in infant America the desire to do and die for the colors? Is the song of the sword that inspired an Alexander, a Hannibal, a Caesar, no longer to shape the fancies of the mothers of men? Hardly! Start a war rumor with even the slightest basis of fact, then watch the recruiting offices.

As an example—which, although it is not along the line of war, still furnishes a parallel—the cruise of "Fighting Bob" Evans and the fleet around the Horn filled the army and marine corps, a thing that had been impossible since the Spanish-American war. Unluckily the army cannot cruise around the Horn, but for almost any boy that desires to see the world and to educate himself by the broadening influence of travel there is offered the chance for duty in all the United States, in sunny Cuba, in Alaska, in romantic Honolulu, then on to the Philippines, and then the stop that all transports make in Japan, and, if you're lucky enough (and to date some 20,000 American soldiers have been that lucky), back through the North Canal and the Mediterranean, belting the globe as they were used to trace on the map of the old school geography in the days when Sir Francis Drake was a hero, and Napoleon an inspiration. And all this not on a personally conducted tour of the most popular lady teachers of Lebanon, Pennsylvania, but as the guest of the U. S. A., with rations, clothes, medicine, and medical attendance free, with ample time to study and to observe and acquire knowledge, and (sailing or sleeping, sick or well) pay coming in every month just the same. True, it is not so very much; but if you do not care to spend it, you may leave it with the army paymaster, where safe and safe in the strongest bank of the world it starts to earn you four per cent, payable with the principal at the completion of the enlistment. As I like to come to my mind the name of a soldier, a non-commissioned officer of the army, who in the last seven years has been to Cuba, Porto Rico, and all over the United States, Honolulu, the Philippines, Japan and China, and who has about \$3000 to his credit in savings. The name and address of this soldier will be gladly furnished upon application. And the soldier need not necessarily take this trip as a stranger among strangers, but he can go with his colon or colonel, or any army recruiting officer, can, by a little extra trouble, procure the assignment of desirable men, who do not wish to be separated, to the same command, and can have them designated, if requested, for foreign service.

If the young American is absolutely inclined, and prefers a thorough training in mechanics or electricity, he may enlist for the coast artillery, make application, and, if capable, go to the artillery school at Fortress Monroe, Virginia, to be turned out a finished and practical man in a profitable modern profession of the greatest commercial value, in which the demand for skilled men is constantly increasing.

The subjects taken up in their order according to the curriculum of the army training school are:

(a) Elementary mathematics; (b) Boilers; (c) Engines (steam, oil, and gasoline); (d) Machine-shop work; (e) Electricity and magnetism.

After completing the course, and qualifying according to the methods of procedure required by the rules and regulations, the soldier may become a master electrician at \$75 per month, an engineer at \$62 per month, or an electrician sergeant at \$45 per month. And the \$75, \$62, and \$45 do not indicate, in effect, the equivalent of the same amounts paid for labor in civil life, for this money is practically clear profit, and any persevering, economically

inclined man can save nine-tenths of his pay, because there goes with it a comfortable little house of four rooms and a bath, including a well-equipped kitchen with cooking utensils all supplied.

With rations free, and properly measured by a flintless housewife, that is ample for two; and Uncle Sam does not object in the least to the tried soldier of this class, who has proved his industry and sobriety, taking a wife. The fuel and lights are also free, as are the clothing and medical attendance.

The Signal Corps of the United States army offers training to the enlisted man along the same lines, with the addition of Aeronautics, or the science of ballooning and airships. This includes the making of trips through the air in balloons handled by soldiers, and the teaching of wireless telegraphy and wireless telephony. According to the pamphlet issued by the War Department, these are some of the subjects in which instruction is first given: telegraphy, practice in sending and receiving; field exercises; night signaling; shopwork; telegraph and telephone instruments; deep sea cables. Members of the next, of advanced class, are given instruction in theoretical electricity, and a special course includes instruction in laboratory work, signal engineering, motors, engine, electric lighting, dynamo, electrical testing, power transmission, transformers, teleboards, hydrogen gas generation, fire control installation, photography and topography.

At the completion of this course the soldier, if qualified, may become a master signal electrician at \$75 per month, with the same allowances as a master electrician of coast artillery.

The pay in these grades and in all grades of the army is increased twenty per cent, for service beyond the limits of the United States.

Should the least educated but applicable recruit, with no knowledge of electricity whatsoever, desire to become an electrician, he has ample time and material at hand at any artillery post to enable him to educate himself in the profession. And when one stops to think of the great advantage in being paid while one is being educated. There is comfort in the fact that, instead of the first of each month bringing the landlord, the baker, the butcher, and the grocer (to say nothing of the plumber) with their bills, it brings instead the paymaster with his always ready check and its never erring certainty. And above all, with this surety come the certainty of the mental and physical betterment both of the ambitious recruit and of the sluggish compelled by intelligent discipline to better himself.

The moral betterment of the man lies with himself alone. If he is a weakling the odds are that he will wind up in the "Mill," officially known as the guard house; but if he possesses even average strength of character the constant contact with older soldiers (and there are lots of them in the army to-day that have gone several years without missing a roll-call) will make him steady and reliable; and should he come out of his enlistment with nothing but a reputation for good character, the mere fact that the bugle had kept him at the job for three years without a breach should add greatly to his value in the eyes of almost any civilian employer to whom he might apply.

Much might be said for the excellent libraries with which each organization is supplied for the use of its enlisted personnel, of the gymnasium, boxing alleys, and billiard and pool tables, of the baseball, football, and basketball and track teams of each army post. Even the much belabored sentence persists in a new tie of white ribbon and rechristened the "Post Exchange," and over its counters is displayed solidly elaborating but very filling "near beer."

The army in time of peace adds to the bulwark of the nation a collected mass of trained soldiers who are living constantly discharged to take up various vocations in civil life.

IN THE MARKET-PLACE

By M. E. WALLER

"WHOLL buy? Wholl buy?"
Is the careless cry

That we hear in the market-place.

Panders of souls and traders in gloves,

Merchants of titles and sellers of doves

Hawk loud their wares.

To him who fares,—

"Wholl buy? Wholl buy?"—

Through the market-place.

The Droll himself smiles freely with all,

With as hearty good-will as before the fall;

He cries to the sinner: "Repent, repent!"

He smiles on the saint: "Tis good fasting in Lent,

But we're all in the market-place;

This barter and bargain rejoice my soul:

Here—I'll take gold."

And the clink of gold is heard in the market-place.

At first a tinkle, and then a clink,

A swift crosswords to rattle and roar

Off a golden estimate over the brick,

The steady, dextrous, golden pair.

To a golden streamlet, in which to sink

The setting sun;

And the day is done, . . .

Buyer and seller each goes his way,

To gather strength for another day;

And over the waste and deserted space

Lie the refuse and slime of the market-place.

A passerby, if he care to look,

May find some things—that are not in a book—

In the slime and waste of the market-place:

Dead aspirations for higher things,

A man's heart with pulsed wings,

And noble thoughts foul-mired by trade.

A woman's heart, in the balance weighed

With a sum of gold—then cast aside.

For another, heavier-portioned bride;

And tears of widows, and orphans' cries,

Strong men's curses, honor, and lies;

A dead-born babe in a refuse-heap,

And things to make the live flesh creep. . .

O search for the name of the man

Of a nation's shame

If it selleth its soul in the market-place!

And I, too, stand in the market-place.

I play for others to sing and dance,

With buyers and sellers I take my chance,

And show my heart.

To the careless mart

For the sake and gain of a little profit—

That body and soul together may hold:

As I stand in the market-place.

ER OF POLITICS

THE SPONSORS OF OUR WARSHIPS

A SHORE OF YOUNG WOMEN WHO HAVE DISTINGUISHED THEMSELVES BY BREAKING WINE BOTTLES OVER THE PROWS OF AMERICAN WARSHIPS IN THE ACT OF CHRISTENING THEM HAVE ORGANIZED THEMSELVES INTO A "SOCIETY OF NAVAL SPONSORS," AND THEY RECENTLY MET FOR THEIR FIRST CONVENTION IN WASHINGTON. THE NAMES OF THE MEMBERS, AND OF THE SHIPS THEY HAVE CHRISTENED, ARE, FROM LEFT TO RIGHT, AS FOLLOWS: (FIRST ROW)—MISS MAY BIERLEY, BROOKLYN, NEW YORK, SPONSOR "BROOKLYN"; MISS BARRETT BARKER, HARTFORD, CONNECTICUT, "WILKES"; MISS ELANOR GOW, QUINCY, MISSISSIPPI, "CUTTLEFISH"; MISS LORNA PINNOCH, BALEM, MASSACHUSETTS, "SALOME"; MISS MARY CAMPBELL, BIRMINGHAM, ALABAMA, "ALABAMA"; MISS KEITH FRAZIER, CHATTANOOGA, TENNESSEE, "TENNESSEE"; MISS MINNIE COVAD, MONTANA, "MONTANA"; MRS. O. W. STEEDMAN, IOWA, "IOWA"; MRS. JOHN G. BOWEN, KENTUCKY, "KENTUCKY." (SECOND ROW)—MISS HELEN BASHLEY, OHIO, "OHIO"; MISS DOROTHY APOSTOL, CHESTER, PENNSYLVANIA, "CHESTER"; MRS. JOHN PEAR, DENVER, COLORADO, "DENVER"; MRS. J. EARL MORGAN, WISCONSIN, "WISCONSIN"; MISS HELEN BERRY, SOUTH CAROLINA, "CHARLESTON"; MRS. WILHELMINA LAMBERT BIRD, "BARBACUE." IN THE THIRD ROW ARE ADMIRALS BULLY AND SHORRER.

Bearding the Governor

A SIDELIGHT ON AN EPOCH-MAKING EVENT

By THEODORA BEAN

I took only one hour to put a hitherto univided chapter into the life of Governor Hughes.

The time was February 19, 1908, 3 P.M. to 4 P.M.; the place, the Executive Chambers in Albany, and the dramatic causes were the Women Suffragists of New York, and their established enemies in the New York State Association Opposed to the Extension of Suffrage to Women.

3 P.M.—Women enter; suffragists to the right, "antis" to the left.

3.02—Governor Hughes whispers to his gold-embroidered secretary.

3.03—His Excellency turns—a speaking chair breaks the gray silence.

3.04—Electric lights blaze a welcome.

3.05—Governor Hughes, still seated, formally declares himself ready for the hearing.

3.12—Revered clash in courtesy of Opponents.

3.20—Picked up feminine pencil dropped by ardent anti.

3.25 to 3.45—Addressed six times as "Sir," five times as "Senator," three as "Mister," twelve as "Excellency," and once as "Oh, Mr. Hughes!"

3.55—Another speaking of the chair.

3.56—A flash of a white handkerchief from an inner pocket.

3.58—Declares "what the women want, women in control of time will have."

4.00—Shakes hands with all, and departs, while both sides claim sympathetic and ultimate victory.

And all the time there was a blizzard out of doors, but the furs, go-bobs, and umbrellas in the Executive Chambers gave vital testimony that truth and special trains prevail against the adversity of the elements. Had they not arrived as planned? Did they lose heart because they had been stalled thirty minutes at Yonkers? They did not. Their fellow-travelers had been the pros

and sons of the Race Track Mill, who had equally been full of definite purpose and torturing hope.

Thus the day had started with practical emotions, and there was no sign of a let-up in any kind of a storm.

They watched in with firm, unflinching step, and smiled an anxious greeting Governor Hughes-way.

His hour had come. At 7.30 His Excellency had asked for his working list, at the same time noticing the increasing sternness without. "Possibly," he ventured, but there was no second word to that sentence. He recalled the persevering character of the women he was about to see, yet when the time came he did not seem a bit afraid of anything, as he wheeled about to face those who did and did not want his assistance in bringing about suffrage for women.

Where his sympathies were was not disclosed. Not once did he flinch or look at the clock. And when the time came during which the two opposing factions were busy with their rhetoric, he did not call out "Ladies, ladies, I beg of you!" He was simply moving all that was coming, and his mind was on the situation. As Mrs. Harriet Stanton Blatch, who marshalled the suffragists, began to explain that her ancestry had contributed much to the patriotic graveyards of the country, Governor Hughes unbentened his fresh coat, revealing a watch chain with key attachment in the centre of his black waistcoat.

The hearing was on. Governor Hughes was getting a finished touch in his public life.

Mrs. Anna Garland Spencer, in quaker gray, with a little bonnet and rubbing at her cuff, in a mild voice declared for the rights of women, smiling gently meanwhile; and Mr. Byrne, who seemed to impose the Governor as a new species of woman suffragist, talked in behalf of two hundred and fifty thousand men who, he said, could scarcely get along much longer without votes for women. Mr. Byrne, the boy-suffragist, was not quite so much as seated when there was a stir on the side of the enemy, the "antis." The

stirring was done by Mrs. William Crenell, large, important looking, and determined.

"But we are not through," ventured Mrs. Blatch.
 "Yes; but you are through with your time," retorted Mrs. Crenell, with foreboding menace.

Mrs. Crenell approached the table and turned a convincing eye upon the Chair. She pointed to her typewritten notes, after a few sections of speech, full of why women should not be given the ballot, and then she lost her piece. The table helped none. It was big, and wide, and long, and smooth, and she shuffled the sheets skillfully, but with little success. Three minutes of her time were consumed by confusion.

"I must have left that part here," she exclaimed. "But I can go on without it, and tell you what I have to say, sir."

"There are many names signed to some of the Suffragists' petitions than there are women in the cities and villages," she affirmed, with a defiant toss toward the "pros."

Mrs. George Phillips, the chairman of the "anti," got up to warn Mrs. Crenell that time was going, but Mrs. Crenell still had words unused. Again Mrs. Phillips arose, and then she did the same thing once more. She held a little watch behind a fat snuff, and the shadow of a picture had concealed the anxious twitching of her face. Another "anti" must speak, or soon it would be too late, and Mrs. Adeline Knapp, with spectacles, and morning glories in her hair, came forward with her argument against the woman's vote. Miss Knapp, it was said, wrote, or dramatized, or something like that, an arithmetic for use in the Philippines,—whether it was approved by the Kaiser or not was not made known to Suffragists who surrounded the gubernatorial table.

Once more it was Mrs. Phillips's turn to move.
 "We must go now," she explained: "we must hurry back to the Senate. Come, Miss Knapp."

"Not that we wish, but that we must," she said, with a sweeping gesture that included Governor Hughes in its exulting atmosphere.

His Excellency watched the trailing departure, and did not betray by so much as a twinkle the slightest amusement when one abandoned "anti" thrust a handkerchief and a toe-rubber in her muff, preparatory to a hasty exit.

Mrs. Blatch looked regretfully at her sitting opponents. She had so many trump cards that had not been used. One was Mrs. Florence Kelly. When Mrs. Kelly got up there was almost a nod of recognition from the Governor's Chair. Mrs. Kelly was one of the first women, by the way, who really have done things with Legislatures, and she was as natural and easy in her manner as if she had been saying a few words to a partner at bridge.

"When we get laws enacted, we cannot get them enforced," said Mrs. Kelly. "In Colorado the wishes of every working woman are counted just as much as the wishes of the Italian in New York who has stayed here long enough to get his citizenship."

The doorway was suddenly blocked by some visiting preachers who had spent the afternoon protesting faithfully against race-track betting; for the clock was now closing up the hour's work.

And Mrs. Blatch was talking in a sobbing. That is a very polite way of having the last word and knowing it, and it seems to be awfully popular at all gatherings of women.

"We are living in the eighteenth century," began Mrs. Blatch, impressively: "I mean the nineteenth,—no, the twentieth. We are living in the twentieth century and not the eighteenth, and we women, through no fault of our own, are out in the world as wage-earners and workers. We want to serve the community. Governor Hughes, hear in mind, Governor Hughes,—Governor Hughes, Governor Hughes, we do not ask you to declare for or against. We want an intelligent light on our work."

In a way she got all she asked for, as Governor Hughes did not declare for or against.

As the Governor's chair revolved the long fingers of the State Executive relaxed their hold upon each other.

"I have no direct power," he smiled. "I am glad your views were presented. I am a firm believer that anything that is right and makes for progress is bound to come."

The visiting preachers in the doorway thought this was good enough to be meant for them, but Governor Hughes was still addressing the Suffragists.

"If you proceed in an orderly manner without upheavals you will be rewarded. I believe heartily in debate as truth may emerge. Whatever is right will eventually appear to be right, and will be ultimately established. I firmly believe the decision will rest with women. What intelligent women want they will have. The demand on the part of women will in course of time be irresistible."

Governor Hughes bowed, and started forward. The women smiled and rushed to meet him, and everybody shook hands. In their excitement they did not forget to grip their umbrellas.

A preacher who had an Adam's apple which necessitated a cut-away collar asked Mrs. Blatch if she would not say something at the Bors Track hearing.

"Will you work for woman's suffrage?" she said.

"I? Certainly not," was the reply. "Women ought to be home. Besides, I have daughters to bring up."

Governor Hughes was a bit late for dinner. It was told in strict confidence. The reason is not really that Mrs. Hughes received the members, delegates, and all who were not talking, at the Executive Mansion from five to seven o'clock.

A Spirit in Prison*

A Novel

By Robert Hichens

AUTHOR OF "THE GARDEN OF AILAN," "THE CALL OF THE BLOOD," ETC.

CHAPTER I

THE SPIRIT THAT BENTH UPON A LIFE IN A SPIRIT IN PRISON

SOMEWHERE, not far off on the still sea that held the tiny islet in a warm embrace, a boy's voice was singing "Napoli Bella."

Vere heard the song as she sat in the sun with her face set towards Naxos and the distant peak of Ios; and instinctively she shifted her position, and turned her head, looking towards the calm and untroubled water that stretched between her and Naples. For the voice that sang

of the beautiful city was coming towards her from the beautiful city, hushing the shores it had left perhaps but two hours ago.

On his pedestal set upon rock San Francesco seemed to be attentive to the voice. He stood beyond the sheltered pool of the sea that divided the islet from the mainland, staring across at Vere as if he envied her; he was now rooted in Italy and deprived of her exquisite freedom. His head hung down to his waist, his cross protruded over his left shoulder, and his robe of dusty grayish brown touched his feet, which had never wandered one step since he was made, and set there to keep watch over the fishermen who come to sleep under the lee of the island by night.

Now it was brilliant daylight. The sun shone vividly over the Bay of Naples, over the great and vital city, over Vesuvius, the long line of the land towards Sorrento, over Capri with its shadowy mountain, and Posillipo, with its tree-groved villas. And in the sharp radiance of May the careless voice of the sailor-boy sang the familiar song that Vere had always known and seldom heard.

Today, why she did not know, Vere listened to it intently. Something in the sound of the voice caught her attention, roused within her a sense of sympathy.

Curiousness and happiness made a swift appeal to young hearts, and this voice was careless, and sounded very happy. There was a delicate gracefulness in it, a determination to be manly, which proved the vocalist to be no man. Vere knew at once that it was singing, and she felt that she must see him.

She got up, went into the little garden at the edge of the cliff, and looked over the wall.

There was a boat moving slowly towards her, not very far away. In it were three figures, all stripped for diving, and wearing white cotton drawers. Two were sitting on the gunwale with their knees drawn up nearly to their chins. The third was standing, and with a languid but strong and regular movement was propelling the boat forward with high-bladed oars. This was the singer, and as the boat drew nearer Vere could see that he had the young, lithe form of a boy.

While she watched, leaning down from her eyrie, the boat and the song stopped, and the singer let go his oars and turned to the men behind him. The boat had reached a place near the rocks that was good ground for *fratelli di mare*.

Vere had often seen the divers in the Bay of Naples at their curious toil. Yet, it never ceased to interest her. She had a passion for the sea, and for all things connected with it. Now she leaned a little lower over the wall, with her eyes fixed on the boat and its occupants.

Upon the water she saw corks floating, and presently one of the men swung himself round and sat facing the sea, with his back to the boat and his bare legs dipping into the water. The boy had dropped down to the bottom of the craft. His hands were busy arranging clothes, or tackle, and his body once again rang out to the glory of "Napoli, bella Napoli." There was something infectious in his happy-go-lucky light-heartedness. Vere smiled as she listened, but there was a wildness in her heart. At that moment a very common desire of young and vigorous girls assailed her—the desire to be a boy; not a boy born of rich parents, destined to the idle, aimless life of aristocratic young Neapolitans, but a brown, badly dressed, or scarcely at all dressed, boy of the people.

She was often light-hearted, careless. But was she ever as light-hearted and careless as that singing boy? She supposed herself to be free, that was she, could she ever be as free as he was?

The man who had been dipping his feet in the sea rested one hand on the gunwale, let his body draw forward, dropped into the water, paddled for a moment, reached one of the floating corks, turned over head downwards, describing a circle which showed his chocolate-colored back arched, kicked up his feet and disappeared. The second man lounged lazily from the boat into the sea and imitated him. The boy sat still and went on singing.

Vere felt disappointed. Was not he going to dive too? She wanted him to dive. If she were that boy she would go in, she felt sure of it, before the men. It must be lovely to sink down into the underworld of the sea, to ride from the rocks their fruit, that grew thick as fruit on the trees. But the boy—he was lazy, good for nothing but singing. She was half ashamed of him. Whimsically, and laughing to herself at her own absurdity, she lifted her two hands, brown with the sun, to her lips, and cried with all her might:

"Va dentro, pazzo! Va dentro!"

As her voice died away, the boy stopped singing, sprang into the sea, kicked up his feet, and disappeared.

Vere was conscious of a thrill that was like a thrill of triumph. "He obeyed me!" she thought.

A pleasant feeling of power came to her. From her eyrie on the rock she was directing those strange sea doings. She was ruling over the men of the sea.

The empty boat swayed softly on the water, but its three former occupants were all hidden by the sea. It seemed as if they would never come up again. Vere began to hold her breath as they were holding theirs. At last a dark head rose above the surface, then another. The two men paddled for a minute, drawing the air into their lungs. But the boy did not reappear.

As the seconds passed, Vere began to feel proud of him. He was doing that which she would have tried to do had she been a boy. He was rivaling the men.

Another second slipped away—and another. He was more than rivaling; he was besting the men.

They dived once more. She saw the sun gleam on their backs, which looked polished as they turned slowly over, almost like brown porpoises.

But the boy remained hidden beneath the veil of water.

Vere began to feel anxious. What if some accident had happened? What if he had been caught by the seaweed, or if his groping hand had been retained by some crinoid of the rock? There was a pain at her heart. Her quick imagination was at work. It seemed to her as if she felt his agony, took part in his struggle to regain his freedom. She clenched her small hands and set her teeth. She held her breath, trying to feel exactly as he was feeling. And then suddenly she lifted her hands up to her face, covering her nostrils. What a horrible sensation it was. This suffocation, this pressing of the life out of the body, almost as one may push a person brutally out of a room! She could bear it no more, and she dropped her hands. As she did so the boy's dark head rose above the sea.

Vere uttered a cry of joy.

"Bravol! Bravol!"

She felt as if he had returned from the dead. He was a wonderful boy.

"Bravol! Bravissimo!"

Seriously unconscious of her enthusiasm, the boy swam slowly for a moment, breathing the air into his lungs, then swamly dived again.

"Vere!" called a woman's voice from the house—"Vere!"

"Madre!" cried the girl in reply, but without turning away from the sea. "I am here! Do come out! I want to show you something!"

On a narrow terrace looking towards Naples a tall figure appeared.

"Where are you?"

"Here! Here!"

The mother smiled and left the terrace, passed through a little gate, and almost directly was standing beside the girl, saying:

"What is it? Is there a school of whales in the bay, or have you sighted the sea serpent coming from Capri?"

"No, not! But—see that boat!"

"Yes. The men are diving for *fratelli di mare*, aren't they?"

Vere nodded.

"The men are nothing. But there is a boy who is wonderful."

"Why? What does he do?"

"He stays under water an extraordinary time. Now wait. Have you got a watch, Madre?"

"Yes."

"Take it out, there's a darling, and time him. I want to know—there he is. You see?"

"Yes."

"Have you got your watch? Wait till he goes under! Wait a minute! There! He's gone! Now begin."

She drew into her lungs a long breath, and held it. The mother smiled, keeping her eyes obediently on the watch which lay in her hand.

There was a silence between them as the seconds passed.

* Copyright, 1907 by HARRIS & BROTHERS.

"Really," began the mother, presently, "he must be—"

"Hush, Madre, hush!"

The girl had clasped her hands tightly. Her eyes never left the sea. The tick, tick of the watch was just audible in the stillness of the May morning. At last—

"There he is!" cried the girl. "Quick! How long has he been under?"

"Sixty seconds."

"I wonder—I'm sure it's a record. If only Gaspare were here! When will he be back from Naples with Monsieur Emile?"

"About twelve, I should think. But I doubt if they can sail." She looked out to sea, and added: "I think the wind is changing to southwest. They may be later."

"He's gone down again!"

"I never saw you so interested in a diver before," said the mother. "What made you begin to look at the boy?"

"He was singing. I heard him, and his voice made me feel—"

"She paused."

"What?" said her mother.

"I don't know. I'm *però disincantata*, I'm afraid. One thing, though! It made me feel to be a boy."

"Did it?"

"Yes, Madre, tell me truly—sea water on your lips, as the fishermen say—now truly, do you ever want me to be a boy?" Hermione Delaney did not answer for a moment. She looked away over the still sea, that seemed to be slowly losing its color, and she thought of another sea, of the Ionian waters that she had loved so much. They had taken her husband from her before her child was born, and this child's question recalled to her the sharp agony of those days and nights in Sicily, when Massimo lay injured in the *Casa del Prete*, and afterwards in the hospital at Marchese—of other days and nights in Italy, when, isolated with the Sicilian lady, Gaspare, she had waited patiently for the coming of her child.

"Sea water, Madre, sea water on your lips!"

Her mother looked down at her for a moment.

"Do you think I wished it, Vere?"

"Today I do."

"Why to-day?"

"Because I wish it so much. And it seems to me as if perhaps I wish it because you once wished it for me. You thought I should be a boy?"

"I felt sure you would be a boy."

"Madre! How strange!"

The girl was looking up at her mother. Her dark eyes—almost Sicilian eyes they were—opened very wide, and her lips remained slightly parted after she had spoken.

"I wonder why that was?" she said at length.

"I have wondered too. It may have been that I was always thinking of your father in those days, recalling him—well, recalling him as he had been in Sicily. He went away from me so suddenly that I remember his going, even when it had happened, for a long time seemed to be an impossibility. And I fancied, I suppose, that my child would be him in a way."

"Come back!"

"Or never quite gone."

The girl was silent for a moment.

"Povera madre mia!" at last she said.

But she did not seem distressed for herself. No personal grievance, no doubt of complete love, assailed her. And the fact that this was so demonstrated, very quietly and very completely, the relation existing between this mother and this child.

"I wonder, now," Vere said, presently, "why I never specially wished to be a boy in to-day—because, after all, it can't be from you that the wish came. If it had been it must have come long ago. And it didn't. It only came when I heard that boy's voice. He sings like all the boys, you know, that have ever enjoyed themselves, that are still enjoying themselves in the sun."

"I wish he would sing once more," said Hermione.

"Perhaps he will. Look! He's getting into the boat. And the men are stopping too."

The boy was very quick in his movements. Almost before Vere had finished speaking he had pulled on his blue jersey

and white trousers, and again taken the big oars into his hands. Standing up, with his face set towards the boat, he began once more to propel the boat towards it. And as he swung his body slowly in and fro he opened his lips and sang softly once more,

"O Napoli, bella Napoli!"

Hermione and Vere sat silently listening as the song grew louder and louder, till the boat was almost in the shadow of the pier, and the boy with a strong stroke of the left oar turned its prow towards the pool over which San Francisco watched.

"They're going into the Saint's Pool to have a swim," said Vere. "Isn't he a splendid boy, Madre?"

As she spoke the boat was passing almost directly beneath them, and they saw its name painted in red letters on the prow, *Sirena del Mare*. The two men, one young, one middle aged, were staring before them at the oars. But the boy, more sensitive, perhaps, than they were to the watching eyes of women, looked straight up to Vere and to her mother. They saw his level rows of white teeth gleaming as the song came out from his parted lips, the shining of his eager dark eyes, full of the endless meriment of youth, the black, bushy hair stirring in the light sea breeze about his brow, bronzed by sun and wind. His slight figure swayed with an easy motion that had the grace of perfectly controlled activity, and his brown hands gripped the great oars with a firmness almost of steel, as the boat glided under the lee of the island, and vanished from the eyes of the watchers into the shadowy pool of San Francisco.

When the boat had disappeared, Vere lifted herself up and turned round to her mother.

"Isn't he a jolly boy, Madre?"

"Yes," said Hermione.

She spoke in a low voice. Her eyes were still on the sea where the boat had passed.

"Yes," she repeated, almost as if to herself.

For the first time a little cloud went over Vere's sensitive face.

"Madre, how horribly I must have disappointed you," she said. "The mother did not break into pre-eminence. She always treated her child with sincerity."

"Just for a moment, Vere," she answered. "And then, very soon, you made me feel how much more intimate can be the relationship between a mother and a daughter than between a mother and any son."

"Is that true, really?"

"I think it is."

"But why should that be?"

"Don't you think Monsieur Emile could tell you much better than I? I feel all the things, you know, that he can explain."

There was a touch of something that was like a half hidden irony in her voice.

"Monsieur Emile? Yes, I think he understands almost everything about people," said Vere, quite without irony.

"But could a man explain such a thing as well as a woman? I don't think so."

"We have the instincts perhaps, men the vocabulary."

"Come, Vere, I want to look over into the Saint's Pool and see what those men are doing."

Vere laughed.

"Take care, Madre, or Gaspare will be jealous."

A soft look came into Hermione's face.

"Gaspare and I know each other," she said, quietly.

"But he could be jealous—horribly jealous."

"Of you, perhaps, Vere, but never of me. Gaspare and I have passed through too much together for anything of that kind. Nobody could ever take his place with me, and he knows it quite well."

"Gaspare's a darling, and I love him," said Vere, rather incoherently.

"Shall we look over into the pool from the pavilion, or go down by the steps?"

"We'll look over."

They passed in through a gateway to the narrow terrace that fronted the *Casa del Mare*.

After Veronius, entered the house, traversed a little hall, came out again into the air by a door on its farther side, and made their way to a small pavilion that looked upon the Pool of San Francisco.

Almost immediately before, in the cool shadow of the cliff, the boat was moored. The two men,

He lifted his brown arms above his head, uttered a cry, and dove cleanly below the surface

lying at full length in it, their faces buried in their hands, were already asleep. But the boy, sitting astride on the prow, with his bare feet dangling on each side of it to the clear green water, was manning slowly, and rather seriously, a bunch of yellow bread, from which he cut from time to time large pieces with a clasp knife. As he ate, lifting the pieces of bread to his mouth with the knife, against whose blade he held them with his thumb, he stared down at the depths below, transparent here almost to the sea bed. His eyes were wide with reverie. He seemed another boy, not the gay singer of five minutes ago. But then he had been in the blaze of the sun. Now he was in the shade. And swiftly he had caught the influence of the dimmer light, the lack of motion, the delicate blush at the feet of San Francesco.

This time he did not know that he was being watched. His reverie, perhaps, was too deep, or their gaze less concentrated than it had been before. And after a moment Hermione moved away.

"You are going in, Madre?"

"Yes."

"Do you mind if I give something to that boy?"

"Do you mean money?"

"Oh, no. But the poor thing's eating dry bread, and—"

"And what, you mean?"

"Well, he's a very obedient boy."

"How can you know that?"

"He was idling in the boat, and I called out to him to jump into the sea, and he jumped in immediately."

"Do you think because he heard you?"

"Certainly I do."

"You conceived little creature! Perhaps he was only pleasing himself!"

"No, Madre, no. I think I should like to give him a little reward presently—for his singing, too."

"Get him a dove, or a cat, from Carmela, if there is one. And you can give him some cigarettes."

"I will. He'll love that. Oh dear! I wish he didn't make me dissatisfied with myself!"

"Nonsense, Vere!"

Hermione bent down and kissed her child. Then she went rather quickly away from the pavilion and entered the Casa del Mare.

CHAPTER II

AFTER her mother had gone, Vere waited for a moment, then ran lightly to the house, procured herself of a dove and a packet of cigarettes, and went down the steps to the Pied of San Francesco, full of hospitable intentions towards the singing boy. She found him still sitting astride of the boat's prow, not yet free of his reverie, apparently; for when she gave a low call of "Proccatori!" prolonging the last syllable with the emphasis and the accent of Naples, but always softly, he started, and nearly dropped into the sea the piece of bread he was lifting to his mouth. Recovering himself in time to save the bread deftly with one brown hand, he turned half round, leaning on his left arm, and stared at Vere with large, inquiring eyes. She stood by the steps and beckoned to him, lifting up the packet of cigarettes, then pointing to his sleeping companion.

"Come here for a minute!"

The boy smiled, sprang up, and leaped on to the inlet. As he came to her, with the easy, swinging walk of the barefooted sea people, he pulled up his white trousers, and threw out his chest with an obvious desire to show before the pretty Padrona of the inlet. When he reached her he lifted his hand to his bare head thoughtfully, meaning to take off his cap to her. Finding that he had no cap, he made a laughing grimace, threw up his chin, and, thrusting his tongue against his upper teeth and opening wide his mouth, uttered a little sound most characteristically Neapolitan—a sound that seemed lightly commendatory of himself. This done, he stood still before Vere, looking at the cigarettes and at the dove.

"I've brought these for you," she said.

"Grazie, signorina."

He did not hold out his hand, but his eyes, now devoted entirely to the cigarettes, began to shine with pleasure. Vere did not give him the presents at once. She had something to explain first.

"We mustn't wake them," she said, pointing towards the boat in which the men were sleeping. "Come a little way with me."

She retraced a few steps from the sea, followed closely by the eager boy.

"We shan't disturb them now," she said, stopping. "Do you know why I've brought you these?"

She stretched out her hands, with the dove and the cigarettes.

The boy threw his chin up again and half shut his eyes.

"No, signorina."

"Because you did what I told you."

She spoke rather with the air of a little queen.

"I don't understand."

"Didn't you hear me call out to you from up there?"—she pointed to the cliff above their heads—"when you were sitting in the boat? I called to you to go in after the men."

"Why?"

"Why! Because I thought you were a lazy boy."

He laughed. All his brown face gave itself up to laughter—eyes, teeth, lips, cheeks, chin. His whole body seemed to be spiriting. The idea of his being lazy seemed to delight his whole spirit.

"You would have been lazy if you hadn't done what I told you," said Vere, emphatically, forcing her words through his merriment with determination. "You know you would."

"I never heard you call, signorina."

"You didn't?"

He shook his head several times, bent down, dipped his fingers in the sea, put them in his lips: "I say it."

"Really?"

There was a note of disappointment in her voice. She felt threatened.

"But then, you haven't earned these," she said, looking at him almost with rebuke, "if you want in of your own accord."

"I go in because it is my mother, signorina," the boy said, simply. "I go in by force."

He looked at her and then again at the cigarettes. His expression said, "Can you refuse me?" There was a quite definite and conscious attempt to enoble her to generosity in his eyes, and in the pose he assumed. Vere saw it, and knew that if there had been a mirror within reach at that moment the boy would have been looking at itself, frankly admiring himself.

In Italy the narcissus blooms at all seasons of the year.

She was charmed by the boy, for he did his baring well, and she was susceptible to all that was naturally picturesque. But a gay little spirit of resistance sprang up like a flame and danced within her.

She let her hands fall to her sides.

"But you like going in?"

"Signorina?"

"You enjoy diving?"

He shrugged his shoulders, and again used what seemed with him a favorite expression.

"Signorina, I must enjoy it, by force."

"You do it wonderfully. Do you know that? You do it better than the men."

Again the conscious look came into the boy's face and body, as if his soul were fairly swaying.

"There is no one in the bay who can dive better than I can," he answered. "Giovannino thinks he can. Well, let him think so. He would not dare to make a bet with me."

"He would lose it if he did," said Vere. "I'm sure he would. Just now you were under water nearly a minute by my mother's watch."

"Where is the signora?" said the boy, looking round.

"Why do you ask?"

"Why, I can stay under longer than that."

"Now look here!" said the girl, eagerly. "Never mind Madre! Go down once for me, won't you? Go down once for me, and you shall have the dove and two packets of cigarettes."

"I don't want the dove, signorina; a dove is for women," he said, with the complete bluntness characteristic of southern Italians and of Sicilians.

"The cigarettes, then."

"Yes, hear, that the water is too shallow here."

"We'll take my boat."

She pointed to a small boat, white with a green line, that was moored close to them.

"Yes, hear," said the boy again.

He pulled his white trousers up above his knees, stripped off his blue jersey, leaving the chest vest that he wears beneath it folded the jersey neatly and laid it on the stones, tightened his trousers at the back, then caught hold of the rope by which Vere's boat was moored to the shore, and pulled the boat in.

Very carefully he helped Vere into it.

"I know a good place," he said, "where you can see right down to the bottom."

Taking the oars, he slowly paddled a little way out to a deep, clear pool of the sea.

"I'll go in here, signorina."

He stood up straight, with his feet planted on each side of the boat's prow, and glanced at the water intently, as might a fish. Then he shot one more glance at Vere and at the cigarettes, made the sign of the cross, lifted his brown arms above his head, uttered a cry, and dived cleanly below the surface, going down obliquely till he was quite lost in the water.

Vere watched him with a deep attention. This feat of the boy fascinated her. The water between them made him look remote, delicate, and unearthly—neither boy nor fish. His head, she could see, was almost touching the bottom. She fancied that he was actually touching bottom with his hands. Yes, he was. Bending low over the water, she saw his brown fingers, stretched out and well defined, promoung over the basin of the sea as lightly and springily as the claws of a crab tiptoeing to some hiding place. Presently he let himself down a little more, pressed his flat palms against the ground, and, with the impetus thus gained, made his body shoot back towards the surface first foremost. Then bringing his body up till it was in a straight line with his feet, he came slowly upward, never moving first in this direction, then in that, with a little ease that was radiantly graceful. Finally he turned over on his back and sank slowly down until he looked like a corpse lying at the bottom of the sea.

Then Vere felt a sickness of fear steal over her, and, leaning over the sea till her face almost touched the water, she cried out, fiercely:

"Come up! Come up! Presto! Presto!"

As the boy had seemed to obey her when she cried out to him from the summit of the cliff, so he seemed to obey her now.

When her voice died down into the sea depths he rose from those depths, and she saw his eyes laughing, his lips laughing at her, from under the strange veil of the water, which had cast upon him a spectral aspect, the likeness of a thing dashed by its soul.

"Did you hear me that time?" Vere said, rather eagerly.

The boy lifted his dark head from the water to shake it, drew a

long breath, trod water, then threw up his chin with the touch of tongue against teeth which is the Neapolitan negative.

"You didn't! Then why did you come up?"

"He swam to the boat."

"It pleased me to come."

She looked doubtful.

"I believe you are birlante," she said, slowly. "I am nearly sure you are."

The boy was just getting out, pulling himself up slowly to the boat by his arms, with his wet hands grasping the gunwale firmly. He looked at Vere, with the salt drops running down his sunburnt face and dripping from his thick, matted hair to his strong neck and shoulders. Again his whole face laughed, as, nimbly, he brought his legs from the water and stood beside her.

"Birlante, signorina?"

"Yes. Are you from Naples?"

"I come from Mergellina, signorina."

Vere looked at him half doubtfully, but still with innocent admiration. There was something perfectly fearless and capable about him that attracted her.

He roved in to shore.

"How old are you?" she asked.

"Sixteen years old, signorina."

"I am sixteen, too."

"They rescued the boat, and Vere got out. The boy followed her, fastened the boat, and moved away a few steps. She wondered why, till she saw him stop in a sun patch and let the beams fall full upon him.

"You aren't afraid of catch-lag cold?" she asked.

"I am sixteen, too."

"They rescued the boat, and Vere got out. The boy followed her, fastened the boat, and moved away a few steps. She wondered why, till she saw him stop in a sun patch and let the beams fall full upon him.

"You aren't afraid of catch-lag cold?" she asked.

"I am sixteen, too."

"They rescued the boat, and Vere got out. The boy followed her, fastened the boat, and moved away a few steps. She wondered why, till she saw him stop in a sun patch and let the beams fall full upon him.

"You aren't afraid of catch-lag cold?" she asked.

"I am sixteen, too."

"They rescued the boat, and Vere got out. The boy followed her, fastened the boat, and moved away a few steps. She wondered why, till she saw him stop in a sun patch and let the beams fall full upon him.

"You aren't afraid of catch-lag cold?" she asked.

"I am sixteen, too."

"They rescued the boat, and Vere got out. The boy followed her, fastened the boat, and moved away a few steps. She wondered why, till she saw him stop in a sun patch and let the beams fall full upon him.

"You aren't afraid of catch-lag cold?" she asked.

"Ruffo—that's a nice name. It sounds strong and bold"

which she considered him carefully. "You can't get anything more out of that one."

"Grazie, signorina."

"He took it eagerly."

"Do tell me your name, won't you?" Vere went on.

"Ruffo, signorina."

"Ruffo—that's a nice name. It sounds strong and bold. And you live at Mergellina?"

"Si, signorina. But I wasn't born there. I wasn't born in Naples at all."

"Where were you born?"

"In America, signorina, near New York. I am a Sicilian."

"A Sicilian, are you?"

"Si, signorina."

"I am a little bit Sicilian, too; only a little thing bit—last still—"

She waited to see the effect upon him. He looked at her steadily with his long bright eyes.

"You are Sicilian, signorina?"

"My great-grandmother was."

"Si!"

His voice sounded incredulous.

"Don't you believe me?" she cried, rather hotly.

"Ma sì, signorina! only—that's not very Sicilian if the rest is English. You are English, signorina, aren't you?"

"The rest of me is. Are you all Sicilian?"

"Signorina, my mother is Sicilian."

"And your father, too?"

The boy's face suddenly clouded.

"Signorina, my father is dead," he said, in a changed voice. "Now I live with my mother and my stepfather."

He—Petrino—he is Neapolitan."

There was a movement in the boat. The boy looked round.

"I must go back to the boat, signorina," he said.

"Oh, must you?" Vere said. "What a pity! But look, they are really still asleep."

"I must go back, signorina," he protested.

"You want to sleep, too, perhaps?"

He seized the excuse.

"Si, signorina. Being under the sea so much—it tires the head and the eyes. I want to sleep, too."

His face, full of life, denied his words, but Vere only said:

"Here are the cigarettes."

"Grazie, signorina."

And I promised you another packet. Well, wait here—just here, if you see—under the bridge, and I'll throw it down, and you must catch it."

"Si, signorina."

He took his stand on the spot she pointed out, and she disappeared up the steps towards the house.

"Madre! Madre!"

Hermione heard Vere's voice calling below a moment later.

"What is it?"

There was a quick step on the stairs, and the girl ran in.

"One more packet of cigarettes—may I? It's instead of the dolce. Ruffo says only women eat sweet things."

"Ruffo?"

"Yes, that's his name. He's been diving for me. You never saw anything like it! And he's a Sicilian. Isn't it odd? And sixteen—just as I am. May I have the cigarettes for him?"

"Yes, of course. In that drawer there's a whole box of the ones Monsieur Emile likes."

"There! And I'll make him catch them all, one by one. It will be more fun than throwing only a packet. Addio, mia bella Madre! Addio! Addio!"

And singing the words to the tune of "Addio, mia bella Napoli," she fitted out of the room and down the stairs.

"Ruffo! Ruffo!"

A minute later she was leaning over the bridge to the boy, who stood sentinel below. He looked up and saw her laughing face full of merry mischief, and prepared to catch the packet she had promised him.

"Ruffo, I'm so sorry, but I can't find another packet of cigarettes."

The boy's bright face changed, looked almost sad, but he called up:

THE GENTLE ART OF SELF-DEFENCE

DRAWN BY GEORGES VALLER

An Embarrassed British Ambassador

How the Blunder of Tennyson pere Almost Caused Grave Diplomatic Complications

"Very few persons in Great Britain outside the diplomatic circle know a certain incident in our international history," said a British visitor of prominence in an American club room recently. "It arose from the fact that one of our citizens talked too much, and too vigorously, in the home of our ambassador to Russia, and in the presence of people who were eminent and powerful. He came very near losing his life; and he also came near causing a grave diplomatic breach between Russia and Great Britain."

"It happened in this way: Very soon after the death of the Czar Paul, the father of Lord Tennyson, the poet laureate, visited Moscow and was entertained by Lord St. Helens, the British ambassador to Russia. He was a guest at dinner one night, and several Russian officers of rank, whose names he did not know, were also guests. During the course of the dinner, several guarded references were made to the recent death of the Czar, and Mr. Tennyson exclaimed:

"Why do you speak so gingerly about a matter which is so notorious? It cannot be a state secret."

"Please do not discuss the subject," interposed Lord St. Helens. "Please say no more."

"Very well, then," said Mr. Tennyson; "but I must say that almost everybody in England knows that the Czar did not die a natural death, but that he was murdered. Count Zoloff knocked him down; Benningson and Count Pahlen then strangled him."

"Mr. Tennyson, you will please leave the table, and go to my private office," severely interrupted Lord St. Helens. Mr. Tennyson rose immediately, protesting that he saw no impropriety in his remarks nor in his conduct. As he left the room, Lord St. Helens said:

"Go to my private office, and remain there, Mr. Tennyson. You will consider yourself under arrest, by my orders."

"As soon as Mr. Tennyson disappeared, Lord St. Helens said:

"Gentlemen, I beg of you to believe me that I have had no conversation with Mr. Tennyson on this subject. You will surely understand that I could not and would not dare to invite you to be my guests, with the purpose of insulting you, nor of having you insulted. You are gentlemen of wisdom and experience in affairs. You know that any act of discourtesy by me or by my emissaries would either cause a breach between Russia and my country or it would cause my immediate recall and my downfall for life. Therefore, gentlemen, I beg of you to believe me that I am innocent of any intention of impugning you; and I hope that you will endeavor to put yourselves in my place, and realize how deeply humiliated I am."

"It is difficult to do so," replied the distinguished-looking officer who had been especially entreating to Mr. Tennyson. "Nevertheless, we shall try to understand, and we will discuss some other topic."

"Returning himself to his own quarters, Lord St. Helens went to his private office, and started the waiting Tennyson with this statement:

"Without delay, fly for your life. The men next to you, over whom you have triumphed, was Count Zoloff. Count Zoloff was also a guest at the table. My butler will attend you. Hurry! Go!"

"Mr. Tennyson rushed off in his hotel, threw his clothes into a portmanteau, and fled taking fast horses in the snow, all the while in evening dress, although the cold was intense. At Odessa he remained in hiding for several weeks. At last, in the disguise of a waiter, he succeeded in being smuggled aboard a British frigate, and returned to England in safety."

"Several months of diplomatic delay followed. The relations of Lord St. Helens with the Russian Foreign Office seemed to be perfectly pleasant. But it was only a question of time when he returned to his duties. The world never knew that his usefulness at Moscow was substantially over."

THE TIRELESS RIDER

He loves his hobby, Billy does,
And plans again to run,
(A hobby doesn't get ahead,
But then it's lots of fun.)

Chinese Rug Makers

HAND-MANUFACTURED rugs and carpets of silk, sheep's and camel's wool, yak hair, jute, hemp, and felt are largely manufactured in China, and especially in Tientsin and Peking. The industry has recently been introduced in several schools for the employment of the poor. The silk carpets are very like those produced in India, Turkey, or Persia in colors and quality of material, but vastly different in design if left to Chinese selection. Foreign designs, if furnished, are faithfully copied.

These rugs differ greatly in quality. In some the warp is cotton, while in others the warp, as well as the nap or wool, is silk. Some are made of even surface, while in others the figures are raised. The quality also differs in the number of warp threads used to the inch, which vary from 12 to 24. The cheapest are sold at from \$1.30 to \$1.50, Mexican, per square foot, while the better qualities readily bring from \$2 to \$3 per square foot. The quality most in demand, however, ranges in price from \$2 to \$2.40 per square foot. They are made in all sizes and are made for floor, table, and piano covers and wall draperies.

The wool rugs are in far greater demand and are largely used throughout China, Japan, and the East. Many are exported to Europe, and lately to America. They are made on the same loom and in the same manner as are the silk rugs. Those of all sheep's wool, with cotton warp, range in

price from 40 cents to \$2.50, Mexican, per square foot, the size, design, and color to suit the taste of the purchaser. The wearing qualities of these carpets make them a very commendable floor covering, and are soft, and blends the colors, which are, in all reliable places of manufacture, of vegetable dyes.

The carpets especially favored by the local residents and tourists are made from ram's wool, the prices ranging from 25 cents to \$1 per square foot. These rugs are heavy, and frequently are felted one-half an inch in thickness. They are fashioned in all kinds of designs—floral, geometrical, and dragon.

The rugs made from the other materials mentioned (the yak excepted) are used only by the natives and range in price from 1 to 25 cents per square foot. Those made from the hair of the yak are very rare and expensive, comparing in style and beauty with the finest silk rugs. They are made only in the interior provinces of China.

DETRA. "We can get a suit just like your mine's velvet suit for ten dollars in Bargain Brown Brothers."

NUGRA. "Yes, and I can get you for nothing," by telling me mine's about the size in Bargain Brown Brothers."

The Season's Plays

A NEW PLAYWRIGHT, AND A NEW "SHYLOCK"

By "I"

THE third act of the American play, "Paid in Full," which is now presented at the Actor Theatre, is one for which the author, Mr. Eugene Walter, deserves such commendation. The play, from beginning to end, is extremely well done both by playwright and company, and "with interest" ought well to be added to the title as an expression of what the audience derives from it.

The play deals with humble persons; humble, that is, in comparison with the "high society" folk one is accustomed to see strutting through the measures of a social drama. The reason for calling attention to Mr. Walter's third act is, that he has made it just what it should be, quick, alert, full of interest, and a striking climax of the play. After seeing it there was a reasonable suspicion that a fourth act might spoil the drama, at least might destroy the force of the third. However, Mr. Walter's fourth act does not mar his play in any way; if anything, it aids in accentuating the strength of the one which preceded it.

The compass of the play is a few months in the life of a young man, Joseph Brooks, an employee of a steamship company, whose surly, nervous disposition induces him to believe that everybody and everything is against him, that he is not being adequately remunerated for his services, that Fate has tied him by the leg. It is upon the woman who has the misfortune to be married to him that he vents his humors. How she has tolerated him up to the time the play opens is one of those things which no fellow can find out. A friend and fellow employee, "Jimmie" Smith, is rewarded by the company, but Brooks is passed over. This arouses Brooks to a scandalous and profane denunciation of the head of the steamship company, Captain Williams, upon the occasion of his visit to the Brooks flat in Harlem. Williams, who has been a sea captain, accustomed to meet such outbreaks of insubordination with a belaying pin, restrains himself with evident difficulty, but leaves the house.

Circumstances eventually become so intolerable to Brooks that he, having ready access to the company's money, steals several thousand dollars, moves himself and his wife to a semi-fashionable hotel, and provides himself thus with the comforts he upbraid Fate with having denied him. By way of explaining his new fortunes, Brooks tells his wife that if Williams has at last appreciated him and granted him not only a rise in salary, but back pay, so, apparently, everything in the Brooks household is going well.

But discovery comes and Williams is determined that his thieving employee shall pay for his dishonesty. He refuses to let Smith make restitution of the money, although Smith does succeed in causing the old sea captain to refrain from disclosing his discovery to Mrs. Brooks, who is full of gratitude to him for having advanced her husband. When Brooks learns that he has been found out, and that he has no means of escape or compromise, he suggests to his wife, of whom he knows Williams to be fond, that she go to the rooms of the old ferry captain and make a last effort to "square" him. With brutal frankness he tells her that if she does the thing properly she can save him. He leaves his room for doubt of what he means her to do. When she turns upon him, enraged and furious, Brooks taunts her with her unwillingness to do the one thing which will save him, and flings in her

face the statement that it was for her alone that he had stolen, and that it will be her fault if he goes to jail.

In order that she may not be held in the least way accountable for the theft Mrs. Brooks agrees to go to Williams' apartment that night, and the third act is devoted to the scene in Williams' sitting room. Before her arrival Williams writes something upon a bit of paper and puts it aside. After his exceptionally strong scene with the distraught woman, in which she professes him her life, and only her life, he tells her that had she been a woman of another kind she had never obtained from him what she wished. He adds, taking up the bit of paper, that he was sure she was the right kind of a woman, and in that belief had written a complete release of her unworthy husband.

The fourth act shows the return of the wife to Brooks and his suspicious inquiries as to her method of obtaining the paper. As she starts from the room, he even accuses her of intending to return to Williams. The curtain falls upon the miserable end sitting alone and despaired in his hotel room.

Of the players in the company only praise can be given. Miss Lillian Albertson as Mrs. Brooks was splendid in her scene with Captain Williams, and throughout the play gave such naturalness to her rôle. Mr. Tully Marshall as Brooks was so good that he was absolutely detestable. His temper and credulity were stimulated to a most convincing degree. The rôle of Captain Williams is in the hands of Mr. Frank Sheridan who played with both power and distinction. "Jimmie" Smith, who was Mr. Ben Johnson, made a strong appeal to sentiment. One should be willing to make a long journey to meet a man like "Jimmie" or Capt. Williams.

Mr. Henry Ludlow has recently given us an interpretation of Shylock at the Bijou Theatre, rendered, to quote his own descriptive pamphlet, "with the introspective quality of Ibsen, Maeterlinck, and Hauptmann, and presented with the New Thought." Let us accept Mr. Ludlow's work at its valuation and confront the problems which it induces: whether or not in this respect the universality of Shakespeare's genius permits us fully to interpret Shylock in the spirit of our own age.

New Shylockisms are an out-and-out monstrosity. He has pictured the common people almost invariably as vulgar clowns. It is improbable that he had ever seen a Jew other than Queen Elizabeth's physician, Lopez, as there were none in England. Therefore, there is no doubt that he drew Shylock as the type of bloodthirstiness and craft and greed; just as he made the Portuguese Jewbreaker Iago the generous, free-hearted merchant. It is noteworthy that all the more early actors accepted Shylock in his traditional rôle, till Keas reversed it and presented the more sympathetic rendering which is at present in favor. It is only by accepting the traditional reading of this part that we can interpret *despair*—unless, surely the most conscientious headline in all Shakespeare.

Mr. Ludlow capably denotes the bloodthirsty and crafty enemy of Antonio, his revenge never in the speech "To bait fish withal"; his wild, sarcastic vengeance at the trial scene. But his mild Shylock of the domestic hearth bows in depth by breadth of treatment.

As Portia, Miss Kethi Wakeham gave her own interpretation clearly and well, but she was not as compelling Portia, Mr. Arthur Forrest was wholly noticeable as Bassanio.

The Ordeal of "Mrs. Brooks," in "Paid in Full"
THE CRUCIAL SCENE IN MR. LUDLOW'S NEW PLAY

THREE'S A CROWD

DRAWN BY ROBERT R. BROWN

Keeping Tab on the Americans Abroad

UNDER an executive order of recent date, attention is drawn to the long standing consular regulation which requires that American citizens resident abroad shall register their names with their country's representatives.

The regulation requires principal consular officers to keep a register of American citizens residing in their several districts, to make known that such a register is kept, and to invite all resident Americans to register their names to be entered therein. Its object is to obtain a record of American citizens abroad, in order that the government may be better prepared to protect them by knowing who are entitled to protection, and to afford them an opportunity to make their American citizenship a matter of official record. The regulation provides that the same general principles govern applications for passports, and the department desires native as well as naturalized citizens to register. An American citizen residing abroad is held by the government to be entitled to its recognition as long as he maintains in good faith his American citizenship.

Out and In

I KNEW a faithful Belgian dog.
The kied you read about;
He saw his master drowning once,
And pulled him out.

Now this same dog got on the fence
With other mongrel kind;
He saw his master staggering home,
And pulled him in.

F. P. FITZGERALD

Decline of British Tars

ENGLAND has been seriously concerned over the shortage of seamen to man her merchant marine. Lascars have now largely supplanted the native product. During the last fifteen years there has been an increase of 11,163 of these East Indian seamen, as against only 310 Britishers. In consequence, the British government issued a notice recently that foreign seamen should not be engaged on British ships in European waters, unless they have enough knowledge of English to understand orders given in that language. It is stated that it has been no uncommon thing to find a ship's crew composed of eight or nine nationalities with absolutely no language in common, and perhaps a lieutenant who only understands English as "interpreter." The return relating to seamen employed in the British merchant marine shows thirty English and Irish per 10,000, while Scotland supplies fifty-six and Wales forty-four.

Hope

WALTER DAMROSCH tells of a matron in Chicago who, in company with her young nephew, was attending a musical entertainment.

The selections were apparently entirely unfamiliar to the youth; but when the "Wedding March" of Mendelssohn was begun he began to show interest. "That sounds familiar," he said. "I'm not strong on these classical pieces, but that's a good one. What is it?" "That," gravely explained the matron, "is the Maiden's Prayer."

London Wants Cats' Tails

THE stray cat, which has always been a common sight in London's streets, has begun to disappear. Poets is acquiring commercial value; her tail is now coming into use in the upholstery trade. The selling price varies from two to four cents a pound, and, owing to the shortage of the domestic supply, foreign quotations are being demanded by merchants. No samples will be accepted from the Isle of Man.

The COLONIA COLUMBIA SOUTH CAROLINA

HOTEL NOW OPEN

COLUMBIA, with The Colonia, is just a little bit more attractive than any other Winter Resort, and a whole lot more accessible.

Columbia is in the heart of the "Long-leaf Pine Region," more commonly known as the "Middle South," which is as to climatic conditions a happy medium between the languorous heat of Florida and the penetrating cold of the North. It's a day nearer home, and that's a good deal these times. Six through Pullman trains in and six out of Columbia each day.

Columbia is one of the loveliest and most characteristic cities of the South. It doesn't only tell you about the far-famed hospitality, but lets you experience it. Country Clubs are open to all guests of The Colonia, and always and everywhere there is an atmosphere of "Well, I'm glad you came down, and I hope you'll like us." Here, as in no other resort in the South, is to be found such environment.

Columbia is one of the healthiest cities in the world, located far above the sea-level and high above the surrounding country. The water and sewerage systems here are the most perfect.

Columbia offers all outdoor sports, and days of good weather in which to enjoy them. Golf, tennis, shooting, fox-hunting, etc., etc.

Columbia is one of the prettiest spots for all the thorough Florida tourist of the Southern Railway and the Seaboard Air Lines. It is also located on the through train from the West. It is only twenty minutes from Athens, Augusta, and Savannah, and only a short distance from such.

Our New York Booking Office will not only make reservations, but arrange for tickets, Pullman accommodations, etc.

THE COLONIA is the newest exponent of modern-resort-hotel construction, opened for the first time last season. It offers to the tourist just what he has only in isolated cases been able to obtain. It was built to take care of this particular class of long-suffering public, and does it. It is of brick construction, with every modern convenience. All rooms connect with private bath and have long-distance phone. All floors are hard wood. Public space is beautiful and well arranged. And it's all right every other way.

The Colonia is managed under the supervision of Mr. T. D. Green, of the Hotel Woodward of New York City, and of the exclusive Edgemoor Club of Long Island, which guarantees metropolitan service. Mr. L. H. Bingham, for years connected with the Anderson & Price interests, is personally managing The Colonia.

Address for descriptive booklet, etc.,

A Critical Examination of SOCIALISM

By W. H. MALLOCK

An admirable discussion of the entire subject of Socialism, pointing out with thorough fairness both the weak and strong points of the doctrine as it is understood in this twentieth century. It is a book that will serve the uninitiated reader as a first introduction to the subject, and will at once put him abreast of the most recent developments and up-to-date controversies of Socialism. The subject of modern wealth is treated with keen and illuminating analysis.

HARPER & BROTHERS, PUBLISHERS, N. Y.

THE LENGTHENING "BREAD LINE"

(Continued from page 12.)

that of Mr. Adolf Lorber, proprietor of the large restaurant in Grand Street. During the last six weeks he has been feeling an unlimited number of school children on the two upper floors daily at noon—no charity of kinders having this, but soup of the best quality, with great plates of meat and potatoes, and bread in unlimited quantities. At night the floors are filled with diners; in the daytime the thick carpets are hidden under a coating of sawdust, and hundreds of children, of all ages and sizes, make here what is probably their only substantial meal of the day.

"There is no limit," said the manager of the business. "They come from six or seven schools around, and we feed every child who has received a ticket from his teacher. Our first plan was to give free meals to all, but my very men had to give that up, for the streets were blocked with a mob no far back as Delancy Street, and people must have come from all parts of New York to feed at our expense. Then we instituted the system of tickets, to be distributed by the teachers, feeling that the teacher generally stands as closely to the child as its own parents—and often closer."

At least a thousand children take their lunch here, and will continue to do so, according to present arrangements, until the cold weather comes to an end.

"Mr. Lorber used to give away hundreds of dollars to charitable societies," the manager continued. "Now he has resolved to give in such a manner that he will know exactly where the money goes."

You can see it go, disappearing down hundreds of hungry throats. Almost at the noon hour little folks appear, as if by magic, running from all directions to fonn in line in front of the Lorber restaurant. A mounted policeman, who has been regulating the traffic, dismounts from his horse and takes charge of the queue. Boys and girls are represented in about equal numbers. And in the center of the line waves a square board, broader than any board that ever waved before the astonished eyes of Grand Street. Behind it, where should have stood a giant of the steppes is a little, wearied man.

"What are you doing here?" shouts the astonished manager.

"All right," says the owner of the board, with an ingenuitous smile.

"Get out of here. This dinner is for school-children."

"Yes, yes, school dinner. I go to night school."

The manager is almost overcome.

"Well, show me your ticket from your teacher, then," he gasps.

"Your ticket."

"Yes, yes, ticket," says the owner of the board. He adjusts his horn-rimmed spectacles and pulls out what is evidently a pass-

port from the Russian government—a dirty ancient document, covered with hieroglyphics in unknown characters.

"Get out of there," says the policeman, yanking him backward. He sets up a shrill protest, and the board wavers and flutters in the center of the crowd, to disappear in scarlet splendor amid the traffic.

"Finish your soup," the lady superintendent says in warning notes, as some laggards push their half-empty plates away from them. "Finish your soup or you don't get any more. Why don't you eat your soup, boy?"

It is "boy's" tragedy. He fingers his bread and stares at the soup in front of him, greedily snuffing the fragrant aroma. How warm and comforting that soup would be in its right quarters! And yet—is the soup kosher?

Around him, all inconspicuous of this horrible dilemma, the rest are gobbling at their victuals. And still he stares at that savory morsel in front of him, fascinated by the first glimpse of bread, splendid sin. The seven devils of hunger batter upon his vitals, and, like Prometheus, he fights against them.

"Well, if he won't eat it, take it away."

"Boy's" face relaxes. The battle is over; he has fought and conquered. And yet, if it hadn't been taken from him—

"I don't know what's the matter with some of their appetites," says the lady superintendent fretfully.

Another charity to which the attention of late-watching New Yorkers is often attracted is that of the evangelist of Madison Square. He is a jolly, good-natured fellow, stout of chest and with a premonitory tinge. He plants an old soup-bowl, soon after theatre close, in the shadow of the Worth monument and climbs upon it. There for at least half an hour he preaches, doing as much as he can for the good of the souls of the vaids and strays assembled, and stopping now and then to take up a collection, so that he can provide for the wretched a lodging for the night.

Often he preaches for many minutes to the empty air. Sad eyes are watching from afar. Now a group of those who have stopped late stand up. They pause. The orator reminds them of their luxurious luck, their comfortable housing, the excellent meal from which they have come, then shivers, and asks what they will do for their fellow-men who are driven to rest on black trunks and in frosty doorways. The full-fed are responsive. One steps up to the soup-bowl and hands half a dollar to the orator. His companions follow the example.

Now is the evangelist's opportunity. At the first sign of alms a shivering, shivering horde assembles as if by magic. From dark doorways and from the park benches and out from the shade of the Farragut statue they sink and shuffle with all the haste their sodden and stiffened limbs will allow. They have no taste for preaching, only for warm lodgings.

Addresses

TAKE you ever cheered?" asked the man crosses twice a year, "how we have it he British in the matter of addresses? For instance, a New Yorker will give address in this extraordinary compact ion:

Philip Robinson,
200 W. 81st Street, N. Y.

But your travelling Briton may have to efface himself somewhat after the following style:

Herbert H. Kistare W. Plunket-Ferguson,
Q.C., GUMED, C.B.,
The Sturdy,
3 Tankerville Terrace,
Helmheim Road, Mowbray Street,
Kensington, W. London, Eng.

In olden times, before the system of set numbers had been introduced at all, cities were still a maze of little streets, lanes were a very complicated affair, one saw an authentic specimen of a provisional card of the year 1768. It was that of a celebrated French engraver. It like this:

Papillon,
graver on Wood of the Society of Arts,
rue: Hibern Street, near the place Mar-
bert,
at door to the porte cochere on the right,
in the long alley,
the second floor up the grand staircase."

Didn't Want to Pay More

"You're fined ten dollars for contempt of court."
"I'm glad, judge, that this is not a higher sum."

Incog

The proprietor of a Chicago hotel tells of an eccentric guest who registered with him about the time of the simplified spelling flurry, and who undertook, in an ingenious way, to show his contempt for the proponents of the proposed reform.

"When the newcomer spread his signature on the register, it was at once observed that he made a most unusual one—"E. K. 'thologymrth."

"I beg your pardon, sir," said the clerk, "but how do you pronounce it?"

"Turner," was the reply, "and spelled in reversed fashion, too."

"Will you kindly explain?"

"Simplest thing in the world," said Turner. "First, we have 'pth', the sound of 't' in 'ptals'; then, 'eo', the sound of 'e' in 'eual'; thirdly, 'gn', representing the sound of 'a' in 'gnal'; and, finally, 'yrth', the equivalent of 'er' in 'myth'. If the combination doesn't spell 'Turner,' what does it spell?"

The Key to the Whisk

DE KYLE: "Prohibition is sweeping the States."

GI NEUSTA: "Must be sweeping it with a windy broom, I guess."

Migration of Sea Fish

CONSIDERABLE interest has been aroused in the west coast of France by the appearance of a number of fish hitherto unknown in those waters, though common in America—among them being the sheep-head and bluefish. Shad are also present, but this is due to their culture in the streams emptying into the Bay of Biscay. The unexpected find appears to differ slightly in form and color from its American ancestors.

Discoveries in Every-Day Europe

By DON C. SEITZ

The author, with shrewdness and observant humor, has done that impossible thing, written a new kind of book about Europe. It is a pure fun, original, humorous, American work, a book of delicious chuckles, not a guide book. And the pictures are as funny as the writing—nearly—and that is saying a lot. It skips all over Europe, hitting in everywhere the sunshine of a laugh.

Illustrated with Pen-and-ink Sketches. Price, \$1.50

TEN TO SEVENTEEN

A Book of Fun

The Future in America

By H. G. WELLS

Mr. Wells's recent visit to America has added to him to view our country with interest and not unkindly eyes. With rare insight he has grasped American conditions as no one else has done. He puts into graphic and picturesque language much that we as Americans have felt, but only dimly comprehended, and striking but convincing chapters show what America is becoming.

HYPNOTIC THERAPEUTICS

By John D. Quackenbos, A.M., M.D.

Member of the London Society for Psychical Research; Fellow of the New York Academy of Medicine; Member of the New York Academy of Sciences

As a narrative and a record of humanity most startling psychopathic cases, ranging from this book will impress and amaze all sorts of the mere pain of abnormal bashfulness to the readers. It is a complete and careful exposition of the hypnotic theory of treatment. Many of the cases have stirred public attention in the newspapers. Here they are treated scientifically and in language to hold the interest of every reader. In this volume Dr. Quackenbos tells the result of over seven thousand personal experiences which have led him to the positive conviction that hypnotism is the greatest regenerative force of the age. *tism in Mental and Moral Culture and Practical Physics.* This new work is a distinct advance—the

*Hypnotism as the
great regenerative
force of the age*

*Based on 7000
experiences with
hypnotic treatment*

STORY of HYPNOTISM

Dr. Quackenbos puts forward the theory that, by Hypnotic Treatment, it is easy to restrain a kleptomaniac, not to make an honest man steal. Another most interesting argument advances the belief that this very century may demonstrate immortality itself by supermental communication, banish disease, and bestow painless dying. The already established scientific facts of hypnotism are followed up with the contention that, ethically, what it really means is the pure, free man coming to himself, and not the outside influence of another's will power—hence there is no possibility that evil can result from its application. There is a widespread public demand for full and authentic information regarding the principles of Hypnotic

Suggestion, which has become appreciated at its true worth as a great curative instrumentality in the fields of medicine and psychiatry, and as a regenerating power in that of criminal anthropology.

JOHN D. QUACKENBOS, A.M., M.D.

Dr. Quackenbos's book presents a Personal Experience which, in variety, general interest, and sociological promise, has never been equalled.

It explains the principles of Hypnosis and Rapport, and the rational methods of inducing the suggestible state.

It discusses Sleep and Degrees of Suggestibility; Suggestion and Auto-Suggestion, and their relation to Christian Science, Mental Science, Faith Cures, Osteopathy, Christian Faith, and Responsibility, with a summary of experiences.

HARPER & BROTHERS, NEW YORK

If my Razor wasn't good enough for me to use I wouldn't ask you to try it!

You certainly cannot doubt the sound logic and wisdom of the many arguments I have advanced in favor of my razor.

You will admit that unless the "GILLETTE" possessed many points of superiority it never would have been accepted by two million men in the past three years as the best, most simple and satisfactory shaving device in this world.

In the first place my razor requires **No Stropping, No Honing.**

It is always ready. That's why it's the most practical. You can shave in three to five minutes.

The thin, flexible, double-edged blades remove a harsh or soft beard with perfect comfort. No pulling, cutting or irritation of the skin. They are so inexpensive that when dull you throw them away as you would an old pen. No other razor so durable. The triple silver-plated holder lasts a lifetime. None so convenient; the compact little case can be with you always—if travelling, either in your pocket or grip.

I know men who have shaved in the dark with the "Gillette." Many use it on the train, others while on hunting-trips, fishing expeditions, etc. That's the beauty of my razor, you can obtain a perfect shave under all conditions—wherever you are.

And I will guarantee you will agree with me right now—that my razor just fits your case. A trial will prove it to you.

Action must accompany right thinking or you have no power of execution.

Put this correct line of thought into action. Get a "Gillette" to-day. All Jewelry, Drug, Cutlery, Hardware and Sporting Goods dealers sell it.

King Gillette

The Gillette Safety Razor Set consists of a triple silver-plated holder, 12 double-edged flexible blades—24 keen edges—packed in a velvet-lined leather case, and the price is \$5.00.

Combination Sets from \$6.50 to \$50.00

Ask your dealer for the "GILLETTE" to-day. If substitutes are offered, refuse them and write us at once for our booklet and free trial offer.

STORIES OF SYMPHONIC MUSIC

A Guide to Modern Orchestral Programme-Music

By LAWRENCE GILMAN

Music Critic of "Harper's Weekly"

This book fills a genuine need of the music-lover, for it offers in compact, accessible, and easily intelligible form information which will help him to listen understandingly to the music of an orchestral concert. It presents clearly and without technical analysis the poetic or pictorial or dramatic basis of every important example of programme-music in the symphonic repertoire, putting the reader in possession of information which will enable him to listen comprehendingly, for example, to a symphony by Berlioz, an overture by Mendelssohn, a symphonic poem by Liszt, or a tone-poem by Strauss or Debussy.

"The best thing for every concert-goer to do is to get a copy of Mr. Gilman's book and prepare himself beforehand."—*N. Y. Evening Post*.

"From Berlioz and Liszt and Raff and Wagner, down to the latest works of Strauss, D'Indy, Debussy, Sibelius, Rimsky-Korsakoff, Elgar, Chabrier, and Converse, with many others that will occur to concert-goers, Mr. Gilman has left nothing that has any claim to the attention of music-lovers. . . . It is a useful and interesting book."—*The New Music Review*.

"A valuable contribution to the music-lover's library."—*Chicago Post*.

The Vanishing Forests of America

Forty Billion feet of Lumber are Cut yearly in the United States, or three times as much as is grown in that period.

At this rate of consumption it is estimated by the Government's Forestry Service that the timber supply of the United States will be exhausted in from 20 to 33 years.

The facts of this alarming situation and the steps that are being taken to meet it are told in a deeply interesting article, illustrated with remarkable photographs, which will appear in the March 28th issue of HARPER'S WEEKLY. It will be on the news-stands next Wednesday, March 25th.

HARPER'S MAGAZINE FOR APRIL

Wall Street Under the Dutch

The first of a group of notable historical articles by FRANCIS THURGOOD HILL. In these papers Mr. Hill traces the history of New York's most famous street from its earliest beginning, when the street was literally a wall, or, more accurately, a wooden palisade, which was built as a protection and formed the northern barrier of the city.

A Notable American Painter

CHARLES H. CAPPIN contributes a delightful appreciation of the work of Thomas W. Dewing, one of the living American painters. Many of the paintings reproduced are from the famous collection of Charles L. Freer, of Detroit, and will form a part of his recent munificent bequest to the United States government, for which he is to build a gallery in Washington. Some of the most striking of Mr. Dewing's pictures are reproduced in tint.

The Passing of the Alligator

Mr. A. W. DUNCK writes of the rapidly disappearing Florida alligator, and makes a plea for his preservation. His article is illustrated with remarkable photographs, which show the alligator is not as bad as he is painted.

The Man Machine and How It Works

Dr. EDWARD AVERES writes most clearly and scientifically of the marvellous mechanism of the human machine. By drawing comparison with the most elaborate inventions of man, he makes plain the wonderful workings of our minds and bodies, and shows how far man, as a mechanism, is beyond all human creations.

The Church at Ararat

H. W. NEVINSON writes of his visit to the ancient monastery at Mt. Ararat, sixteen centuries old, where the Armenian monks cherish many quaint and valuable relics and ancient texts. Mr. NEVINSON describes also the Persian cities which Noah is said to have founded.

The French Element in English Speech

Prof. LOUNGBERRY writes of the elements of French which has crept into the English language, both early and late, and of the attitude of writers of various periods towards these intruders. Prof. LOUNGBERRY's own attitude is an eminently sane one.

The Courtyards of Paris

VANCE THOMPSON, the writer, and Vernon Howe Bailey, the artist, recently made a wandering trip through the streets of old Paris. Mr. THOMPSON writes most delightfully of the many famous courts with in the busy life of the city, where in bygone days famous men and women have lived—an article full of romance and charm. Mr. Bailey has illustrated the article profusely.

7 UNUSUAL SHORT STORIES

These are stories of humor, incident, character, romance—stories of all types and each the best of its type.

JUNIOR MILES FORMAN contributes an uncommonly strong tale of a man who argues that he has no right to risk his useful life to save a worthless one, of his experience and what comes of it—a love-story of city life and a strong study of character.

HARRIET PRESCOTT SPOFFORD writes of her country folk, a story of humor and unusual situations.

MARGARET BOWEN, a young English writer, whose work has attracted much attention, gives us a tale of early Saxon days in England, and of the love of Valerian of Ravenna (one of St. Augustine's companions) for a Saxon princess. There are pictures in color by Howard Fyke.

MIRIAM CAMPBELL DYER's story, "The Mother-Bird," is one of the strongest short stories which HARPER'S has ever printed—a story of a young girl working for her family, and of the supreme sacrifice which she makes that they may have comfort and health.

NORMAN DUNCAN, always among our best story writers, tells a tale, half humorous, half serious, of a quaint old character and his faithful and life-long saving for a pathetically curious purpose.

MARY AUSTIN's story has in it the element of the supernatural, handled with mastery skill.

MARGARET SUTTON BRIDGEMAN contributes a peculiarly interesting story which presents a study of the characters of a young girl and her father.

HENRY JAMES's two-part novella, "Julia Bride," is enclosed.

Mrs. Humphry Ward's Great Serial, "The Testing of Diana Mallory"

COMMENT

Too Many Wild Tales

WHILE the President exposes himself pretty constantly to just criticism, and while various of his authentic deliverances make sober-thinking people anxious and retard the re-establishment of confidence in the business world, there are in circulation altogether too many wild stories about him, and they are received with altogether too much credulity. His friend Dr. ALBERT SHAW has thought it expedient to make public denial that Mr. ROOSEVELT has taken to drink—an absurd story. This is the season of the year when the brain-workers are particularly apt to be tired. We guess Mr. ROOSEVELT is tired, and for that reason he may be somewhat more impetuous than usual; Wall Street, which has been under an unusual strain since last October, is tired and exceptionally hysterical; the lawyers who have been trying to keep the railroads and banks out of receivers' hands, or to get them into them, are tired, and take very depressed views of the future; folks who cannot get money to pay their debts or carry on their business are tired and harassed. Altogether we are a pretty nervous community, and more hospitable to disquieting rumors, and more jarred by them, than we would be if we felt better. It seems, then, the part of reasonable prudence not to believe everything we hear from Washington. When Jones confides to us that Mr. HILL went to see the President, and that the President hit his head off; that he kicked Mr. MILLER downstairs and jumped up and down on the soft part of his stomach; that he threatened Mr. Somebody to call out "my troops" if the mal-factors did not be good; that he has committed his sacred honor to the keeping of Senator JOSEPHUS BONNE and will follow that person's judgment about conserving it—let us think several times before we believe any of these stories, or of the hundred others like them that float about, constantly renewed from day to day. The President has vast power, has done much mischief, and may do more, but it is better on all accounts to wait till he does it than to have daily fits and perish beforehand from fright at what probably won't happen. It is an excellent time to be sane. Civilization was retarded for ages by a belief in demons with awful powers and malevolent dispositions. It is time we outgrew that sort of handi-cap.

Hepburn Worries the Brokers

The Hepburn bill to stop speculation in stocks seems much too wild a proposition to lose any sleep over, nevertheless Wall Street has been anxious about it. It is Wall Street's business to be anxious, and it attends to it conscientiously. The bill provides for a Federal tax of fifty cents on every sale of every hundred-dollar share of stock. On the low price

shares this is an enormous tax—almost confiscatory. On almost all shares it is big enough to interfere with purchases not backed by very earnest intention to retain the property bought. How Wall Street feels about it is sufficiently indicated by the *Wall Street Journal*, when it says:

If President ROOSEVELT and Mr. Hepburn desire that the year 1908 shall witness another panic so tremendous in its sweep and devastating in its effects that the panic of 1907 would in comparison seem as merely a frolic of mischievous children, they have only to force Congress to pass the Hepburn bill taxing stock sales.

This would indeed destroy speculation, and also the entire system of American finance.

And again:

The Hepburn bill to tax stock sales fifty cents a share should be entitled:

"A bill providing for an easy transfer from the United States to England of a business worth hundreds of millions of dollars a year."

At this writing neither President ROOSEVELT nor Dr. BRYAN has made a public appearance as sponsor for the infant bill. We do not know yet whether either of them approves it. Wall Street seems to have taken it for granted that the President does. Maybe it has learned by solemn experience to expect the worst from the President. That at any rate is what it does expect. But, however the President or Dr. BRYAN may feel about the Hepburn bill, it does not seem to be truly dangerous. It is too foolish. Speaker CANNON's penetrating influences would be adverse to it in the House, and in the Senate there are too many men who know a little something for the bill to come anywhere near getting through, if it even so much as came to a vote. If any such measure ever should become a law, one effect that it would have while it continued in working order would be to transfer to London or possibly to Montreal the great business of making the market for stocks. That would be very inconvenient, and would put an effectual check upon the erection of office buildings below the City Hall Square in New York. To see the Battery become a residence quarter again would be interesting, but not worth the money it would cost.

True to Taft

We find our friend and neighbor the *Sun* saying on March 4:

We must unequivocally decline to consider Mr. TAFT as the candidate of the Republican party and must unreservedly accept Mr. ROOSEVELT as a claimant for the nomination. We now reluctantly join with those who reject his refusal of a third term as negligible and dubious and as meaning the reverse of what it says.

It is not so it rests with Mr. ROOSEVELT to determine the matter. It is very simple. All he need do is say "If I am nominated, I will not run. If I am elected, I will not serve."

And this Mr. ROOSEVELT must do promptly or the people will give fighting against him by default.

The *Sun* comes to this painful attitude towards Mr. ROOSEVELT because, it says, "his friends, adherents, and sympathizers, together with his army of officeholders," reject his renunciation and are using TAFT's candidacy as a blind, their real purpose being to re-elect ROOSEVELT. From minds in which this idea is firmly lodged nothing short of hari-kari that Mr. ROOSEVELT could do would have any effect to dislodge it. No disclaimer could add anything to those he has already filed, so there is no sense in his putting out another. We find the same idea expressed by the *Sun* expounded piteously by the gifted ORIN, in Mr. HEARN'S *American* newspaper, and this, together with other tokens of blundered sentiments, inspires some of the newspaper contemporaries to speculation about a possible community of interest—or at least of ideas and purposes—between the *Sun* and Mr. HEARN. For our part we have no doubt at all that the President is entirely sincere in his support of Mr. TAFT, and will do his utmost to have him nominated, and then to elect him. There is plenty to be said in criticism of the President's desire to name his successor, and of the means he takes to realize it, but the notion that he is not sincere in his support of TAFT is rubbish.

Gems from Nebraska

"Predatory wealth" and "powerful interests" are again the objects of attack in the BRYAN platform that comes from Nebraska. One would suppose that so practiced a candidate as BRYAN and one so glib of tongue would find some new catchwords for this, his 4th candidacy. But the language is

the same Populist jargon, now diluted and denatured by Republican plagiarism. Once again the name of JEFFERSON is taken in vain (JEFFERSON, what crimes, etc.), and the name of the apostle of States' rights is used to conjure with by a man who would so centralize government as to destroy every large corporation in any State. Again we see the same frayed notions, the same wild ideas about public finance, which of all governmental work is the hardest to make plain to the popular mind. Railway transportation rates are to be so reduced that "they will yield only a reasonable return on the present value of the roads, such reasonable return being defined as a return sufficient to keep the stock of the roads at par when such roads are honestly capitalized." Thus, as the *New York World* points out, if 4½ per cent. dividends were sufficient to hold stock at par, no railroad would ever be permitted to turn more. Increased profits by dint of economical management or attraction of heavier business would be instantly confiscated by the government. The stockholders would receive 4½ per cent. in times of prosperity and nothing at other times. Naturally, all the world would madly rush to purchase stock offering such splendid investment opportunities. Thus we see our old friend 16 to 1 is not an isolated phenomenon, but really part of an economic system fearfully and wonderfully made.

Citing the Rules Against Dr. Day

THE REV. GEORGE A. COOKE, a Methodist minister of Brandon, Vermont, who seems to make a specialty of overhauling his reverend brethren, has preferred charges against Chauncey DAY of Syracuse for violation of the rule of the Methodist Church which forbids speaking evil of magistrates. The chief specification in Dr. DAY's case is that in a book called *The Road on Prosperity* he spoke contrary to rule about President ROOSEVELT. Maybe he did, but if so, and if he is disfigured for so doing, where will it leave the reverend politicians of the Methodist Church? The Methodists are probably more active as Methodists in politics than the members of any religious body in the country, and their ministers participate pretty freely along with the rest. Is it to be the rule for them that they may praise and support all the officeholders, but must not assail any of them? It would seem that if the rules allow them to be active in politics at all, they should allow them to hold forth as bravely on one side as on the other. The President and his policies are now the centre of political dispute. The Methodist rules should not nag the critics of the Chief Magistrate unless also they nag his supporters. Mr. COOKE, who is after Dr. DAY, has made charges within five years against five distinguished Methodist divines. In our case his charges were sustained. In four cases they were dismissed.

Mr. Bryan and Mr. Bennett

In view of the probability of Mr. BRYAN's third nomination as the Democratic candidate for President, it is but natural that episodes indicating the quality of his personal character should evoke interest. His eager effort to increase the revenue of his paper by urging his personal adherents to organize big subscription clubs, ostensibly for general political or public purposes, we are disposed to dismiss as a mere example of poor taste rather than to pronounce it a sign of mercenary inclination. We should be glad to be able to feel that the like might be said of his financial relationship with the late Mr. BENNETT, the account of which is presented in another column. Candor, however, compels the admission that analysis forbids such a deduction. Obviously Mr. BENNETT was a sincere devotee, whatever may have been the recent ambition in his heart. It may be the fact, too, that Mr. BRYAN felt justified, for the sake of a cause, in accepting money from a comparative stranger, at intervals, for a period of years, for his personal use, without pretending to render any return in value. But the way in which it was done—the surreptitious making of the will at Mr. BRYAN's house—the careful copying of the same by Mr. BENNETT in New York—the secrecy enjoined upon Mrs. BENNETT—all apparently under the direction of Mr. BRYAN—seem to fail to make an impression of disingenuousness and the sly exercise of hypnotic influence most disagreeable to contemplate as possible by a man whom millions wish to become a candidate for President of the United States. Mr. BRYAN, whom we have been accus-

ed to regard as honest, though ignorant and misguided, owes it to himself and to his followers to make a more definite statement regarding this transaction than has yet come from his pen or even his tongue.

Reasonable Regulation for Vivisection

The race-track people are trying to provide that their industry, with its necessary incidents, shall be so conducted as to be less objectionable to moralists. The brewers and liquor dealers all over the country, where they are still allowed to do business at all, are exerting themselves to secure denial of licenses to improperly conducted saloons. And the railroads are trying very hard to be good enough to avoid extermination, and the stockholders and the trusts have got their heads together over the problem of saving the said heads from being taken off. May we not give to the learned vivisectionists the friendly counsel to try to take a leaf out of the books of all these other harried interests, and instead of opposing all legislation in restriction of surgical experiments on live animals, exert themselves to get a law on the statute book which will regulate vivisection by such reasonable limitations and precautions that the repose of the less fanatical of the anti-vivisectionists may not be marred by dreams of tortured animals? Vivisection, in our opinion, ought by no means to be subjected to sweeping prohibition. Nevertheless here and in Europe there have been past abuses of it, which are matters of authentic record, that have been horribly cruel, and the records have been made and published by men apparently of decent standing in the surgical profession. We have faith to believe that no such abuses would be tolerated in any institution conducted by responsible medical men in this State, nevertheless the utmost assurance that can be given by law against such cruelties is well worth giving. Otherwise there is danger that this whole line of experimentation will be declared unlawful, and prohibited by penalties that it will be more than embarrassing to incur.

Not British Citizens

Since our republic set up for itself there never has been until very recently an emigration of Americans from the United States that was worth noticing. Some of our women have married Europeans and become subjects of kings, but until lately exceedingly few United States voters have ever given up their citizenship. Within ten years, however, a good many thousand of our North-westerners have gone over the border into the Saskatchewan country and taken up wheat lands, and these emigrants from Uncle Sam's domain have usually, as part of the process of getting their land, taken out papers to be Canadian voters. This involves finally swearing allegiance to King EDWARD, so that these adventurers give up their citizenship in the United States. And what do they get in return? Almost all of them suppose that they become British citizens, with all the rights as well as obligations of that condition. But it seems not. We learn from the *Winnipeg Telegram* that they become merely citizens of Canada, with a right to vote and hold office in the domain governed from Ottawa, but that as soon as they go outside of it they become citizens of no country. By British law, it seems, a naturalized Canadian is not a British citizen. He cannot take out naturalization papers in England until he has lived there five years. "Not a single British colony," says the *Winnipeg Telegram*, "has, as the law stands to-day, the slightest power to grant to an alien rights of British citizenship that can be enforced outside of its own boundaries. . . . There is not the slightest doubt about the law." It seems, then, that our Porto-Ricans have plenty of company in their condition of being folk without a country when they go away from home.

A Splendid Piece of Work

It was a great help to the spirits to have it announced that the Knickerbocker Trust Company would resume business. The resumption was made possible only by a long, hard, persistent struggle, led for seventeen weeks by Mr. SATTLEBAX's indefatigable committee, and helped by as many good men as could find places on the wheel to put their shoulders to. To reopen these doors was a job worth doing, and it was splendidly done. Its direct fiscal effect is important, still more so its moral and indirect effect. Well done, gentlemen! You have made us all your debtors!

The Great Powers: Which Are They, and for How Long?

It is a commonplace that empires are more of a game than the players, and, therefore, it is worth while to note the report made to his government by the representative of China, which at The Hague was relegated to the status of a small Power, while the eight great Powers took and held the front of the stage throughout the second peace conference. It is unquestionably true that, as China's delegate tells his government, while all of the forty-five nations represented at The Hague were theoretically equal, a sharp distinction was made, and enforced in practice, between eight nations regarded as great and the remaining thirty-seven, inferentially proclaimed to be small. What concerns us at this time is the justice of the Chinese Minister's refusal to accept as permanent any classification of Powers into great and small. He points out that greatness depends upon the efficiency of a country's governmental system, upon her methods of law, and upon her military and naval preparations; we may add, upon her population, her industrial and her financial resources. History abounds in conclusive and interesting proofs of this assertion. The examples prove that population and even wealth, though important factors, may be of less temporary weight than preparation and efficiency. We do not need to go back more than four or five centuries to show the truth of this assertion. In the middle of the fifteenth century there were only three Christian Powers in Europe which had any sound pretensions to be described as great. These, of course, were the Holy Roman Empire, France, and England. Spain had not yet been unified by the marriage of FERDINAND of Aragon to ISABELLA of Castile; Italy was a chaos; Poland was paralyzed by the liberum veto which enabled a single member of the Diet to defeat the will of all the rest; Sweden had not yet been risen by GUSTAVUS VASA to a position of independence; the elector of Brandenburg had not yet crowned himself King of Prussia. By 1560, on the other hand, the number of Christian Powers universally recognized as great had increased to four, Spain not only having demonstrated her right to be included in the circle, but being generally reputed the most powerful state in Europe. That supposition lasted for a century, long after all real ground for it had vanished.

If, now, we turn to the middle of the seventeenth century, to the congresses and treaties which historians term collectively the Peace of Westphalia (1648), we find a new state, Sweden, admitted to the rank of great Powers, a rank to which she had no claim on the score of population and wealth, but which she had earned by the surpassing genius of GUSTAVUS ADOLPHUS, and by a military efficiency and prestige which survived him for many years. It is notable, however, that at this time Poland was not regarded as a great Power by the nations of western Europe, although less than forty years later the Polish king, JOHN SOBIESKI, was to rescue Vienna from an Ottoman army. At this time, too, and for some two centuries afterwards, religious prejudice excluded from a European conference the Turkish Empire, which, on the score of military and naval resources, undoubtedly deserved recognition until her fleet was destroyed in 1828 at the battle of Navarino, and until about the same time a Russian army under General DIMITRIY crossed the Balkans, took Adrianople, and threatened Constantinople. Meanwhile, an extraordinary change in the adjustment of Powers had taken place in Christian Europe. After the Seven Years' War, a European Congress which should have left out the Prussia of FREDERICK the Great or the Russia of CATHERINE II. would have been ridiculous. Both of those great nations were growths of the first half of the eighteenth century. Thenceforth, in the august circle of great Powers, Prussia and Russia took places which were never to be challenged. On the other hand, by the close of the first decade of the eighteenth century, Spain, which, for a time, had been preeminent, lost her claim to figure among first-class Powers. At the Congress of Vienna (1814-15), the great Powers were Russia, Prussia, Austria, France, and Great Britain. The same Powers assumed the duty of regulating the affairs of Europe in the Congress of Paris (1856), although in that gathering Turkey appeared in the guise of a petitioner, and, against the protest of Austria, Sardinia was admitted in a consultative capacity. For the next authoritative alignment we must go to the Congress of Berlin, which took place in 1878. Here, again, Turkey appears, not, however, as a judge clothed with equal authority, but rather as a victim protesting against executive manipulations. What renders this Congress remarkable is that it was the first imposing international recognition of the fact that unified Italy deserved to be classed as a first-rate Power. Otherwise there was no change in the signatories, which, as in the Congress of Vienna, included Russia, Austria, Prussia (now expanded into the German Empire), France, and Great Britain.

The six great Powers are now expanded into eight, the additions being the United States and Japan. It is interesting to recall the circumstances under which they secured a tardy recognition. It was by our successful termination of the great War of the Rebellion that we proved impressively and decisively our right to be counted among the world's great Powers. The fact is often over-

looked that in the spring of 1865, when, as yet, the conscription system had not been generally applied on the European Continent, we could have coped with the whole of Europe in arms upon the land, for we had at our disposal upwards of a million veterans. Another fact is frequently lost sight of, namely, that at the same conjuncture we had more iron warships than all of the rest of the world put together, for the European fleets still consisted mainly of wooden vessels. Some years elapsed before our naval superiority was lost, here we perceive the fundamental reason for England's concluding the Treaty of Washington, which provided for submitting the Albatross claims to arbitration. Yet, although our right to take part in conferences of great Powers dealing with questions of world-wide interest would not have been challenged had it been asserted in 1905, it was not formally recognized until we were invited to attend the Berlin conference, which resulted in the creation of the Independent Congo States. We have, of course, no interest in the west coast of Africa, except indirectly, as exercising a certain tutelary function with regard to the republic of Liberia. Neither have we any interest in Morocco; nevertheless, we were invited, and we accepted the invitation, to take part in the Algeiras conference. No nation would now dream of calling a congress for the purpose of arranging the affairs of eastern Asia without requesting the United States to participate. In both of the peace conferences held at The Hague a place of dignity and influence second to that of no other nation has been accorded to our country. This recognition of our importance in international councils is doubtless due in large measure to the widespread knowledge of the fact that our population is nearing the hundred million mark, and that our wealth, as attested by a British statistician, already exceeds that of the British Empire, and is increasing with an ever rapidly. On the score of military preparations, we should deserve no such rank, but as regards our navy we are, for the moment, the second Power upon the globe.

No longer ago than 1865 the suggestion that Japan would ever be admitted to the circle of great Powers would have been dismissed as incredible and absurd. After her successful war, however, with China in 1894-5, it became indisputable that she must be treated with considerable respect, and she was invited to participate in the first peace conference at The Hague, although not yet was she invested with the prestige of a first-class Power. Then came the war with Russia, in which Japan defeated a nation reputed to be stronger on land than any other in the world. The result was that in the second peace conference Japan was acknowledged, officially and unreservedly, as one of the eight great Powers. This, particularly, is the lesson which the Chinese delegates to the Hague conference would have his fellow subjects take to heart. If so much could be accomplished within half a century by Japan, whose population falls short of fifty millions, and whose natural resources are relatively inconsiderable, what ought to be achieved within a similar breadth of time by the Celestial Empire, which has between three and four hundred million inhabitants, and which, as regards the deposits of coal and iron, is the richest country on the globe? The honor of being at least the ninth among the great world Powers is that to which China's spokesmen at the second peace conference would have his countrymen look forward.

The Failure of Success

"I AM wrestling with a new subject," wrote Ingers in 1866, when he was beginning *Peer Gynt*. "But I know I shall get the upper hand of the brute before long." He did get the upper hand, although *Peer Gynt* was far from winning a quick success, and as his works follow the same line, he realized how systematically and increasingly he mastered brute matter and shaped it into art forms. Nowadays success brings swift returns, but the result of quick successes is something very closely resembling failure. It took very nearly forty years for *Peer Gynt* to run into a tenth edition; it would be difficult now to come at an accurate counting of the editions and translations of the great poem. Not only so, but we know that as the years pass there will be more and more editions of the play and its fellows, more and more translations and productions.

Nowadays we are, however, constantly confronted with the anomaly of a really fine piece of work followed by dwindling and anemic successors from the same pen. A fine novel seems the probable forerunner of two or three weak and empty performances from the successful author. There are many reasons possible to assign for the misfortune: first of all the root of all evil is sending up its shoots here as elsewhere. Authors love money as well as other men. A successful book means tempting from the publishers who use successful authors as a means to money-making themselves and who, under dominion of the same evil spirit, usually urge swift production. Production, however, lays down its own laws, and these laws are as little concerned with money-making as the laws of nature. An author who has been long rejected and overlooked is likely to gird up his loins, gather up all his forces, and put together in his book all that struggle and disappointment,

deprivation and isolation have taught him all the garner of thought and emotion of silent hours, and the result is a worthy look. When, however, the applause grows loud, and he is coaxed and bribed into doing more of the same thing immediately, he has no stored material to draw upon. If he succumb to temptation—as, alas! being human, he usually does—he can but offer a weak imitation of his former achievement, or such slight effusions as have belonged heretofore to rejected matter.

If any man were eloquent enough to persuade authors to love art more and money less, to be content after a masterpiece to let his mind lie fallow until once more, of its own accord, a compelling subject springs up, and by rare and arduous and watchfulness, the setting, the data, the decoration accrue into it, he would do that greatest service to art that can be done. Even to such great writers as M. MARCELINEK, the kind and good Mr. HENCKES, and the brilliant Mr. HICKS, one would like to send a round robin petition begging for two years' silence and then a worthy product.

When one remembers, too, the rejected rounds of most great works, one would like, too, to urge upon all readers and critics the indubitable truth that a look is great by virtue not of the evil that is left out of it, but by the vitality that is put into it. SHAKESPEARE'S masterpieces are not flawless, but they live by the power of their fulness of being, the effort, the concentration, the wealth of observation, the characterization, the human situations; these make any one of the great plays an invaluable and lasting document. But the divine afflatus cannot be beckoned down every day, and a writer who has once done a fine book should consecrate himself thereafter to the production of greater and greater work. Only thus, only by turning away the face from debilitating praise and concentrating the whole strength upon the unwon heights, shall we have a new race of giants in the realm of literature.

The Late Edward Henry Strobel

By Henry L. Nelson

THERE died the other day at Bangkok, the capital of Siam, one of the most heroic figures of our time, a great hero of peace, an American so little known that even his native city of Charleston was almost unconscious of his existence, and quite unaware of the honor which he was adding to the lustre of his country.

EDWARD STROBEL was one of the foremost and one of the most useful diplomats of his time. It is one of the misnomers of the country that, useful and able as he was, his diplomatic service to the United States was of short duration, for the singular reason that he was a Democrat. Party spirit, or prejudice, or greed, whichever you will, deprived the country of STROBEL'S services—services of a character that placed them wholly outside the narrow confines of party policy. STROBEL'S career was great, and those who knew of it and who were happy enough to know him, are conscious of its greatness. He was graduated at Harvard in 1877, and from the law school in 1882. In the campaign of 1884 he attracted Mr. CLEVELAND'S attention by a pamphlet, published without his name, entitled, "Mr. BLAINE and his Foreign Policy." It introduced STROBEL to his diplomatic career, for Mr. CLEVELAND sent him to Madrid as Secretary of Legation, J. L. M. CLEVELAND being minister. STROBEL was there with Mr. CLEVELAND and afterwards, with Mr. BELMONT, and much of the time he was in charge of the legation, doing some especially noteworthy work in Morocco. Mr. HARRISON became President, and Mr. BLAINE Secretary of State, and STROBEL was retained for a year in order that he might conduct the Moroccan business. Then, nothing existing being in progress, STROBEL was dismissed to make way for a Republican.

When CLEVELAND came in a second time, STROBEL served for a time as third Assistant Secretary of State, but thought that his experience and his achievements might warrant his appointment as minister of a Latin American power. After a time the opportunity occurred, and he was sent to Ecuador, and afterwards promoted to Chile. While he was at this post, he was really the foremost among the corps of diplomats. Chile established the single gold standard in 1903, and STROBEL'S admirable report on the movement and its result was of great assistance to our own effort in the same direction. Then CLEVELAND went out of office, and the solemn needs of the Republican party required, once more, that the country should no longer have the service of EDWARD STROBEL. It was never again to be his fortune to have that splendid service. Chile wished him to remain, and a petition was started, directed to Mr. McKINLEY, asking, on behalf of the Chileans, for STROBEL'S retention. STROBEL succeeded in preventing this manifestation of affectionate respect and, perhaps, of bad taste. It would have been singularly inappropriate if STROBEL had been thus proclaimed to the world, for he spent a good deal of his life in avoiding publicity. Chile and France both, neither knowing of the other's action, desired him to be an arbitrator between them, and, for a time, he was counsel for Chile before a claims commission at Washington.

In 1898 he became professor of international law in the Harvard Law School and there continued until 1903, when he got two years' leave of absence to go to Siam as General Adviser to the government of that country. He followed an Englishman, who died at his post, and now we reach the tale of heroism, of beautiful devotion to duty, and of sacrifice. After two years at Bangkok, STROBEL started to come home for a vacation. He had reached Egypt, when he was stricken by a pneumonia bug; for many weeks he lay in a hospital expecting death; at last he was taken to Paris, and there specialists experimented with him and kept him alive. The poison had made its destructive way to every part of his body. Its visible signs appearing now in one spot and now in another. One day he learned that one of the French specialists was coming to this country to attend the medical congress, and he asked that he might be brought with him. He was put into a plaster cast and brought here; for months he was under the care of specialists, now appearing to improve and then sinking, suffering greatly always. In the summer he was taken to Cambridge, and there, sitting and sustained by an iron frame, he received the Doctorate of Laws from the university. Months passed and he remained in this country until the winter, when, still suffering, he returned to Bangkok because he had work to do and he wished to do it before he died. At last, propped up in his bed, tortured with pain, which he bore smilingly and even humorously, he finished his task—the great task of reconciling the differences between Siam and France; and, that over, he died good-bye to the world that loved him and admired him, and he died.

Personal and Pertinent

FEW British writers have ever received from America a more interesting book notice than befell the other day when (according to the Boston Transcript) President ROOSEVELT, ELIOT ROOT, and HENRY CAROT LORCE sent overseas a silver cup bearing the inscription, "Sir GEORGE TRAVELL, historian of the American Revolution," with their signatures engraved beneath.

REINHOLD FROST was one of the most practical of United States Senators. His training in the Civil War gave him an insight into military affairs, and being also interested in the Department of Agriculture, he often took charge of the army and agricultural appropriation bills. His gifts consisted mainly in common sense and capacity for work, but they were substantial gifts, and because of them, and because of the confidence that his character inspired, he was always an influential Senator. It so happened that he had much to do with shaping the American attitude toward Spain immediately before our war with that country. On a visit to Cuba the Senator had the opportunity of seeing the camps of the concentration, and was deeply stirred by what he saw. In a speech made after his return he described with moving simplicity the wretchedness and suffering of the starving concentration. The speech was purely descriptive and wholly unbiased, but as it was delivered about midway between the blowing up of the Maine and the declaration of war, it had a profound influence on popular opinion, and though doubtless nothing was farther from Senator FROST'S mind than the desire to bring on war, he did help to bring it on. This calls to mind the dictum of Professor BLACKIE of Edinburgh to his students, that any one of them, even the gentlest, had that in him that could raise a revolution.

At last according to Colonel WATSON was still absorbing ocean and warring summer clothes at Naples-on-the-Gulf, Florida. He continues to give frequent evidence in the *Courier Journal* of being in remarkable health and spirits. The editorial page of the *Courier Journal* is of an old-fashioned size, but the evergreen colonial garlands up and down its long columns with all the energy of youth and a thousand times its knowledge. He has been reading SCHREYER'S *Memoirs*, and talks nearly three delightful columns about him. He says of Mr. SCHREYER: "He was a German. He was an artist. By nature a doctrinaire, he had become a philosopher. He could never wholly adjust himself to his environment. He lectured LUTWEL and LUTWEL, perceiving his earnest truthfulness and genuine qualities, forgive him his impetuosity, nor ceased to regard him with the enduring affection one might have for an ardent, aspiring, and invincible boy. He was repellent to GALT, who could not, and perhaps did not, desire to understand him. To him the Southerners were always the red-faced, smash-mouthed slave-drivers he had fancied and pictured them in the days of his abolition oratory. More and more he lived in a rut of his own high and noble fancies, wise in books and councils, affectionate in his relations with the few who enjoyed his confidence; to the last a most captivating personality. Though fastidious, SCHREYER was not intolerant. But he was very hard to convince—tenacious of his opinions—very cautious, but very insistent in debate. He was a German; a German *Tier* Doctor; of name, no letters, and of common law. During an interview of more than thirty years, we scarcely ever agreed about any public matter, differing even about the civil service and the tariff; but I admired him hugely and loved him heartily."

Correspondence

THE STRANGE CASE OF MR. BRYAN AND MR. BENNETT

MASSACHUSETTS, WASH., February 11, April

To the Editor of *Harper's Weekly*:

Sir,—I have heard it stated that the conduct of Mr. W. J. Bryan in the Bennett will case proves him to be avaricious to the point of disgusting many of his admirers. Time has obscured my memory on this point, and I hope the editor will kindly present the facts of the matter.

I am, sir,

A. W. PIERSON.

When William Jennings Bryan was making his whirlwind campaign for the Presidency in the Atlantic coast States he won the enthusiastic admiration of Philo S. Bennett, an elderly citizen of New Haven, Connecticut, who had amassed a comfortable little fortune as a wholesale dealer in beans, coffee, and spices in New York, and who presently determined to devote a large share of his property to the support of Mr. Bryan and the dissemination of the Bryanite doctrines.

The first meeting of the two men was described by Mr. Bryan when he testified before the Probate Court at New Haven, on October 21, 1903. He volunteered the following statement:

"My first acquaintance with Mr. Bennett was in the campaign of 1900, when he was one of the electors on our ticket in this State, and he was on the train from New York to New Haven, and, as he reminds me in this letter which I shall read, rode in the carriage from the station to the hotel. The next time I had my attention called to him was after the election, when I received a letter which was written before the election. The first letter I received from Mr. Bennett was dated at New York, October 30, 1900."

Mr. Bryan read the letter, which was put in evidence. In it Mr. Bennett wrote:

"DEAR SIR:—The letting is three to one against you in this State at the present time; but notwithstanding I am impressed with a feeling that you will win, and if you are defeated I wish to make you a gift of \$30,000, and if you will accept the same, it will be a genuine pleasure to me to hand it to you any time after the tenth of next March."

"Sincerely yours,

"P. S. BENNETT."

Mr. Bryan testified:

"He followed out his suggestion there, and sent me a check in March of each of the following years, making \$30,000. Early in 1901 when I visited New York he met me as he always did. At that time he gave me \$300."

During the three years and a half that elapsed between the first meeting of Mr. Bryan and Mr. Bennett the friendship between the men was constantly growing, and reached its climax a few weeks before the beginning of Mr. Bryan's second campaign. It was then that Mr. Bennett made his last will and testament, in which was a bequest of \$50,000 to Mrs. Bennett to be disposed of according to the directions she should find in a sealed letter enclosed in the same safe deposit box with the will. This letter, signed by Mr. Bennett, instructed the widow to give the \$50,000 to Mr. Bryan in secret.

Bennett visited Bryan's home for two days at Lincoln, Nebraska. Bryan drew the will. Mrs. Bryan did the typewriting. Bennett then returned to New York and executed the will and copied and signed the letters drawn up for him in Nebraska by Bryan.

Philo S. Bennett was killed in a runaway in the summer of 1902. Not long afterward his last will was presented for probate in the Probate Court at New Haven. By its terms \$75,000 was bequeathed upon three legacies: Bennett, the testator's widow, together with three known (mortgaged) in Bridgeport, Connecticut, also all paintings, pictures, furniture, jewelry, heirlooms, etc., also one-half of the residuary estate. The sum of \$75,000 was divided to various relatives, and \$2,500 to churches, hospitals, etc. Mr. Bennett bequeathed \$25,000 to Mr. Bryan in trust, to be divided among twenty-five colleges and universities to give prizes for essays discussing the principles of free government, and to help poor and deserving boys to get an education. To Mrs. Mary Baird Bryan, Mr. Bryan's wife, \$10,000 was devised in trust to help poor girls to get an education. Mr. Bennett also left \$5,000 to the New Haven Public Library and \$10,000 to erect the Bennett drinking fountain at the southeast corner of New Haven green.

The twelfth clause of the will was as follows:

"I give and bequeath unto my wife, Grace Ingeborg Bennett, the sum of \$50,000, in trust, however, for the purposes set forth in a sealed letter which will be found with this will."

Mr. Bennett appointed Alfred P. Sisson, his partner in business, and William Jennings Bryan, executor of the will, which was executed in New York, on May 22, 1900. With the will Mr. Bryan presented the letter above referred to. It was in an envelope marked:

"Mrs. P. S. Bennett.—To be read only by Mrs. Bennett and by her alone, after my death."

P. S. BENNETT."

In this letter Mr. Bennett urged his wife to give the \$50,000 to Mr. Bryan because: "I consider it a duty, as I find it a pleasure, to make this provision for his financial aid, so that he may be more free to devote himself to his chosen field of labor."

With this letter was one, referred to by the court as "the typewritten document," which Mr. Bryan drew up in Nebraska, and gave to Mr. Bennett, who took it back to New York, copied it, and sent it to Mr. Bryan as original. It was:

"NEW YORK, 5/22/1900."

"MY DEAR MR. BRYAN:

"I inclose a duplicate letter, which I have placed in a sealed envelope, with instructions that it shall be opened by Mrs. Bennett, and read by her alone. I have stated therein the reasons for the provisions made for you, and I sincerely hope you will accept the sum of fifty thousand dollars for yourself. Give ten thousand dollars to your wife, and invest fifteen thousand dollars for the benefit of your three children, giving five thousand to each, whenever you think it wise to turn the money over to them."

"If for any reason you decline to receive the entire sum, or any part thereof, I shall trust you to distribute the same according to your judgment among educational and charitable institutions."

"Sincerely yours,

"PHILO S. BENNETT."

The Probate Court admitted the will itself to probate, but added: "It is considered, altogether, and derived by this court, that neither said envelope nor letter, nor said typewritten document, nor said envelope, letter, and typewritten document taken together, be approved or allowed as a part of said will, and that the probate of said envelope, letter, and typewritten document, and each of same, be refused."

The Superior Court and the Supreme Court of Errors affirmed the judgment on appeal.—EDITOR.

DETAILS OF THE TOBACCO WAR

HARPER'S WEEKLY has received a number of letters calling attention to inaccuracies in an article entitled "A K-K-Klan of To-day," by Charles V. Teris, which appeared in the issue for February 8. One of these letters is as follows:

ATLANTA, GA., February 11, April

To the Editor of *Harper's Weekly*:

Sir,—In the issue of your magazine for February 8, in an article entitled "A K-K-Klan of To-day," by Charles V. Teris, there are a number of inaccuracies. This would hardly be worthy of notice had this article appeared in a magazine of no consequence, but a long and most pleasant acquaintance with the WEEKLY has given me the feeling that everything appearing therein is always correct, and it is for this reason that I desire to call the matter to your attention.

First, a half-page illustration has under it that the *Acme Flour Mills* have been largely of late legends of tobacco? Isn't that unusually curious for HARPER'S?

Then your contributor writes that the torch was applied to several freight cars at Princeton, while as a matter of fact three factories were totally destroyed, and possibly more.

Again, he quotes, "The trouble is confined to a few Western counties that raise the greatest Burley crops." Now while it is true that the burnings have until recently been confined to the western part of the State, it has been entirely in the Dark Tobacco District, or Black Patch, where no Burley is grown, and any one who knew as little about tobacco as that was not competent to give an opinion on the subject worth printing.

Also that dramatic fight so vividly pictured as occurring on the streets of Hopkinsville, originated in some one's fertile brain, for I have been told by several spectators that the Raiders before leaving the place called a roll of their men, after the work of destruction was complete, and that it was some thirty minutes before a pursuit was organized, and that it was several miles from Hopkinstown that a party of them was overtaken and shots exchanged.

Little details like giving Governor Wilson a middle initial of A. instead of his own, which is E., and spelling his name sometimes with an "I" and then with two, which is correct, are not worth noticing.

It seems strange that a resident of Atlanta should presume to criticize an article written about Kentucky, but I have very recently moved here from the heart of the affected district of the tobacco troubles and have had conversations with spectators of all the raids, and I am only writing you this letter because I believe either you or Mr. Teris has been greatly imposed on, for, as you have probably observed, writing is not in my line.

With kindest regards and wishes for the long continued success of your very interesting and entertaining publication,

I am, sir,

H. W. YOUNG.

Undoubtedly some of the statements in the article were at variance with those made by our correspondents. The fact that Mr. Teris, the writer of the article, was a member of the staff of the *Cincinnati Enquirer*, and conversant with the daily details of the tobacco war in nearly all counties in Kentucky, seemed to warrant the WEEKLY in having confidence in his knowledge of the facts and ability to reveal them. We regret the apparent errors in his story, and in giving permission to reprint the piece have sent to it that the errors now corrected be kept in mind. The error in the case of the picture of the "Acme Flour Mills and Elevator Company," which had a daily capacity of 1200 bushels of tobacco, which Mr. Young refers to, and to accurately it was due to the fact that the photograph sent to us for reproduction was marked incorrectly.—EDITOR.

Fighting the Fire at its Height, after the Building had become a Funeral Pyre

The Bodies of the Victims of Collinwood's Tragedy laid out in the temporary Morgue

Removing the Dead from the blocked Entrance at the Rear, where most of the Fatalities occurred

The Ruins of Collinwood's Fire-trap School-house where almost Two Hundred Children lost their lives

Relatives of the young Victims of the Disaster awaiting the removal of the Bodies

THE TRAGEDY OF A CLOSED DOOR

BETWEEN 100 AND 150 CHILDREN, AND TWO OF THE TEACHERS, LOST THEIR LIVES IN A FIRE WHICH SWIFT THROUGH THE LANE VIEW SCHOOL IN COLLINWOOD, OHIO, A NIGHT OF MARCH 4. THE FLAMES, STARTING IN THE BASEMENT, SPREAD THROUGH THE BUILDING WITH APPALLING RAPIDITY. THE CHILDREN, PINNED IN THE NARROW HALLWAYS AND AT THE FOOT OF A STAIRWAY LEADING TO A DOOR WHICH IN SAID EITHER HAVE BEEN LOCKED OR TO HAVE OPENED INWARD, WERE TRAMPLED, SUFFOCATED, OR BURNED TO DEATH. THE SCHOOL BUILDING, A THREE-STORY BRICK STRUCTURE, WAS COMPLETELY GUTTED

Wanted: Soldiers

AN AMERICAN ARMY PROBLEM

By VICTOR ROUSSEAU

HAT shuttlecock of political and philanthropic battles, the army, is going to be taken seriously!

Heretofore the army has been in the position of the snail which five-and-twenty fathoms tried to catch in vain. There are at least five-and-twenty questions which are being fought out intermittently over it. There is the question whether officers in the higher ranks shall be promoted by seniority or by favor. There is the question whether the cadets shall be restored, or whether it is preferable, as the W. C. T. U. maintains, that every army post shall be encircled with drinking dens, as now. These battles have been fought over these problems; and in the midst of it all the army itself, whose practical warfare nobody had very much time to think about, has been steadily dwindling. So many theorists have tacked their colors to the mast that it has split.

The army is now nearly twenty per cent. below its numerical establishment; and this deficiency exists in almost all branches except the cavalry. Desertions have depleted its ranks. Its members are now drawn chiefly from the least efficacious class of citizens, men who find in it a last refuge from the highroad and the construction gang; and of these a wholly disproportionate amount are not citizens at all. Although commissions can be obtained with comparative ease by educated men among the rank and file it has become difficult to procure even the normal complement of officers; for the army offers no prospects comparable with those held out in other forms of employment.

So, while the warring factions at Washington continue to reform their theoretical army, the government is making an attempt to bring its depleted numbers up to the established strength and to improve the personnel by appealing to a better class of recruit. With these ends in view a bill is being introduced at Washington to increase the remuneration of all men by an amount which averages about twenty-seven per cent.

Meanwhile strong efforts are being made to obtain recruits in greater numbers. There are three main centers of enlistment in the United States—at Fort Shoom, New York; Fort Jefferson, St. Louis; and at Columbus, Ohio. In New York city the recruiting officer is abroad in the streets and parks, bearing his placard which sets forth the advantages of enlistment. In Herald Square, Madison, Union, and City Hall parks, and at the Battery, he may be seen every fine day between the hours of eight and five, expatiating to groups of interested but individually shy spectators upon the advantages of an army life. You may see similar advertisements staring at you inside the sun-fare cars.

Fort Shoom, where applicants receive their final tests and are sworn in, is fed by eight substations, of which the most important are located, one on the lower Bowery, under the charge of Lieutenant Colonel Hardin, and the other on Sixth Avenue near Forty-second Street, commanded by Major Kenly. That the new methods have already attained considerable success may be seen by a glance at the miscellaneous mob which divers itself in the parlors of these substations daily. Most of these are obviously men out of employment; but one sees occasionally a clean, alert, well-dressed young applicant, to whom the army will clearly offer a career rather than a job. For the rest, they display a curious reluctance to commit themselves, and a powerful fascination for squinting through the half-closed doors of the rooms wherein soldiers in trim uniforms are busily recording the names of appli-

cants and filling out descriptive sheets. They line the darker portions of the passages, hanging, like Malenka's coffin, between the heaven of freedom and the inferno of discipline. Or the process may be compared to that of the swimmer entering cold water. The man who shivers on the shore is the ill-lad street beater, who peeks cautiously up the stairs, evidently afraid of bodily rapture and enforced enlistment. Then there is the man knee-deep who has committed himself to the medical inspection with well-defined mental reservations, and calls to his friend outside, "Come on in, Bill; the army's lovely." Again corresponding to the man who takes the plunge and comes out spluttering and shivering, there is the not infrequent applicant who proves acceptable, goes to Fort Shoom, passes the doctors, and at the last throws down the pen and refuses to sign his name to the enlistment form.

The examinations at the two substations, which consist of medical tests made by non-commissioned officers of long experience, and of a cross-examination by the commanding officer, as for the purpose of weeding out candidates whose applications are hopeless, and are only preliminary to the more severe examination which the army congress conduct at Fort Shoom. Nevertheless, something like fifty per cent. of all who apply fail to qualify.

And, the German corporal, regards the rejection of a likely-looking man with positive pain, and often expostulates with Sergeant Smith, a veteran with a service record of twenty years, whose medical knowledge is equal to that of many a surgeon.

While this preliminary examination does not determine a man's fitness or unfitness for the army, it eliminates from the work of the surgeons at Fort Shoom such details as measuring height and weight, chest expansion, etc. Frequently a nervous fellow, whose bearing or eyeglass is set down on the sheet as defective proves acceptable to the army doctors; while in numbers of cases men passed as sound are subsequently refused on account of some unsuspected organic disease. All men whose admission is considered doubtful are sent up to the Fort with explanatory remarks upon their disabilities.

"Next man," cries Sergeant Smith, beckoning to the nearest of the cluster of applicants in the anteroom, who are sitting huddled together, wholly devoid of clothing, and more or less embarrassed at seeing themselves in such unconventional guise.

"Next man" ambles forward and is placed on the weighing machine. His height is taken, and height and weight compared with the official maximum and minimum allowed by the government tables. His chest is measured, his limbs and defined. Next he has to read off, with either eye alternately, a line of letters on a card suspended from the opposite wall. Four mistakes in this eliminate the recruit from the contest.

"Now stand over here," says Andy, when the man has emerged from this test safely. He closes one of his eyes. "Repeat in a loud voice what you hear the sergeant say."

"Twenty-three," whispers the sergeant from his post against the opposite wall.

"Fifty-nine," says the recruit.

"Seventy-nine," says the sergeant.

"San Francisco," says Andy.

"May God Bless you," says Sergeant Smith.

"That's all right," says Sergeant Smith.

"You was a bit horse; I couldn't hear you very well myself. His car's perfect, Bill."

A new Plans Scooting for Recruits in City Hall Park, New York

"Well, as he's passed all the rest, I'll send him to the Fort, then. Next man."

"Now there's a nice-looking little fellow for you," says Corporal Andy, as a fair-haired, dejected-looking youth shambles forward.

"He won't do, Andy; he's knock-kneed."

"Oh, don't be hasty; give him a chance, BILL."

"Well, git up on this machine," the sergeant growls. "Quarter of an inch too short. Why didn't you git your father to stretch you out before you came?"

"He's got his hair smoothed down, Bill. He's the bright sure enough. Give 't's fellow a chance." The applicant just reaches the minimum weight, with a few ounces to spare; his chest measurement is satisfactory also, but he can only inflate it an inch and a half.

"We can't take him, I tell you."

"Oh, don't be hasty, Bill. Give the poor fellow a chance. He'll grow."

"Stand up," the sergeant shouts. "Lift up your legs. See if you can kick yourself. Wriggle your feet. I tell you ones for all we can't take him. He's flat-footed. And narrow-chested and knock-kneed, and just look at them spavins and ringbones. And an albino. Here, you, this ain't no frisk museum. Git out and git your clothes on."

For such as have passed the medical inspection there remains the examination by the recruiting officer. The colonel sits in his room, smoking a cigar. For each of the male, shivering applicants he has the same list of questions and horribly personal questions. From the manner in which they are framed one would think the would-be soldier was rather some traveler seeking the shelter of this country's laws.

However, they are rattled off at such speed that they partake more of the nature of a monologue. Interpreted by the monotonous replies. Moreover, the War Office has framed them so wisely that all those queries which need a negative response are couched in the negative form, while the rest are in the affirmative. For example:

"Have your parents given their consent to your enlistment?"

"Yes, sir."

"You have not applied elsewhere to join the army?"

"No, sir."

"You have not been in any jail or penitentiary?"

"No, sir."

"You are not addicted to the use of drugs or intoxicating liquors?"

"No, sir."

"Do you consider yourself of sound health?"

"Yes, sir."

"Have you ever had any serious diseases?"

"Well, sir, when I was a baby—"

"Never mind about the history of your childhood, sir," says the colonel, severely. "Do you suffer from fits or convulsions?" And so on.

When finally the applicant has passed these examinations he is held at the recruiting station for a day or two, until a batch is ready to be sent up to Fort Slocum.

That the efforts now being made to obtain recruits have had some success is shown by the fact that something like forty men are now being received at the Fort every day. The minimum for the past few weeks has been thirteen, and the maximum sixty-eight. The knowledge of the new bill for increasing the army payroll has also powerfully contributed to this increase, the authorities believe. The new recruits are retained only for a week or two, sufficient time to teach them the rudiments of their drill. Every month some 1200 are sent away to various stations.

The medical test at Fort Slocum is much the same as that given at the substation, certain details being omitted. The proportion of those rejected is not very large, and is mainly due to the discovery of heart disorders. Occasionally, as stated above, a man balks at the last stage, when required to swear in, in which case there is nothing which can be done except to let him go free.

The conversion of the undisciplined citizen to the untrained soldier is a very striking. The shabby, unkempt recruit, often marked with the "B" of the Berserker, proceeds to the quartermaster's store for his kit: blankets, uniform, caps, gloves, socks, underwear, shoes; all of the finest possible quality. He emerges a different figure. The rest for the military life has already stamped him. He holds himself unconsciously straighter. He is one of the army.

The act of Congress dated February 2, 1901, provides that the regular enlisted strength of the army shall not exceed 100,000, but if any attempt were made to obtain this maximum of recruits, drastic changes in the methods of recruiting would have to be made, and greater inducements offered. The total number of soldiers of all grades and branches which the War Department aims at maintaining amounts, exclusive of the provisional force and hospital corps, to 70,000 men. The present strength is 57,000. Of the theoretical 70,000 soldiers the fifteen regiments of cavalry, which never lack their full complement, comprise nearly 14,000 officers and men; the six regiments of field artillery, 8,500; the six Cavalry regiments close upon 20,000; the thirty regiments of infantry, 27,000; the engineers, 20,000; and the remainder consist of the staff corps, Indian scouts, and a small number of native soldiers in Porto Rico and the Philippines. The total number of commissioned officers amounts to about 3100.

There are thirteen military departments, those of the East, with headquarters at Governors Island; the Gulf, with headquarters in Atlanta; the Lakes, with headquarters at Chicago; the Missouri, with headquarters at Omaha; Dakota, with headquarters at St. Paul; Texas, with headquarters at San Antonio; the Colorado, comprising Colorado, Utah, Arizona, and New Mexico, with headquarters at Denver; California, which includes Hawaii, with headquarters at San Francisco; the Columbia, comprising the northwestern States and Alaska, with headquarters at Vancouver Barracks, Washington, and the three departments of Arizona, the Visayas, and Mindanao, in the Philippine Division. The thirteenth department is that of the Army of the Pacific, having its headquarters at Havana.

It will thus be seen that our little force of 70,000, now twenty per cent, below strength, is spread out with extreme thinness over the length and breadth of the continent. But this comparatively puny force is supplemented by the various State National Guards, which together form the organized militia of the United States, and total 165,000 men, thus more than doubling the strength of the regular army. In addition

to this there is an unorganized reserve militia of 13,821,096 non-combatants—that is to say, the estimated total number of male citizens capable of bearing arms, who are included in the defense scheme of this country under the militia law of January 21, 1903, which provides that "the militia shall consist of every able-bodied male citizen of the respective States . . . and shall be divided into two classes, the organized militia, to be known as the National Guard . . . or by such other designations as may be given them by the

laws of the respective States or Territories, and the remainder to be known as the reserve militia."

While the bulk of our "reserve militia" is woefully untrained, there is no doubt that in the event of war with a first-class military power it would speedily develop into a formidable organization, as was shown by the fighting ability of our volunteer soldiers during the last little war with Spain. Some of the best raw material was furnished during the Civil War by the mountaineers of the Allegheny region, numbering now, in all, a population of 3,000,000. But above all we have several hundred thousand trained and disciplined soldiers available for service from among

A Squad of Recruits at the Registry Office at Fort Slocum, New York, where they have just been sworn in as Soldiers

has now been adopted by all the larger Powers of Europe, as well as by Japan.

One of the factors which operate to prevent the establishment of a large peace force is the much higher cost of the American army when compared with those of foreign countries. Not only is the soldier untrained in quality and quantity of his, but he receives rations on the civilian scale, instead of the miserable and badly prepared food which is thrown to the soldiers of Europe. The pay, which in most Continental armies averages from two to five cents a day, and in the British starts at \$7 a month, is never less than \$13, increasing to that of a skilled mechanic. Further-

From the Registry Office the Recruits go to the Quartermaster's Department to draw their Equipment

our large influx of immigrants, a considerable proportion of whom have served their two or three years of military service in the land of their birth.

The prestige of the professional soldier has waned in some degree since the British regulars were "held up" by a handful of Dutch hunters and traders, and the system of small peace effective and large reserves, as distinct from the old-fashioned conscription,

more, the eight cents a day pension of the retired British regular is represented here by a substantial sum, sufficient to support life with a certain degree of comfort. The United States army budget for the past fiscal year amounted to over \$100,000,000, exactly half that of Germany, with her immense force, and more than half that contributed by France. The American army costs more than that of either Italy or of Japan.

HARD TIMES AND THE ARMY RECRUIT

THE somewhat thin ranks of what Kipling calls our "dear little army" are being replenished in a measure at present owing to the hard times and the usual migration toward Uncle Sam's barracks of the "snow birds." The "snow birds" are not really birds at all. They are those men who either through misfortune or incapacity or an unwillingness to the president and find it easier to enlist, and be insured the fatherly care of a quartermaster and a governmental commissary during the rigors of winter, than to seek precarious work outside Uncle Sam's preserves in the wilderness of an unsympathetic and businesslike world. These men are annually expected by the ever-hungry officers of the American army, and they have arrived as usual. But in addition to them the hard times have turned others to the recruiting stations, and army officers have got their hands full in some quarters turning this raw material into the finished product of Uncle Sam's military mill. The recruits are welcomed even though

they bring the customary cases of measles, mumps, and so forth, into the army posts. For it is an established fact that army recruits almost invariably introduce diseases, and usually of an insidious nature, though they have just successfully passed the severe physical examination necessary for their acceptance. The disease develops later, and is passed cheerfully from man to man before science has its progress. If the officers have children the family is fortunate that escapes the measles brought in by recruits to the army posts. Men from the cities who enlist are more apt to be immune, having run the gamut of all the usual ills of the flesh; it is the healthy country boys who are the chief victims of the enterprising germ. Later, however, the stamina of the country boys frequently proves stronger than that of the men from cities. But with or without measles the recruit is needed in our army, and if the hard times produce him and get him safely enlisted it is another illustration of the adage about an ill wind.

For the "Honor" of France

IN France, for which so much is claimed as the most highly civilized country in the world, the "sport" of cock-fighting is carried on openly and oftentimes in the presence of public officials. This, at least, is the case at Auchel (Pas de Calais), a mining town of 12,000 inhabitants. At a cock-fighting main held there recently no fewer than forty-eight "securities" fought nearly three hundred birds in one hundred and fifty battles to decide the championship of the north of France. The fighting began at ten o'clock in the morning and was continued until half past eight in the evening. The brutal business had been advertised to the public for days in advance.

Carrying the Fighting Cocks to the Main

THE contests took place in the Salle de Gymnastique, a large and well lighted hall with a gallery built especially for the crowd. Some three thousand spectators kept up a continuous babble of betting and cheering on their entries or jeering at those that showed the white feather. The birds, full feathered and full combed, but wearing steel spurs with needle points, were thrown together in an enclosure pit measuring twelve by eight feet, erected in the middle of the hall. Wire netting fenced in the pit, and the floor was covered with fine tan-bark. The Mayor of Auchel and the Commissary of Police were interested spectators in the balcony.

The Mayor of Auchel (hatless), and on his Left the Chief of Police, watching the Cocking Main

Fastening the needle-pointed steel Galls on a Cock before thrusting him into the Pit to Fight

AVIOLENT brass band ceased its heaving. Two birds were thrust through little doors at opposite ends of the pit. There was silence. The birds stood still and glared. The heads moved jerkily, but with infinite care, as each bird sought an opening. Suddenly one sprang in, seized the other by the comb, and, leaping up, drove both spurs into his breast. The victim fell; made spasmodic efforts to rise—and died. The timekeeper solemnly regarded his stopwatch until three minutes had passed; then pointed to the winner. His backers cheered, collected bets, and chattered about the next bout.

Two Game-cocks fighting for the "Championship of the North of France" in the Main at Auchel

THAT was the programme all day except when an occasional bird was away after fighting a few moments, only to have his head chopped off by his angry owner. "Of course the law forbids cock-fighting," a prominent police official replied to one who inquired. "That sport is not allowed in France: It is tolerated. You understand? It is impossible to stop it. If we tried we should have a revolution among these miners, nearly every one of whom breeds and trains fighting cocks. The Deputy for Auchel has offered a magnificent wager to the owner of the champion of this tournament."

A Tale of Three Cities

SYRACUSE

ROCHESTER

BUFFALO

By EDWARD HUNGERFORD

THE three great cities of western New York—Syracuse, Rochester, Buffalo—are like jewels to the famous railroad along which they are striven, and they serve to offset the great metropolitan district at the eastern end of the State. They have many things in common, and yet they are not in the least alike. Their growth has been due to virtually a common cause: the development of transportation facilities across the State; and yet their personality is as varied as that of three sisters: lovely—but different.

Of the three Rochester is the most conservative; Buffalo, perhaps, the most progressive; Syracuse, certainly, the most ingenuous. Rochester proves her conservatism by her smart clubs, her cultivated inhabitants, almost by the fact that certain excellent persons there frown upon newspaper reports of their social activities. In Syracuse, on the contrary, the Sunday papers have columns of "society notes," and the reporters who go to dances and receptions prove their industry by writing long lists of the "among those present." Buffalo leans more to Syracuse custom in this regard. Rochester was rather critically the man who comes to dwell within her gates. In Syracuse, and in Buffalo too, there is more of a spirit of camaraderie. A man is taken into good society there from the start because of what he is, rather than for that from which he may have sprung. So it may be said that Syracuse and Buffalo breathe the spirit of the West in their social life, while Rochester clings firmly to the conservatism of the East. Indeed, her citizens rather like to call her "the Boston of the West."

Take these cities separately and their personality becomes the more pertinent and compelling. Consider them one by one as the traveler sees them on a westward train—Syracuse, Rochester, Buffalo—and in the same grading of population, for they increase, roughly speaking, in a geometrical ratio. Syracuse has a little more than a hundred thousand inhabitants, Rochester is about twice her size, and Buffalo is about twice the size of Rochester.

Each of them is a result of the Erie Canal. There had been famous postroads across central and western New York before De Witt Clinton dug his great ditch, and the Mohawk valley and the little known "lake country" of the State formed one of the earliest passageways to the unknown West. But the Erie Canal,

providing a water level from the Great Lakes to the Hudson River and so to the Atlantic, was a tremendous impetus to central and western New York. Small towns grew apace, and the three big towns were out of their snaddling clothes and accounted as cities almost before they realized it. The building of the railroads across the State and their merging into great systems was a second great step in their transition, and the third is now in progress—the planning and construction of a network of international trolley lines that shall again unite each of the three, and—

what is far more important to each—bring a great territory of small cities, villages, and rich farms into closer touch.

In Rochester a good many years ago one Sam Patch jumped into the falls of the Genesee. He first planned his spectacular jump on a Sunday, but the citizens of Rochester, like the citizens of Rochester, on a Friday, which almost any superstitious one might have recognized as an unfortunate change of date; and, jumping, he did not survive to jump again. But the point of this narrative hinges not on Fridays, but upon Sundays. In the strict little town of Rochesterville. All that was a long time ago, but Rochester has not changed much since then in her ideas of Sabbath observance. The citizens of that charming city still go to church on Sundays, and they "point with pride" to the big and progressive religious institutions of their community.

People in Syracuse, however, have Sunday picnics and outings off into the country on that day, and her larger sister, Buffalo, has always been known for its "liberal" Sunday—whatever that may mean; while Rochester has rather frowned at that sort of thing. Even her moxy beach down at Ontario's edge, which is a sort of Coney Island to western New York, has been a thorn in the side of her conservative population. If you want to stop and consider how the old-fashioned Sabbath of your boyhood days still reigns in the city at the falls of the Genesee, accept as proof the fact that in one street that is bordered by some of the town's largest churches the trolley cars are not operated on Sunday. Think of the possibilities of that sort of thing in New York, or Chicago, or Pittsburgh, or San Francisco!

Syracuse is famed for the Onondaga Indians and for James

A City built on a Towpath. Clinton Square, Syracuse, bisected by the Erie Canal. The old Canal is to disappear—Some Day

Syracuse University and "Mount Olympus." It is proud of its designation as a "poor man's college," and its Three Thousand Students come from the small Cities, Villages, and Farms of the Region which the Metropolis describes as "up-State"

Main Street, Rochester—the Heart of the Commercial District of the second largest of the three Sister Cities of Western New York

Roscoe Day. The Onondaga Indians are the oldest inhabitants and great help to the ingenious local artists who design cigar box labels. No apologies are needed for Chancellor Day. He has taken a half baked Methodist college that stood on a wind swept hill, and by his indomitable ability and Simon pure genius has transformed it into a real university. For Syracuse University is tremendously real to the three thousand men and women who study within its halls. It is a poor man's college, and Chancellor Day is proud of that. They come, these men and women, from the small cities and villages, the fat farms of that which the metropolitan is apt indifferently to term "up-State." To them four years is a university means four years of cultivation, and to that spirit is due the growth, the vast hidden power of Syracuse University. Syracuse makes no claim to a college spirit of surpassing dimensions. She does claim a spirit among her students second to none. As a university—as some know a university—her collection of ill matched architectural oddities that house her is typical, but as an opportunity for popular education to the boys and girls of the rural districts, she is monumental, and the boys and girls come swarming in her in greater numbers each autumn.

So much for the hills—they call it Mount Olympus—which holds the university and those things that are the university's. Now for downtown Syracuse, for the city's newer districts are ranged upon a series of impressive heights, while her old houses, her stores, and her factories squatted upon the flats at the head of Onondaga Lake.

We all remember the pictures of Syracuse that every self-respecting geographer used to print: salt sheds running off over an indefinite acreage. We were given to understand that Syracuse's chief excuse for existence was as a sort of huge salt-cellar for the rest of the nation. Nowadays nine-tenths of the Syracusans have forgotten that there is a salt industry left, and will tell you glibly of the typewriters, automobiles, steel tubing, and the like, that are made in their town in the course of a twelvemonth.

They will not tell you of one thing, for of that thing you may judge for yourself. Life in Syracuse is punctuated by the railroad and again by the canal. The canal is not so much of an obstruction unless one of the cumbersome bridges sticks and refuses to budge up or down, but that railroad! Every few minutes life in Syracuse comes to an actual standstill because of it. Men whose time is worth ten or fifteen dollars an hour and who grow puffy with overindulgence are violently halted by the passing of way-freights. Appointments are missed. Board meetings at the banks halt for directors—directors who are halted in their turn by the dignified and stately passage of the *Cannotta* Local through the heart of the city.

But the old canal is going to go, some day—when the State's new \$101,000,000 large canal well to the north of the town is completed—and perhaps in that same day Syracuse will have a broad central avenue replacing the present dirty, foul-smelling ditch. Some day some very big Syracusan will miss an appointment while he stands in Salina Street watching the serene *Cannotta* Local drag past him, and that missed appointment will cost the very big Syracusan a lot of money, and there will be revolution in Syracuse—a railroad revolution. After that cheery engine will no longer blow their smoky breaths against the front of the best Syracuse hotel, and grind their way slowly down Washington Street from the depot to the tunnel, as it suddenly unconscionable that they are acting no barriers of progress, The Chicago Limited held up the Carnival parade last September, and thereby has another chapter of this story.

Syracuse is the fiefdom of these three sisters. Buffalo sighs and remembers her lovely Pan-American Exposition of a few years ago, and Rochester is far too laudatory to stoop to the show business. But Syracuse does not care for appearances or halt from pride. She rolls up her sleeves, her business men

swell the subscription lists, her matrons and her pretty girls—and pretty girls at a Syracuse Carnival are thicker than sweets in a plum cake—give themselves, and there is a concert of action that gives Syracuse the liveliest, hardest work of any town in the East. By day folk go out to the State Fair and see the best agricultural show that New York State has ever known—a veritable agricultural show that endeavors not only to furnish an ample measure of fun, but endeavors to be a real help to the progressive owners of those fat central and western New York farms of which we have already spoken. By night Syracuse is in festival. Do not let them tell you that an American town cannot enter into the carnival spirit and still preserve her graciousness and a certain underlying sense of decorum. Tell those scoffers to go in Syracuse during State Fair week. They will see a demonstration of the contrary—Salina Street ablaze with incandescent beauty, lined with row upon row of eager citizens. The street is closed off for a broad strip of stone carpet down the centre of the thoroughfare, and over this carpet rolls float after float, typifying the nations of the world—we remember that last September the Queen of Ancient Ireland wore eyeglasses, but that is as nothing; the policemen in Boston are also addicted to straighteners—and Mr. Syracuse and Mrs. Syracuse, Master Syracuse and Miss Syracuse stand open-eyed in pleasure, and go home very late at night on trolley-cars that are crowded as are trolley-cars in very big cities, convinced that there may be other towns, but that the city of Syracuse is unique.

Therein lies Syracuse's great hope for her future. Her citizens are optimistic; they pull pretty well in harness, and as they accomplish much. Underneath all of that their pride is the real foundation. A stanch civic pride is the skeleton construction that supports the structure of this city of the classic name; it is a construction that admits of an infinite growth being placed upon it—and Syracuse stands ready for infinite growth.

Rochester, as we have said, differs totally from her sister town. No vulgar railroad dross to obstruct a main business street of Rochester; in fact that city was one of the first in America to remove the drably grade crossings from her avenues, and incalculable fatalities and near fatalities have been prevented by the wisdom of a quarter of a century ago, when the trunk line railroad that crosses her from east to west was placed on a great viaduct. When this viaduct was built a great change came upon the town. The old depot, with its vaulted wooden roof clearing both tracks and street and anchored in the walls of the historic Brackett House, with the ancient white horse swishing the ears of earlier days (it is years and years and years since that white horse went to graze in heavenly meadows), vanished from sight, and a great stone lined embankment—high enough and thick enough to be a city wall—appeared as if by magic, and Rochester revelled in a great new station, big enough and fine enough, it seemed, for all time. At least that was the way Rochester viewed its station when it was first completed away back in the early eighties. Nowadays that same station is dirty and crowded and small, and the railroad people are planning something newer and bigger and better for the town that is to come within the next two years.

In that way the city has grown apace, and quite ahead of the facilities which earlier generations thought would be abundant for all time. The high civic standard that forced the great railroad improvement in early days when most American towns, like Topsy, "just groined," and gave little thought for the morrow, made Rochester "different" in those same early days. It made Rochester seek to better her water supply, and in this she succeeded by tapping a spring pure lake forty miles back in the high hills. That was a large undertaking for a small city, but the small city was plucky, and it now has a water supply only second to the Croton system in New York, and one which will stand as a model for years and years to other ambitious towns. That same civic standard made fireproof buildings an actuality in Rochester years in advance of other towns of the same size.

Livingston Park, Rochester, suggesting the tranquil Streets of a New England Town rather than a bustling Lake Shore Community

But the glory of Rochester lies not in her waterworks, her public buildings, or her parks; and Rochester parks are superb, for Nature has been their landscape architect, and she has executed the city's commission in regal fashion; nor does it reside in her grand Main Street, nor her vast manufacturing plants that may be translated into stunning arrays of statistics; it lies in her homes. The treatment, as we know it in the big cities, over the city house with its cold dead walls, are unknown there. Apartment houses are rarities, and consequently oddities. Your Rochesterian—rich and poor—dwells in a detached house on his own tract of land; the chances are that he has market track growing in his back yard, a real kitchen garden. There are thousands of these little homes in the outlying sections of the town, with bigger and more pretentious ones lining the chief avenues, and all of these together are the reputation of the town.

The citizens of Rochester, in less proportion than most other towns of the size, are not only governed, but, in greater proportion, they govern. That is the value of the detached house to Rochester. The detached houses mean good schools, good fire and police service, clean streets, a system of street lighting and a system of protection for the public health that are unexcelled in America.

A long street filled with somewhat monstrous rows of simple frame houses does not mean much at a glance—even when the street is parked and filled for a mile with blossoming magnolias, as Oxford Street, Rochester, is filled. But such a street, with other streets of the same sort, means that the charm and homeliness of American village life are carried right into the heart of a community of goodly size.

Sometimes citizens from other towns call Rochester provincial, and sometimes they are partly right. Rochester has clung to her small town customs longer than have some of her neighbors, but already she is attempting metropolitanism—they are building two big new hotels in the place, and some radicals have dared to place a building or two off Main Street. But Rochester, like most conservatives, is careless of outside criticism. She is quite sufficient unto herself. Her citizens derive a good time out of life. Miles upon miles of splendid highways surround them, the great South Park which spreads along the island of Genesee runs persuasively to the coast, the great lake to the north gives favorable breezes to the yachtman. So the Rochesterians realize that they live within a fair and garden country, and they live their healthy lives to the fullest extent, in the open of a summer that stretches month upon month, from early spring to late autumn.

Concerning Buffalo, let me ask if you ever met a man from that city when you were travelling, and did he tell you something of the town that sheltered him? If so, he undoubtedly began by quoting marvellous statistics, most of them relating to the number of trains that arrived at and departed from his town in the course of twenty-four hours. When he was through, you had a confused idea that Buffalo was some sort of an exaggerated railroad yard, where you changed cars to go from any one corner of the universe to any other corner. When your time came to see Buffalo for

Buffalo is said to defend herself against the Charge of Provincialism by an occasional Office Building like this

yourself, your confused idea returned to you. Your train slipped for miles through an apparently endless wilderness of branching tracks and dusty freight-cars, past roundhouses and steaming locomotives, until you were ready to believe that any conceivable number of trains arrived and departed from that busy town within a single calendar day.

But for a long time she has longed to be something more than a mere railroad yard. She has dreamed metropolitan dreams, more ambitious dreams than either of her sisters. The dull roar of Niagara, infinite in its possibilities of power, is within hearing, and that has been Buffalo's incentive, the bellamy which induced her dreams of industrial as well as commercial supremacy. But an industrial metropolis hardly made in less than half a century; and Buffalo, to make her claims of plentiful power and commanding situation better known, resorted to tremendously expensive advertising: the holding of a big exposition, save for the monumental tragedy which darkened its closing days, and it reaped great credit upon the energetic towns that deeded it.

No much for Buffalo industrial and Buffalo commercial—a look might be written upon each of these phases of the western gateway of the State; the real Buffalo is the thing upon which we peg our interest. The real Buffalo is to be found in her typical citizen, just as her thousands of homes are the secret of Rochester. The typical Buffalonian is optimistic and energetic to a singular degree, and he needs only these qualities for Buffalo is just upon the verge of becoming metropolitan, and the problems of her exceeding growth demand cool heads and stout hearts.

The Buffalonians have a full measure of enjoyment in their city. They are intensely proud of it,—remember that man who once told you about the number of railroad trains that arrived and departed, within twenty-four hours,—and thoroughly happy in it. Niagara Falls, and a half dozen of lake beaches on Erie and Ontario, are within easy reach, and nearer still is the lovely park of the town. So they live outdoors—these Buffalonians—whether they are able to patronize the charming Country Club, or are persons of less prominence who have just as good a time in less pretentious suburban resorts. They play at golf, at baseball, at football, and in the long hard winter months, at basketball and hockey and bowling. They organize teams in all these sports—and some others—and then they go down to Rochester and enter into amiable contests with the folks that live by the Genesee. Syracuse, too, comes into the fray, and these three sisters of the western end of the State fight out their natural and healthy rivalry in series upon series of sturdy athletic championships.

In personalities and in individual characteristics these three notable cities are as unlike as one might expect three sisters to be. But blood is stronger than water, and Syracuse and Rochester and Buffalo are sisters. They are the breezy cousins of New York State, the strength of "up-State," the communities that help to make New York an Empire State whether you consider it with or without the great metropolis with which it faces the sea.

A View of the vast industrial Region of Buffalo, by which she demonstrates her Commercial Supremacy over her smaller but not less attractive Sisters

Anglo-American Arbitration

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

ENGLAND is quite resigned to the prospect of another Anglo-American arbitration treaty. There is no enthusiasm for it—under the circumstances none could be expected—but there is an entire willingness to move in the matter if there is a reasonable chance of avoiding a fiasco. I think I fairly sum up the opinions of those Englishmen who have interested themselves in this question, when I say that in their judgment an Anglo-American arbitration treaty must be either a downright failure or an extremely partial, incomplete, and defective success. If it has any real vitality, it will be rejected by the Senate. If the Senate accepts it, it is a proof that it is destitute of reality, and leaves things fundamentally as they were. Such is the moral which Englishmen have extracted from the history of previous attempts to negotiate an arbitration treaty with the United States. Such is the alternative with which they feel themselves confronted; and the justification for their attitude is to be found in a review of the fate of the Olney-Pauncefote and the Hay-Durand treaties.

The Olney-Pauncefote treaty was negotiated in the heat of reaction from the quarrel over Venezuela. Thoroughly scandalized and ashamed by the possibility of war over such a trumpery dispute, both nations, in an access of idealism, rushed off at a tangent and began swearing eternal friendship. The American masses, however, soon tired of the pastime. They began by loudly applauding arbitration in the abstract; they quickly developed a profound repugnance to it in the concrete form in which it was presented to them by Mr. Olney and Lord Pauncefote. Nor could any Englishman who really understood the issues that were involved find it possible to blame them. The Olney-Pauncefote treaty was an extremely stringent and far-reaching instrument, far more so than any of the multitudinous agreements to arbitrate that have since been concluded among the Powers of Europe. It was offered to America at a time when "the man to the oars" was possessed by a most flattering senselessness of the subtlety and long-headedness of British diplomacy. Distrust was in the very air. The Americans felt that somehow they were being "had." They could not lay their finger on a single clause or a single paragraph in the treaty that threatened in any way to compromise the national honor, to abridge their liberty of action, or to hamper their powers of self-defence. But the more the treaty was looked into and the more innocent it seemed, the keener grew the American conviction that beneath its guileless provisions lurked somewhere a peril all the more terrible for being undefinable. What was, in fact, merely a first-rate specimen of blundering Anglo-Saxon altruism based on the imaginations of Americans a skilful and diabolically crafty assault on their diplomatic inexperience. They rejected. I well remember, over its defeat as though they had escaped a great national disaster.

To this instinctive distrust there was added the open hostility of the professional Anglophobes. Englishmen are always apt, when anything goes wrong in their relations with America, to blame "the Irish vote." A great many of them thought and still think that but for the Irish vote the Olney-Pauncefote treaty would have been ratified. Only a day or two ago one of the ablest of English publicists asserted me that the Senate was terrorized into rejecting it by the activities and threats of Michael Davitt. There is one other explanation which Englishmen also fall back upon to account for any American action that they cannot quite understand. That explanation is summed up in the word "politics." "Politics" in this instance was represented by the fury of the defeated Bryanites, who watched at any weapon that could embarrass the Republicans. But whatever might have been the causes, the result was at least clear enough. The Senate first annulled the treaty by amendments, and then rejected it by forty-three votes to twenty-six; and it was an open secret in Washington at the time that many who voted for it only did so because they knew it would be defeated. Englishmen were, naturally, a little baffled. They had been asked to negotiate an arbitration treaty by the American Secretary of State, and they had agreed. Their reward was to find Anglo-American relations from the Revolution onwards dragged into the cockpit of popular passion, and to see the treaty in the end decisively rejected. They could not understand it. Their utmost effort in solving the mystery led them, as I have said, to ascribe the failure of the treaty partly to its excessive stringency, partly to popular misapprehensions of all British diplomacy, partly to the influence of the Irish-Americans, and partly to the exigencies of politics.

My own impression is that these factors undoubtedly contributed something to the defeat of the Olney-Pauncefote treaty. But I also think that the common English opinion which regarded them as the decisive factors, and which thought that, had they not existed, the treaty would have been ratified, was wholly erroneous.

Its baseness was, indeed, proved by the event. Seven years later, in 1905, the two governments took up the matter again. They negotiated another arbitration treaty and again submitted it to the Senate. None of the objections urged against the Olney-Pauncefote treaty could be made to apply to the Hay-Durand agreement. It was of far narrower scope. It excluded all questions of "national honor" and "vital interests." It confined to juridical questions and the interpretation of existing treaties. It was, in short, as mild an instrument as any arbitration treaty could be without losing all its efficacy. Moreover, the circumstances in which it was negotiated and presented to the Senate wholly differed from the circumstances of 1897. In the first place, it did not stand alone. It was one of a batch of seven arbitration treaties, all identical in provisions and effect, that Mr. Hay had negotiated. In the second place Anglophobia in 1905 was passive to the point of being almost moribund; Americans had grown to believe in the efficacy of British diplomacy; "politics" no longer presented an obstacle; not "the Irish vote" had lost practically all its influence. Everything therefore seemed favorable to success. Yet the Hay-Durand treaty, like all its companions, was so mutilated by amendments that President Roosevelt declined to proceed with it.

It was this which first opened the eyes of Englishmen to the realities of the situation. All their stock explanations fell to the ground. They saw that they had overlooked or failed to take into account some factor that vitiated all their calculations. What this missing factor was it did not take very long to discover. The English cannot be blamed for not having recognized it and apprised it earlier. What is really surprising in the whole affair is that statesmen like Mr. Olney and Mr. Hay, and Presidents like Mr. Cleveland, Mr. McKinley, and Mr. Roosevelt should have been equally blind to its controlling significance. The best-acknowledged reason why the treaties of 1897 and 1905 were rejected or emasculated was that the Senate regarded them, and to my judgment justly, as an invasion of its constitutional rights. Their failure, in other words, was not due to temporary and accidental causes that might have been ended, but to permanent and fundamental conditions that could not be altered and had to be allowed for. In this matter, I should like, if I may, to disclaim the cautious manner of being wise after the event. I opposed the Hay-Durand treaty from the initial stages of its negotiation; I did what I could to convince the British government of the inevitable shipwreck that awaited them; and I prophesied the precise rock on which they would come to grief. I am so far from taking my credit for this that I do not see how any one even moderately acquainted with the terms and workings of the American Constitution could ever have convinced himself that an effective and automatic arbitration treaty with the United States was a political possibility.

The Constitution gives the Senate the final voice in the conduct of foreign relations; all treaties to become operative must be ratified by a two-thirds majority of the Senators present. And the Senate is a highly "tortuous" and sensitive body, tenacious to a degree of the prerogatives that belong to it by right and still more of the prerogatives it is able to exert from weak-kneed Presidents. It is about the last assembly on earth to surrender any of its authority, least of all on so vital a matter as the control of foreign affairs. But an arbitration treaty is a challenge that authority at its tenderest point. It cannot help doing so. The essence of all such treaties, if they are meant to have any vitality at all, must be that two Powers agree to refer to arbitration certain questions. But if provision is made for the automatic arbitration of any questions, however unimportant in themselves or quality, it must be that extent impinges upon the prerogatives of the Senate. It practically takes away certain powers that the Constitution vests in the Senate and transfers them to the President. It evades the Executive at the expense of the Legislature. It allows the President to carry a negotiation with a foreign government through all its stages without consulting the Senate. To ask the Senate to concur in a general arbitration treaty is, therefore, to ask it to commit political suicide or, at the very least, to ask it to abdicate in favor of its great rival, the President. An effective arbitration treaty with the United States is, in short, a constitutional impossibility. This is at last recognized, I should hope, both in Downing Street and the White House. Englishmen at any rate now understand that the Senate, while agreeing to arbitration as a principle, is bound to see to it that the principle shall only be invoked and applied with the concurrence of the two-thirds majority prescribed by the Constitution. Is an arbitration treaty on these limited lines worth while? Englishmen think it is. They do not expect it to add anything appreciable to the large and growing stock of Anglo-American goodwill, or to the increasing recognition of the community of Anglo-American interests. But they observe that nearly all the great Powers have for years been throwing bouquets at one another, and they think it quite time that England and the United States should join in the pastime.

HOW TO

DRAWN BY JAMES F.

FEEL WEAK

MONTGOMERY FLAGG

With the Fleet

WHILING AWAY THE ENDLESS MILES AND HOURS

By LIEUTENANT-COMMANDER PHILIP ANDREWS, U. S. N.

EXECUTIVE OFFICER U. S. S. "KANSAS" SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY"

U. S. S. "Kansas" at Rio de Janeiro, January 22, 1906.

Many vivid and delightful memories throng the mind, as we are about to leave this beautiful city, that it is difficult to say what has most impressed the officers and men of the fleet. At first we were so overwhelmed by the majesty and beauty of the vast harbor; then the rich wonders of the newly rebuilt city burst upon us, while we were being welcomed with a cordial hospitality that knew no bounds.

The genuineness and the depth of the friendship these generous Brazilians feel for us Americans are delightful. This is the one fact which we feel above all others. The hospitalities to officers and men and the evidences of good feeling on every hand have been endless. There can be no doubt as to the great good which accrues from the visit of such a fleet as this to our neighbors.

Of this charming city and its bay, rivaling Naples in scenic attractiveness, much could be written; also of the wonderful view from Corcovado mountain, thence which no prospect could be more attractive; but the great thing that has gone home to us all is the human touch of friendship and entire good will.

It is no exaggeration to say that the coming of the fleet to Rio has aroused among the Brazilian people the same degree of enthusiasm that was called forth by the visit of Mr. Root. Every one still refers to his visit, and it is evident that his message meant much to them. In honor of the fleet excursions, receptions, dances, lunches, and dinners come and go in an endless stream until it becomes a serious question as to how far our physical endurance can stand the wear and tear of such lavish entertainment. The admirals and captains have called upon the President of Brazil and the higher officials, they have been banqueted by the President, and the officers have been taken everywhere and treated with greatest cordiality. Possibly the best thing done by the residents here has been the establishment of a Bureau of Information and waiting room for the men, where American money can be changed into current money, and information obtained as to where to go and what to see in this wonderful city.

The Bureau of Information has been established by English speaking residents here as a branch of the Y. M. C. A. especially for this occasion. The men are directed what cars to take, what places are best to visit, and where to buy and see the Brazilian

things of interest. The waiting room is large and furnished with tables and writing material, so that the men have abundant opportunity to write home. For one mite, about thirty cents of our money, is furnished a typewriter letter describing the reception of the fleet and the wonderful sights of Rio. No doubt many of the men purchased this letter and sent it home. It was certainly very well written and worth sending.

The men of the fleet have landed almost four thousand strong every day, and have spread all over Rio and the surrounding country. They have been exceedingly well behaved, and their excellent conduct has called forth high praise from every one. The system of landing patrols inaugurated by Admiral Evans has been followed here with perfect results in co-operation with the shore police. Every day eight officers and nearly seventy men have been ashore on duty to look out for our own men. In sending the men ashore every precaution has been taken to prevent their getting any disease. Each man has been examined to see if his vaccination marks were good, and if he was likely to be immune from smallpox. Some men were unfortunate in not showing clear marks, and they perforce were kept on board and re-vaccinated. One youngster made an amusing mistake by showing the doctor the wrong arm, and, of course, was promptly put on side. He showed great disappointment until his mistake dawned on him, when he appeared again with the other arm bared and a face wreathed in smiles and was allowed to go.

The fleet was met outside Rio Harbor by four Brazilian men-of-war and escorted into the harbor. To-day, on leaving, eight Brazilian men-of-war will escort the ships outside, and the President of Brazil will visit the flagship and review the fleet from Fort Villegagnon as it passes on its way to sea. The ships will all be dressed with flags, and they will fire two salutes of twenty-one guns each in his honor, the crews of all ships manning the rail.

Christmas for the fleet in Trinidad was not much like a home Christmas, but the rites were carried out with as much real and scenic effect as was possible. Green boughs and palms were put at mastheads and yards after dark Christmas eve, and many of the ships had small trees in conjunction on the Christmas dinner table. The Kansas's Christmas tree was brought from Philadelphia, with its trimmings by our thoughtful marine officer, Captain Harding, who, with several others in the warlike mood, dressed it and distributed the funny little gifts. Most of the

The Nerve Centre of the Battleship "Kansas," the Wheel-house

Steaming away from Rio in single Column Formation

They have just finished the dirtiest job in the World—Coaling Ship

officers had Christmas boxes, which were opened quietly and enjoyed the more for the intimate glimpse of home they gave.

As usual, on our holidays athletic sports were held. All kinds of boat races were started early in the morning between ships and divisions on the same ships, but the one of greatest interest was the officers' race in the racing cutters. There were ten or twelve entries for a half mile race, which seemed endless to most of the officers who had not been in boats for practice for some time. One of the Kansas's midshipmen, who pulled in the race, exclaimed when it was all over, "Gee, that last ten miles was hell!" Before the start we all thought it was any one's race, with perhaps the chances in favor of the Louisiana or Vermont crew; but it developed that the Kansas crew were able to set the pace that day, and Kansas won the race.

In the last anxious moments, when the boats are at the line and the starter is laboring harder than Hercules to get them all in a fair array, the rowers are so full of hope and apprehension and thirst for glory that they find it difficult to breathe. At such a time the proper thing to do is to gruffly say the sweetest covey, thereby adding to his anxiety and giving yourself the air of one who is happy, gay, and free, as the poet hath it. As the twelve cutters lay bobbing on the waves of Rio Harbor, maneuvering for the start, it pleased Lieutenant Thos Osterham, in the cutter of the Louisiana, to direct a little tactical ballgame at Lieutenant Joe Tausig in the cutter of the Kansas. Mr. Tausig is still hurt from injuries received in the lower rebellion in China.

"Look at Tausig, fellows," Mr. Osterham advised. "Look at him and guess how many lengths we'll lose him."

"Take a long look and a good one," Mr. Tausig replied, "for it'll be your last chance. You'll never see me again after the start."

The race of mocking laughter from the Louisiana's cutter was broken by the crack of the starter's pistol. The Kansas crew got first into their swing and jumped well out in the lead. Moreover, Mr. Tausig proved a competent prophet, for his cutter held her lead all the way, lame leg and all.

How much the world ashore will learn from the high and unusual compliment paid to our blue-jackets by the British Governor of Trinidad! He wrote to Admiral Evans saying that he had enjoyed a large acquaintance at Gibraltar with sailors of all nations, and that the conduct of our men was a revelation to him, they were so quiet and well behaved. Certainly this is the rule, and it is no longer considered the proper thing among nations of our navy to get drunk and raise the devil. Nowadays, generally speaking, those who do get drunk ashore have a chance to take anything, and are consequently quickly and easily affected by a very little. They are swiftly and quietly picked up by our own patrols and hauled into launches that deliver them safe and harmless for mischief aboard their own ships.

Incidentally, it is curious to note how persistently the ancient tradition survives that the principal business of the blue-jacket ashore is to consume rum and produce riot. This legend may

have been authentic history in the days when Dibdin wrote his ballads and Captain Marryat spun his fascinating yarns. Even then one fancies that the word-painters may have hid on the colors a tinge thickly in order to make the picture stand out more vividly in the mind of the reader. What were the facts in those days?

The ships of the navy were manned in large degree by crews who at best were simple folk with few and crude ideas of amusement, and at worst by the riffraff of the shore picked up by the press gang. After a cruise of monotonous months under sail, it is surprising that many of these men suddenly set at liberty on the beach should amuse and fight? There was little other recreation for them, and in the reborn from an iron discipline in which man-handling was frequent and the humiliation of flogging a part of the legal punishment for venial offenses, it is not surprising that the poor fellows should plunge into excesses.

But the American blue-jacket of to-day is no different from that ancient type as the rule is different from the dodo. He is not drugged and beaten into the service by a brutal press gang, but is moved to enlist by a laudable desire to serve his country, to see foreign lands, and to perfect himself in mechanical or electrical training, so that when he goes back ashore he can earn bigger wages than ever before. The American blue-jacket is a sober, ambitious young fellow with abundant self-respect and excellent taste in the amusements he seeks. Comparisons are not always pleasing, but I should like to see any five hundred college boys at large in a foreign town who are as courteous, sober, peaceful, and considerate of the rights of others as any five hundred of our blue-jackets on liberty.

New light has been thrown upon the "man overboard" incident on the run down from Trinidad. It appears now that a man was sleeping comfortably on deck when the ship took a lee roll and tossed him in a jolt of main water. With swift present, instinct, though not of mind, the man yelled, "Man overboard!" before he quite woke up. The result afforded an excellent illustration not only of the discipline of our navy, but of the calm intelligence that elaborates long in advance the precise details of what shall be done in every emergency that can possibly occur to ship or fleet. In this case the fleet was at once stopped, the ship concerned and those astern of her lowered boats, the lighted life-boys were dropped, and energetic search was made for the supposedly missing man. It was soon discovered that no man was overboard, and the fleet went on its way.

In the case of a man overboard at night, as this was, the requirements to suit the situation of a number of ships steaming in close formation are necessarily elaborate.

The ship which loses the man turns on a designated letter on the Ardis signal lights and fires one signal gun. All the ships astern of the one losing the man open out the columns such on its own side, so as to leave a wide lane between them in which the boats can look for the man. They also all make the same display on the Ardis and fire the signal gun and all stop. The three nearest ships lower life boats and look for the man.

Preparing to Wash Up after a Day's Immersion in Soot and Coal-dust

A Spirit in Prison*

A Novel

By Robert Hichens

AUTHOR OF "THE GARDEN OF ALLAH," "THE CALL OF THE BLOOD," ETC.

CHAPTER III

"I CAN see the boat, Vere," said Hermione, when the girl came back, her eyes still gleaming with memories of the fun of the cigarette game with Raffo.

"Where, Madré?"
She sat down quickly beside her mother on the window seat, leaning against her confidentially and looking out over the sea. Hermione put her arm round the girl's shoulder.

"There! Don't you see?" She pointed.

"It has passed (C'era Pantano)."

"I see. Yes, that is Gaspare, and Monsieur Emile in the stern. They won't be late for lunch. I almost wish they would, Madré."

"Why?"

"I'm not a bit hungry. Raffo wouldn't eat the dolce, so I did."

"Raffo! You seem to have made great friends with that boy."

She did not speak rebuffingly, but with a sort of tender amusement.

"I really have," returned Vere.

She put her hand against her mother's shoulder.

"Isn't this odd, Madré? Twice in the short time I've known Raffo, he's obeyed me. The first time he was in the boat. I called out to him to drive in, and he did it instantly. The second time he was underwater, at the very bottom of the sea. He looked as if he were dead, and for a minute I felt frightened. So I called out to him to come up, and he came up directly."

"But that only shows that he's a polite boy and does what you wish."

"No, no. He didn't hear me either time. He had no idea I had called. But each time I did, without hearing me he had the sudden wish to do what I wanted. Now, isn't that curious?"

She paused.

"Madré?" she asked.

"You think you influenced him?"

"Don't you think I did?"

"Perhaps so. There's the sympathetic link of youth between you. You are gloriously young, both of you, little daughter. And youth turns naturally to youth, though I'm almost old age doesn't at ways turn naturally to old age."

"What do you know about old age, Madré? You haven't a gray hair."

She spoke with anxious encouragement.

"It's true. My hair declines to get gray."

"I don't believe you'll ever be gray."

"Probably not. But there's another grayness—Life behind one instead of before; the emotional—"

She stopped herself. This was not for Vere.

"They're close in," she said, looking out of the window.

She waved her hand. The big man in the stern of the boat took off his hat in reply and waved his hand, too. The rower palmed with the veneration that comes to men near the end of a task, and the boat shot into the Pool of the Saint, where Raffo was at that moment enjoying his third cigarette.

"I'll run down and meet Monsieur Emile," said Vere.

And she disappeared as swiftly as she had come.

The big man who got out of the boat could not claim Hermione's immunity from gray hairs. His beard was lightly powdered with them, and though much of the still thick hair on his head was brown, and his figure was erect and looked strong and athletic, he seemed what he was—a man of middle age, who had lived and thought and observed much. His eyes had the peculiar expression of eyes that have seen very many and very various sights. It was difficult to imagine them looking surprised, impossible to imagine them not looking keenly intelligent. The vivacity of youth was no longer in them, but the vivacity of intellect, of an intellect almost fiercely alive and tenacious of its life, was never absent from them.

As Artale got out, the boat's prow was being held by the Sicilian, Gaspare, now a man of thirty-five, but still young-looking. Many Sicilians grow old quickly—hard life wears them out. But Gaspare's fate had been easier than that of most of his contemporaries and friends of Morrebiano. Ever since the tragic death of the beloved master, when he still always spoke of as "mio padrone," he had been Hermione's faithful attendant and devoted friend.

Yes, she knew him to be that—she would him to be that. Their stations in life might be different, but they had come to mirror together. They had suffered together and been in sympathy while

they suffered. He had loved what she had loved, lost it when she had lost it, wept for it when she had wept.

And he had been with her when she had waited for the coming of the child.

Hermione really cared for three people; Gaspare was one of them. He knew it. The other two were Vere and Emile Artale.

"Vere," said Artale, taking her two hands closely in his large hands and gazing into her face with the kind, even affectionate directness that she loved in him, "do you know that to-day you are looking insolent?"

"Insolent!" said the girl. "How dare you!"

She tried to take her hands away.

"Insolently young," he said, keeping them authoritatively.

"But I am young. What do you mean, Monsieur Emile?"

"It? It is your meaning I am searching for."

"I shouldn't let you find it. You are much too curious about people. But—I've been having a game this morning."

"A game? Who was your playmate?"

"Never mind."

But her bright eyes went for the fraction of a second to Raffo, who close by in the boat was lying at his ease, his head thrown back, and one of the cigarettes between his lips.

"What! That boy there?"

"Nonsense! Come along! Madré has been sitting at the window for ages looking after for the boat. Couldn't you sail at all, Gaspare?"

Artale had let go her hands, and now she turned to the Sicilian.

"To Naples, signorina, and nearly to the Antio Giuseppe coming back."

"But we had to do a lot of tacking," said Artale. "Mio Dio! That boy is smoking one of my cigarettes! You sacrilegious little creature! He has been rubbing my box!"

Gaspare's eyes followed Artale's to Raffo, who was watching them intently, but who now looked suddenly sleepy.

"It belongs to Madré?"

"It was bought for me."

"I like you better with a pipe. You are too big for cigarettes. And besides, artists always smoke pipes."

"Allow me to forget that I try to be an artist when I come to the island, Vere."

"Yes, yes, I will," she said, with a pretty air of relenting.

"But you think, Vere, you are a king in Naples, and we all treat you quite familiarly. I'll even go first, regardless of etiquette."

And she went off to the steps that led upward to the house.

Artale followed her. As he went he said to Raffo in the Neapolitan dialect:

"It's a good cigarette, isn't it? You are in luck this morning."

"Si, signore," said the boy, smiling. "The signorina gave me ten."

And he blew out a happy cloud.

There was something in his welcoming readiness of response something in his look and voice, that seemed to stir within the tenacious mind of Artale a quivering chord of memory.

"I wonder if I have spoken to that boy in Naples?" he thought, as he mounted the steps behind Vere.

Hermione sat him at the door of her room, and they went in almost directly to lunch with Vere. When the meal was over Vere disappeared, without saying why, and Hermione and Artale returned to Hermione's room to have coffee. By this time the day was absolutely windless, the sky had become nearly white, and the sea was a pale gray, flecked here and there with patches of white.

"This is like a June day of seclusion," said Artale, as he lit his pipe with the air of a man thoughtfully at home. "I wonder if it will succeed in affecting Vere's spirits. This morning, when I arrived, she looked wildly young. But the day had still some blue tints."

Hermione was settling herself slowly in a low chair near the window that faced Capri. The curious, rather ghostly light from the sea fell over her.

"Vere is very sensitive to almost all influences," she said.

"You know that, Emile."

"Yes," he said, throwing away the match he had been using; "and the influence of this morning roused her to pay. What was it?"

"She was very excited watching a diver for *frutti di mare*."

"A few about seven or eight, black hair, Arab eyes, bronze skin, a smile delicate in outline, and a figure almost as perfect as a Nubian's, but rather squarer about the shoulders?"

"You have seen him, then?"

"Smoking ten of my special Khall Targa cigarettes, with his

have been cocked up, and one hand dropping into the Saint's Pool." Hermione smiled.

"My earrings! They're common property here," she said. "That boy can't be a pure-bred Neapolitan, surely. And yet he speaks the language. There's no mistaking the blow he gives to the last syllable of a sentence."

"He's a Sicilian, Vere says."

"Pure bred?"

"I don't know."

"I fancy I must have run across him somewhere in or about Naples. It is he who made Vere, as I told her, look so insolently young this morning."

"Ah, you noticed! I, too, thought I had never seen her so full of the inner spirit of youth—almost as he was in Sicily."

"Yes," Artoria said, gravely. "In some things she is very much his daughter."

"In some things only!" asked Hermione.

"Don't you think not? Don't you think she has much of you in her also? I do."

"Has she? I don't know that I see it. I don't know that I want to see it. I always look for him in Vere. You see, I dreamed of having a boy. Vere is instead of the boy I dreamed of, the boy—who never came, who will never come."

"My friend," said Artoria, very seriously and gently, "are you still allowing your mind to dwell upon that old imagination? And with Vere before you, can you regard her merely as a substitute, an understudy?"

An energy that was not free from passion suddenly flamed up in Hermione.

"I love Vere," she said. "She is very close to me. She knows it. She does not doubt me or my love."

"But," he quietly persisted, "you will allow your mind to run ungoverned among those dangerous ways of the past?"

"Emile," she said, still speaking with reluctance, "it may be very easy to a strong man like you to direct his thoughts, to keep them out of one path and guide them along another. It may be—I don't know whether it is; but I don't pretend to such strength. I don't believe it is ever given to women. Perhaps even strength has its sex—I sometimes think so. I have my strength, believe me. But don't require of me the peculiar strength that is male."

"The truth is that you live living in the past as the Bedouin loves living in the desert."

"It was my oasis," she answered, simply.

"And all these years—they have made no difference?"

"Did you think they would? Did you think they had?"

"I hoped so. I thought—I had begun to think that you lived again in Vere."

"Emile, you can always stand the truth, can't you? Don't say you can't. That would hurt me horribly. Perhaps you do not know how sometimes I mentally lean on you. And I like to feel that if you knew the absolute truth of me you would still look upon me with the same kind, understanding eyes as now. Perhaps no one else would. Would you, do you think?"

"I hope and believe I could," he said. "You do not live in Vere. Is that it?"

"I know it is considered the right, the perfectly natural thing that a mother, stricken as I have been, should find in time perfect peace and contentment in her child. Even you—your spoke of 'living again.' It's the unexpressed phrase, Emile, isn't it? I ought to be living again in Vere. Well, I'm not doing that. With my nature I could never do that. Is that horrible?"

"Ma pauvre amie!" he said.

He bent down and touched her hand.

"I don't know," she said, more calmly, as if relieved, but still with an undercurrent of passion, "whether I could ever live again to the life of another. But if I did it would be in the life of a man. I am not made to live in a woman's life, really to live, giving out the force that is in me. I know I'm a middle-aged woman—to the Italian here more than that, an old woman. But I'm not a finished woman, and I never shall be till I die. Vere is my child. I love her tenderly; more than that—passionately. She has always been close to me, as you know. But no, Emile, my relation to Vere, hers to me, does not satisfy all my need of

love, my power to love. No, no, it doesn't. There's something in me that wants more, much more than that. There's something in me that—I think only a son of his could have satisfied my yearning. A son might have been Maurice some back to me, come back in a different, beautiful, wonderfully pure relation. I prayed for a son. I needed a son. Don't misunderstand me, Emile: in a way a son could never have been so close to me as Vere is,—but I could have lived in him as I can never live in Vere. I could have lived in him almost as once I lived in Maurice. And today!"

She got up suddenly from her chair, put her arms on the window-frame, and looked out to the strange, white day.

"Emile," she said, in a moment, turning round to him, "I want to get away, as to the sea. Will you row me out, into the Grotto of Virgil? It's so dreadfully white here, white and ghastly. I can't talk naturally here, and I should like to go on a little farther, now I've begun. It would do me good to make a clean breast of it, dear brother confessor. Shall we take the little boat and go?"

"Of course," he said.

"I'll get a boat."

She was away for two or three minutes. During that time Artoria stood by the window that looked towards Ischia. The stillness of the day was intense, and gave to his mind a sensation of dream. Far off across the gray and white waters, partially muffled in the clouds that almost resembled mist, the mountains of Ischia were rather suggested, mysteriously indicated, than clearly seen. The gray cliffs towards Ragnoli went down into motionless water gray as they were, but of a different, more pathetic shade.

There was a luminous whiteness in the sky that affected the eyes, as snow does.

Artoria, as he looked, thought this world looked very old, a world arranged for the elderly to dwell in. Was it not, therefore, an appropriate setting for him and for Hermione? As this idea came into his mind it sent a rather bitter smile to his lips, and Hermione, coming in just then, saw the smile and said:

"What is it, Emile? Why are you smiling?"

"Perhaps I will tell you what we are on the sea," he answered.

He looked at her. She had on a black hat, over which a white veil was fastened. It was tied beneath her chin, and hung down in a cloud over her breast. It made him think of the strange misty clouds which brooded about the breasts of the mountains of Ischia.

"Shall we go?" she asked.

"Yes. What is Vere doing?"

"She is in her room."

"What is she doing there?"

"Reading, I suppose. She often shuts herself up. She has been reading almost more than I do."

"Well?"

Hermione led the way downstairs. When they were outside, on the crest of the inlet, the peculiar sickness of the weather struck them both more forcibly.

"This is the strangest sickness effect I think I have ever seen," said Artoria. "It is as if nature were under the influence of a drug, and had fallen into a morbid dream, with eyes wide open, and pale, inert, and folded hands. I should like to see Naples to-day, and notice if this weather has no effect upon that amazing population. I wonder if my young friend, Maurice, knows the fanciful—By the way, I haven't told you about him!"

"No."

"I would. But not now. We will continue our former conversation. Where shall we find the boat, the small one?"

"Gaspere will bring it. Gaspere! Gaspere!"

"Gaspere!" cried a strong voice below.

"La piccola barca!"

"Va, bene, signora!"

They descended slowly. It would have been almost impossible to do anything quickly on such a day. The smallest movement, indeed, seemed almost an outrage, likely to disturb the great white dreamer of the sea. When they reached the foot of the cliff face was there, holding the little craft in which Vere had gone out with Ruffo.

* The grotto described in this book is not really the grotto of Virgil, but it is often called so by the fishermen along the coast.

"There is something within one which rises up and defies a lie"

"Do you want me, signora?"
 "No, thank you, Gaspare. Don Emilio will see me. We are only going a very little way."

She stepped in. An Artois followed her he said to Gaspare:

"These fishermen have gone?"

"Five minutes ago, signora. There they are!"

He pointed to a boat at some distance, moving slowly in the direction of Posillipo.

"I have been talking with them. One says he is of my country, a Sicilian."

"The boy?"

"Si, signora, the giovinotto. But he cannot speak Sicilian, and he is never seen in Sicily, probably."

Gaspare spoke with an accent of pity in which there was almost a hint of contempt.

"A riverdell, signora," he added, pushing off the little boat.

"A riverdell, Gaspare."

Artois took the oars and paddled very gently out, keeping near to the cliffs of the opposite shore.

"Even San Francesco looks weary to-day," he said, glancing across the pool at the Salute on his pedestal. "I should not be surprised if, when we return, we find that he has laid down his cross and is reclining like the tired fishermen who come here in the night. Where shall we go?"

"To the Grotto of Virgil."

"I wonder if Virgil was ever in his grotto? I wonder if he ever came here on such a day of adversity as this, and felt that the world was very old, and he was even older than the world?"

"Do you feel like that to-day?"

"I feel that this is a world suitable for the old, for those who have white hair to contrast with the white waters, and whose nights are the white nights of age."

"Was that why you were smiling so strangely just now when I came in?"

"Yes."

He rowed on softly. The boat slipped out of the Pool of the Salute, and then they saw the Cape Coroglio and the Island of Nisida with its fort. On their right, and close to them, rose the weary-looking cliffs, honeycombed with caverns, and seamed with fissures as an old and haggard face is seamed with the wrinkles that tell of many cares.

"Here is the grotto," said Hermione, almost directly. "How in gently."

He obeyed her and turned the boat, sending it in under the mighty roof of rock.

A darkness fell upon them. They had a safe, enclosed sensation in escaping for a moment from the white day, almost as if they had escaped from the white enemy.

Artois let the oars lie still in the water, keeping his hands lightly upon them, and both Hermione and he were silent for a few minutes, listening to the tiny sounds made now and then by drops of moisture which fell from the cavern roof softly into the almost silent sea. At last Artois said:

"You are out of the wilderness now. This is a shadowed place like a professional, where murmuring lips tell to strengthen the stories of their lives. I am not a stranger, but tell me, my friend, about yourself and Vere. Perhaps you secretly know how deeply the mother and child problem interests me—that is, when another and child are two real forces, as you and Vere are."

"Then you think Vere has force?"

"Do not you?"

"What kind of force?"

"You mean physical, intellectual, or moral? Suppose I say she has the force of charm?"

"Indeed she has that, as he said. That is one of the attributes she derives from Maurice."

"Yes. He had a wonderful charm. And then, Vere has passion."

"You think so?"

"I am sure of it. Where does she get that from?"

"He was full of the passion of the south."

"I think Vere has a touch of southern passion in her, too, considering, perhaps, with the other. And that, I think, she derives from you. Then I discern in Vere intellectual force, immature, embryonic, if you like, but unmistakable."

"That does not come from Hermione," Hermione said, suddenly, almost with bitterness.

"Why—why will you be unnecessarily hampered?" Artois exclaimed.

His voice was confusedly rebuffed by the caverns, which broke into faint, but deep mutterings. Hermione looked up quickly to the mysterious vault which brooded above them, and listened till the chaotic noises died away. Then she said:

"Do you know what they remind me of?"

"Of what?"

"My efforts. These efforts I made long ago to live again in work."

"When you wrote?"

"Yes, when I tried to throw my mind and my heart down upon paper. How strange it was! I had Vere—but she wasn't enough to fill the air. And I knew what work, on he said a conviction, because I knew you. And I stretched out my hands to it—I stretched out my soul. And it was no use; I wasn't made to be a successful writer. When I spoke from my heart to try and move men and save myself, my words were heard, as yours were just now by the rock—silenced, and broken, and flung back in confusion. They struck me with like force. Finally, I am one of those people who can only do one thing: I can only feel."

"It is true that you could never be an artist. Perhaps you were made to be an inspiration."

"But that's not enough. The rôle of starter to those who race—I haven't the temperament to reconcile myself to that. It's not that I have in me a conceit which demands to be fed. But I have in me a force that demands to exercise itself. Only when I was living on Monte Amato with Maurice did I feel that that force was being used as God meant it to be used."

"In loving?"

"In loving passionately something that was utterly worthy to be loved."

Artois was silent. He knew Hermione's mistake. He knew what had never been told him: that Maurice had been false to her for the love of the present girl Maddalena. He knew that Maurice had been untrue to death by the betrayed girl's father, Salvatore. And Gaspare knew those things, too. But through all these years these two men had no respect of silence, the nobility of it, the grand severity of it in certain circumstances of life, that they had never spoken to each other of the black truth known to them both. Indeed, Artois believed that even now, after more than sixteen years, if he ventured one word against the dead man Gaspare would be ready to fly at his throat in defence of the loved passion. For this divined and persistent loyalty Artois had a sensation of absolute love. Between him and Gaspare there must always be the barrier of a great and mutual reserve. Yet that very reserve, because there was something truly delicate and truly noble in it, was as a link of steel between them. They were satellites of Hermione. They had been watchdogs through all these years, guarding her from the knowledge of a truth. And so well had they done her service that now to-day she was able to say, with clasped hands and the light of passion in her eyes:

"Something that was utterly worthy to be loved."

When Artois spoke again he said:

"And that force cannot be fully used in loving Vere?"

"No, Emile. Is that very horrible, very unnatural?"

"Why should it be?"

"I have tried—I have tried for years, Emile, to make Vere enough. I have even been false with myself. I have said to myself that she was enough. I did that after I knew that I could never produce work of any value. When Vere was a baby I lived only for her. Again, when she was beginning to grow up, I tried to live, I did live only for her. And I remember I used to say, I kept on saying to myself, 'This is enough for me. I do not need any more than this. I have had my life. I am now a middle-aged woman.' I must live in my child. This will be my satisfaction. This is my satisfaction. This is my right and naturally all that force I feel within me. I kept on saying this. But there is something within me which rises up and defies a lie—however beautiful the lie is, however noble it is. And I think even a lie can sometimes be both. Don't you, Emile?"

"It almost seemed to him on a moment that she knew his lie and Gaspare's."

"Yes," he said. "I do think so."

"Well, that lie of mine—it was defied. And it had no more resource."

"I want you to tell me something," he said, quietly. "I want you to tell me what has happened to-day?"

"To-day?"

"Yes. Something has happened either to-day or very recently—I am sure of it—that has stirred up within you this feeling of acute dissatisfaction. It was always there, but something has called it into the open. What has done that?"

Hermione hesitated.

"Perhaps you don't know," he said.

"I was wondering—yes, I do know. I must be truthful with myself—with you. I do know. But it seems so strange, so almost inexplicable, and even rather absurd."

"Truth often seems absurd."

"It was that too, that *diver for frutti di mare*—Ruffo."

"The boy with the Arab eyes?"

"Yes. Of course I have seen many boys full of life and gaiety and music. There are so many in Italy. But—well, I don't know—perhaps it was partly Vere."

He was silent.

"Vere was so interested in him. It may have been that. Or perhaps it was something in his look and in his voice when he was singing. I don't really know what it was. But that boy made me feel—more horribly than I have ever felt before—that Vere is not enough. Emile, there is some hunger, no persistent, so peculiar, so intense, that one feels as if it must be satisfied eventually, as if it were impossible for it not to be satisfied. I think the human hunger for immortal life is like that, and I think my hunger for a son is like that. I know my hunger can never be satisfied. And yet it lives on in me just as if it knew more than I know, as if it knew that it could and must. After all these years I can't, no, I can't reconcile myself to the fact that Maurice was taken from me so utterly, that he died without snugging himself upon a son. It seems as if it couldn't be. And I feel to-day that I cannot bear that it is."

There were tears standing in her eyes. She had spoken with a force of feeling, with a depth of sincerity, that startled Artois, intimately as he knew her. Till this moment he had not quite realized the wonderful persistence of love in the hearts of certain women, and not only the persistence of love's existence, but of its existence undiminished, unaltered in time.

"How can I to bear it?" she said, as he did not speak.

"I cannot tell. I am not worthy to know. And besides, I must—"

"as you say that one of the greatest miseries of human existence is life, at any rate to me, is this: how some human beings do bear the burdens laid upon them. Christ bear His cross. But there

Music and the Opera

CONCERNING AN EPOCH-MAKING SCORE

By LAWRENCE GILMAN

HERE will always be persons for whom such a play as Maeterlinck's "Pelléas et Mélisande" will seem to be, for the most part, vain, affected, and pretentious. They are sincere in their dislike, those forthright and excellent people, and they are to be commiserated, for they are, in such a region of the imagination as this drama builds up about them, alien in a world whose ways and whose wonders must be forever hidden from their most determined scrutiny. Such robust and worldly spirits writes a thoughtful contemporary essayist, "that swim so vigorously on the surface of things," have always "a suspicion, a jealousy, a contempt, for one who dives deeper and brings back tidings of the strange secrets that the depth holds"; they will not even grant that the depths are anything save murky, that the tidings have validity or importance. They take comfort in their superb aloofness, those confident spirits, and speak of themselves, with mock humility, as "plain, blunt persons," for whom the alleged vanities of such an order of art are comfortably negligible. Ah, well it is, after all, as Maeterlinck's *Pelléas* itself so much for mirth as for lament; yet even more is it a matter for resignation. There will always be, as has been observed, an immense and confident majority for whom that territory of the creative imagination which lies over the boundaries of the palpable and vivid world will seem more than delusive: who will always and sincerely give their faith to that which is definite and concrete, patent and direct, and who must in all honesty condemn that which is undeclared, allusive, enigmatic: which communicates itself through echoes and in

Mr. Cleofonte Campanini
CONDUCTOR AT THE MANHATTAN
OPERA HOUSE, UNDER WHOSE
MUSICAL DIRECTION "PELLÉAS ET
MELISANDE" WAS PERFORMED

glimpes; by means of intimations, signs, and tokens. For them it would be of no avail to point to the dictum of one who, like Maeterlinck, is aware of remote voices and strange dreams: "Dramatic art," he has wisely said, "is a method of expression, and neither a halfhearted escape nor a love affair more befitting than the passionate exposition of the most delicate and strange intuitions; and the dramatist is as free as the painter of good pictures and the writer of good books. All art is passionate, but a flame is not the less flame because we change the candle for a lamp or the lamp for a fire; and all flame is beautiful."

It is a dictum that is scarcely calculated to persuade a very general audience: a "passionate exposition of the most delicate and strange intuitions" is not precisely the kind of aesthetic fare which the "plain, blunt man," glorying in his plainness and his bluntness, is apt to relish. It is a point upon which it is perhaps needless to dwell; but its recognition serves as explanation of the fact that the music-drama into which Debussy has transformed Maeterlinck's play should have met with the kind of reception which it has at the hands of those who, in this portion of the country, are entrusted with the public appraising of new music. For in the musical setting of Debussy, Maeterlinck's drama has found its precise equivalent: the qualities of the music are the qualities of the play, completely and exactly; and, sharing its qualities, it has evoked and will always evoke the more or less contemptuous antagonism of those for whom it has little or nothing to say. Yet certain deliberations which have been made concerning it invite comment even from those who hold no brief for the composer or his works. In discussing, with necessary brevity, Debussy's remarkable music-drama in this place a fortnight ago, it was said that its production by Mr. Hammerstein at the Manhattan Opera House constituted the most important event in New York's operatic history since the first performance here of "Tristan und Isolde" more than a score of years ago; and the repeated and their-admirable performances of the opera which have occurred at the Manhattan since then have strengthened this conviction. For a further consideration of a few of its aspects (again necessarily brief) there is, therefore, ample warrant.

It has been amazingly said that Debussy's music contrIBUTES little to the play; that it "in no way betters or intensifies the moods of the drama"—an assertion which is scarcely worthy of attention save as a provocation of the comment, which is made with deliberation, that this lyric drama of Debussy's is unrivalled in music-dramatic art for the exquisite justness with which it enforces the moods and action of the play. It is true that the music never seduces the attention of the auditor from the essential concerns of the drama itself; never, as does the music of Wagner, tyrannically and superbly absorb the mind. Always in this music-amped music-drama there is maintained, as to emphasis and intensity, a scrupulous balance between the movement of the drama and the total undercurrent which reflects it; the music is absolutely merged in the drama, suffusing it, coloring it, but never dominating or transcending it. It is, for this reason, a true music-drama—a work far more faithful in Wagner's avowed principles than his are his own magnificently inconsistent scores. In this music there is no excess of gesture, there is none of Wagner's gorgeously expansive rhetoric; the "Je t'aime," "Je t'aime aussi" of Debussy's lovers are expressed with a simplicity and a stark directness which could not well go further; and it is a curious and eloquent fact that the moment of their profoundest ecstasy, though it is artfully and eloquently prepared, is represented in the orchestra by a blank measure, a moment of absolute silence. This, indeed, is almost the supreme distinction of Debussy's music-drama: that it should be at once so eloquent and so simple, an exposition of its subject-matter so rich and intense yet so delicately and scrupulously reticent. After the grave speech and simple gestures of these naive yet subtle and passionate tragedians, as Debussy has translated them into fluid tone, the postures and the rhetoric of Wagner's splendid personages seem, for a time, violently extravagant, excessive, and overwrought. To attempt to resist the imperious sway which the most superb of musical romantics must always exert over his kingdom would be a futile endeavor; yet it cannot be denied that for some the method of Debussy as a musical dramatist will seem the more viable and the more sound, as it is grateful to the mind a little wearied by the drums and trappings of Wagnerian conquest.

It has been alleged that Debussy's score is devoid of melody, and that the music exhibits in that lack a palpable weakness. Of course the matter depends upon what one means by "melody." This music is rife with melody. It does not, of course, reside in the voice parts, for there Debussy has deliberately and wisely avoided formal melodic design. It is to be found in the orchestra—an orchestra which, while it shimmers and glimmers with iridescent harmonic hues, is yet richly and pervasively melodic. But it is Debussy's melody—it is Debussy's melody—to expect to find in this score the melodic flood of Verdi, of Wagner, of Gounod, of Massenet, of Puccini; his melodic forms are his own, and they often baffle impatient ears by reason of their seeming incoherence, their seeming waywardness, their vague and shifting and evanescent contours.

It has been said that in this score Debussy is not always at his best, and the comment is justified. There are passages, most of them to be found in the interludes connecting the earlier scenes (which, it is well known, were extended to meet a mechanical exigency), wherein the fine and rare gold of Debussy's thought is intermixed with the dross of alien ideas. But elsewhere—almost, in fact, continuously—the music is superlative in its copiousness and originality of inspiration. It contains page upon page of melodic, of almost insupportable beauty, a beauty that is utterly individual in impulse. No music written for the stage since the death of Wagner a quarter of a century ago is comparable to this. It is a masterpiece which even the author of "Tristan," an venture to conceive, would not have been ashamed to sign, though his thought moved in other regions and courts other apices.

DRAWN BY HOWARD E. SMITH

The Season's Plays

CRANE, GOODWIN, AND A LADY FROM RUSSIA

By "I"

Mr. William H. Crane, to Miss Margaret Dale, and to Mr. George Ade, New York should feel indebted indeed for the delightful comedy they have provided in "Father and the Boys" at the Esquire Theatre. For distinctness of characterization, the play is quite the equal of "The College Widow"; in humor, also, it is the peer of the earlier work. And in one moment of its action it pauses, and only for an instant, in its merriest for a bit of seriousness which is poignantly charming. The simplicity, the genuineness of this moment is admirable. But of this, later.

In a play from Mr. Ade's hand one has come to look quite confidently for what the West designates as "breifness," and here one unexpectedly finds it. One finds, also, as in nearly everything to which Mr. Ade has turned his hand, the most generous and frank assault upon the modes and manners of one's fellow creatures. All of this is done with a sprightfulness of insight which has already made near-classics of the Ade Fables.

If Mr. Crane had been measured for a play by the Bertillon system he could not have been provided with one better fitted in his talents. His has long been a recognized ability to arouse the mirth or the sympathies of an audience, and in "Father and the Boys" he does this as only Mr. Crane can do it. Miss Dale deserves much praise for the easy way in which she has relinquished her staidness and come down to the real humanities. In this play she is fresh and blood and real, in addition to being an extremely pretty, graceful woman.

Mr. Ade's play portrays the regret of a hard-working old millionaire over the inclination—rather the disinclination—of his two sons. He has worked for years like a Turk, and grown a fortune in the wood business, taking his sons into partnership to make something of them to fit them to succeed him, only to discover their utter naughtiness. William, the elder son, is, as Mr. Ade would say, "leg-home" on athletics, while Thomas, the second son, toils not, neither does he spin, caring for nothing save "going over the jumps" with Mrs. Bruce Goodford, the "whole thing" in society. The boys go about their affairs with a blithe disregard of their sincere parent, Leonard Morewood (Mr. Crane), leaving him to trade in wool or any other old thing. Then someone puts the old party wise to himself, urging him to shake the holiness of sheep from his belly, and catch up with the procession. This Father eventually does, and by the time he pauses to take a deep breath the procession is miles behind, struggling through the dust Father has created.

In his efforts he is delightfully aided by one Rosie Benton (Miss Dale), a Western product, gay as a bird, who has come East to make a living as a "garbor entertainer"; in her own words, "to do stunts for so much per in the drawing-rooms of the board rich." Incidentally, Father goes out to Nevada with her on an irreproachable journey, which makes her with a sweetheart she had believed dead, and secures to her her share in a mine. Needless to say, the journey throws no end of a fright into the boys, who follow footstep. There comes the understanding, and the end of a charming four-act comedy.

The touching moment in the play, when the audience stills its laughter and sits as quiet as mice in church, comes when the "society" son, Thomas, asks his father for a check with which to pay his bride's losses of the night before. Leonard Morewood requests the amount, and with little embarrassment the youth re-

plies that it is one thousand dollars, adding, "They play a stiff game there, you know." Old Morewood takes the check, which alone lacks his signature, having been made out by the young man, and says, in effect:

"I intend to give you the money, but before I sign this I want to tell you something. When I first came to this city you and your brother were little lads. I worked and struggled on—and your mother did all the housework. In that first year I managed to lay aside—one thousand dollars. Remember that—one year; one thousand dollars."

Then he signs the check, and lays it in his son's hand.

There are not the words of the old man, perhaps, but they may convey their spirit, and the spirit is what tugs for an instant at every heart in the house.

It is a pity that the rôles of the elder son and the younger son are not better done by Mr. Forrest Orr and Mr. Robert MacKay, because they might have added much to the play, but as one's interest centres in Miss Dale and Mr. Crane one is not too kindly conscious of neighboring shortcomings. "Father and the Boys" is a play to one with a grain of humor in him should miss.

I came away from Madame Komisarjevskaya's representation of "The Fire of St. John" (which has been seen in New York before) feeling that I had been watching not so much a strong piece of realism, as a piece of reality, and a vivid, grievous, heart-breaking reality at that. The setting was plain; the dresses were commonplace, even uncouth; there was little of the element of charm, whether for eye or ear; the persons concerned were unattractive. And without there were glooms and flashes of genius; there was an extraordinary, even painful sense of the reality of this dull-colored, low-pitched tragedy in Russian Lithuania. It was the old tale of one man and two women; lost by both, and in a way loving both; and then the passion, the burning desire, the final reconciliation of one of the women, whose tragedy was the greater, because she was a nameless waitress, the child of an outcast woman, whose drunkenness and dishonesty had brought her to the depths.

It would seem that this Russian company might have a better chance of success if they stuck to genuine Russian plays, of which there are no lack, instead of playing Russian translations of German or Norwegian. If they adhered to genuine Russian theater, they would have all the psychic atmosphere of their nation to back them up, and if they chose wisely, they could also count on a public already knowing the story they presented. Perhaps a good acting version of "Anna Karenina" might prove a winning card, and Madame Komisarjevskaya has just the qualities of strong emotionalism that the character of Anna calls for. Let Russians present Russia to us, and we shall be far more genuinely interested.

"The Easterner," by George Broadhurst, recently produced at the Garrick Theatre, is a four-act play of California life. The dialogue is amusing, and though this may seem incredible, some of the situations have an atmosphere of novelty; but I went away without any clear conception where the centre of interest was supposed to lie. At first it appeared to concern the marriage of Sam Jakowski with Doris, the beautiful albino daughter of the Russian, sheriff; but Sam was snuffed out by a pistol shot before Art Orr had closed, and a posse went off in hot pursuit of Bruce Morton, the lover of Doris's sister Janet, who was wrongly sup-

Mr. Crane and Miss Dale in Mr. Ade's new Comedy, "Father and the Boys"

posed to have done the deed. By this time two more characters had developed—John Harlow, the Easterner who was the financial patron of the settlement, and Grace Morton, the sister of Bruce. John Harlow, who had been made deputy sheriff by Robbins, succeeds apparently to the sheriff's office when Robbins resigns in order to head the posse which is to avenge his son-in-law's murder, and Harlow takes up the rôle of Bruce's protector.

Now, as most of the audience guessed, the real murderer was not Bruce Morton at all, but a sung, villainous scoundrel bearing the name of Morley Crawford. Crawford had previously been the lover of the beautiful albino daughter, Ann Johnson, lentured of this and thereupon went punning for Crawford, who, very excusably, shot first and killed him. How Bruce Morton is trailed to the mountain cabin, how John Harlow pleads in vain for his life with the relentless Robbins, finally, how, with a word, the beautiful albino daughter points out the guilty Crawford—all this may be witnessed in the third (and best) act of the play. The fourth act is mainly a marrying act. Everybody marries everybody else, except the albino, who is, we learn, recuperating at her aunt's, and the purser, who is, we suppose, wedded to his duties.

The play is interesting, unreal, and unconvincing, but the acting is excellent. Nat Goodwin as John Harlow precisely fills his rôle; Nell O'Brien as the Robbins is admirable; Bud Woodthorpe is effective as Lee Kung, the Chinese domestic; and as *Sierra Rider*, the housekeeper, Miss Lucile Le Verne was excellent. Miss Edna Goodrich as Grace Morton handles adroitly a difficult and more or less impossible part.

A Lady's Limit

"How long did the fight with your husband last?"

"About ten minutes, yer honor. Nature no lady would keep it at any longer."

And There Was Light

ESQ.'s mother, wishing to keep him in bed for a slight cold, thought by darkening the windows to convince the young man that it was still night, and so closed tightly the inside blinds. All was thus dark except the small, round holes where the adjusting rod of the blinds worked.

"See," said mother, "it is dark, dark; he still, now, and sleep until it is light."

"Mamma," queried a voice from the cot presently—"mamma, look at the window: the dark has got holes in it."

And soft he gets!

The Wizard

SOME years ago an expedition from the University of Pennsylvania was sent to one of our Southern States for the purpose of observing a solar eclipse.

The day before the event one of the professors said to an old rick belonging to the household wherein the scientist was quartered:

"Now, if you will watch your chickens tomorrow morning you'll find that they'll all go to roost at eleven o'clock."

"You was, of course, mistaken; but at the appointed hour the heavens were darkened, and the chickens retired to roost. At this the negro's amazement showed no bounds, and he sought out the scientist.

"Professor," said he, "how long ago did you know dem chickens would go to roost?"

"About n year ago," said the professor, smilingly.

"Well, ef dat don't beat all!" was the darky's comment. "Perfesser, a year ago dem chickens we'n't even hatched!"

A SPIRIT IN PRISON

(Continued from page 24.)

has only been, since the beginning of things, one Christ, and it is unthinkable that there can ever be another. But all those who are not Christ, how is it they bear what they do bear? It is easy to talk of bravery, the necessity for it in life. It is always very easy to talk. The thing that is impossible is to understand. How can you come to me to help you, my friend? And suppose I were to try. How could I try, except by saying that I think Verre is very worthy to be loved with all your love?"

"You love Verre, don't you, Emile?"

"Yes."

"And I do. You don't doubt that?"

"Never."

"After all I have said, the way I have spoken, you might."

"I do not doubt it for a moment."

"I wonder if there is any mother who would not, if I spoke to her as I have spoken to you to-day?"

"I think there is a great deal of untruth spoken of mother's love, a great deal of misconception about it, as there is about most very strange and very wonderful and beautiful things. But are you so sure that if your husband had stamped himself upon a lay like Verre within you could have been satisfied?"

"I have believed so."

She was silent. Then she added, quietly, "I do believe so."

He did not speak, but sat looking down at the sea, which was full of dim color in the cave.

"I think you are doubting that it would have been so?" she said at last.

"Yes, that is true. I am doubting."

"I wonder why?"

"I cannot help feeling that there is passion in you, much passion as could not be satisfied in any strict maternal relationship."

"But I am old, dear Emile," she said, very simply.

"When I was standing by that window, looking at the mountains of Sicily, I was saying to myself, 'This is an old, tired world, suitable for me—and for you. We are in our right environment to-day.' I was saying that, Hermione, but was I believing it, really? I don't think I was. And I am ten years older than you, and I have been given a nature that was, I think, always older than yours could ever be."

"I wonder if that is so?"

She looked at him very directly, even searchingly, not with eager curiosity, but with deep inquiry.

"You know, Emile," she added, "I tell you very much, but you tell me very little. Not that I wish to ask anything—no, I respect all your reserve. And about your work; you tell me all that. It is a great thing in my life, your work. Perhaps you don't realize how sometimes I lie in the back that you are doing, almost as if I were writing it myself. But your inner life—"

"But I have been frankness itself with you," said Artois. "To me no one has ever said so much as to you."

"Yes, I know, about many things. But about emotion, love,—not friendship, the other love—do you get on without that? When you say your nature has always been older than mine, do you mean that it has always been harder to move by love, that it has had less need of love?"

"I think so. For many years in my life I think that work has filled the place love occupies in mine, perhaps in most men's lives. Everything comes around to work. I know that, because if any one attempts to interfere with my work, or to interrupt any of the time that should be given to it, my regard I may have for that person turns at once to irritation, almost to hatred."

"I have never done that?"

"You—no. Of course, I have been like other men. When I was young—well, Hermione, after all I am a Frenchman, and though I am of Normandy, still I passed many years in Paris, as you know."

"All that I understand. But the real thing? Such as I have known?"

"I have never broken my heart for any one, though I have known agitations. But even those were long ago. And since I was thirty-five I have never felt really dominated by any one. Before that time I occasionally passed under the yoke. I believe, like other men. Why do you fix your eyes on me like that?"

"I was wondering if you could ever pass under the yoke again."

"Honestly, I do not think so. I am not sure. When can one be certain that one will never be, or do, this or that? Surely,"—he smiled—"I do not not afraid for me."

"I do not say that. But I think you have forces in you not fully exercised even by your work."

"Possibly. But there the years do really step in and count for something, even for much. There is no doubt that as the years increase, the man who cares at all for intellectual pleasures is able to care for them more, is able to substitute them, without even regret, without waiting and gnashing of teeth, for certain other pleasures, to which, perhaps, formerly he clung. That is why the man who is mentally and bodily—you know what I mean?"

"Yes."

"Has such an immense advantage in years of decline over the man who is merely a bodily man."

"I am sure that is true. But—"

"What is it?"

"The heart? What about that?"

"Perhaps there are some hearts that can fulfil themselves sufficiently in friendship."

As Artois said this his eyes rested upon Hermione with an expression in them that revealed much that he never spoke in words.

She put out her hand, and took his, and pressed it, holding hers over it upon the ear.

"Emile," she said, "sometimes you make me feel unworthy and ungrateful because—because I still need, I dare to need more than I have been given. Without you I don't know how I should have faced it."

"Without me you would never have had to face it."

"That was the cry that rose up perpetually in the heart of Artois, the cry that Hermione must never hear. He said to her now:

"Without you, Hermione, I should be dead in the dust of Africa!"

"Perhaps we each owe something to the other," she said. "It is blessed to have a debt to a friend."

"Would to God that I could pay all my debt to you!" Artois exclaimed.

Again the covers took up his voice, and threw it back to the sea in confused and hollow mutterings. They both looked up, as if some one were above them, warning them or rebuking them. At that instant they had the feeling that they were being watched. But there was only the empty gray sea about them, and over their heads the rugged, weary rock that had braved over the sea for centuries more.

"Hark!" said Artois, "it is telling me that my debt to you can never be paid; only in one way could it be partially discharged. If I could show you a path to happiness, the happiness you long for, and need, the passionate happiness of the heart that is giving where it requires to give—for your happiness must always lie in generosity—I should have partially paid my debt to you. But that is impossible."

"I've made you sad to-day by my complaining," she said, with self-rebuke. "I'm sorry. You didn't realize?"

"How it was with you? No, not quite—I thought you were more at peace than you are."

"Till to-day I believe I was half-decided too."

"That singing boy, that—what is his name?"

"Enrico."

"That Enrico, I should like to run a knife into him under the left shoulder blade. How dare he, a ragamuffin from some hovels of Naples, make you know that you are unhappy?"

"How strange it is that what outside things, or people who have no connection with us or with our lives, can do to us unaccountably!" she said. "I have heard a hundred boys sing on the bay, seen a hundred rowing their boats into the Pool—and just this one touches some chord, and all the strings of my soul quiver."

"Some people act upon us somewhat as nature does sometimes. And Verre paid the boy. There is another irony of unaccountableness. Here, here of your heart, of your flesh, rewards your pain paid. How he has made over to those he has loved and live with most intimately! You, her mother, are a stranger to Verre. Does not to-day prove it?"

"Ah, but Verre is not a stranger to me. That is where the mother has the advantage of the child."

Artois did not make any response to this remark. To cover his silence, perhaps, he groined the cave more firmly and began to back the boat out of the cave. Both felt that it was no longer necessary to stay in this confessional of the rock.

As they came out under the grayness of the sky, Hermione, with a change of tone, said:

"And your friend? The Marchese—what is his name?"

"Isidoro Panarici."

"Tell me about him."

"He is a very perfect type of a complete Neapolitan of his class. He has scarcely travelled at all, except in Italy. Once he has been in Paris, where I met him, and once to Lucerne for a fortnight. Both his father and mother are Neapolitans. He is a charming fellow, utterly unintellectual, but quite clever; shrewd, sharp at reading character, marvelously able to take care of himself, and hold his own with anybody. A cut to fall on his feet! He is apparently torn without any sense of fear, and with a profound belief in destiny. He can drive four-in-hand, swim for any number of hours without tiring, ride—well, as an Italian cavalry officer can ride, and that is not badly. His accomplishments. He can speak French—abominably, and pick out all imaginable tunes on the piano, putting indistinctly quite tolerable voices. I don't think he ever reads anything, except the *Giornale* and the *Mattino*. He doesn't care for politics, and likes cards, but apparently not too much. He craves with him. He knows Naples inside out, and is as frank as a child that has never been punished."

"I should think he must be decidedly attractive?"

"Oh, he is. One great attraction he has—he appears to have no sense at all that difference of age can be a barrier between two men. He is twenty-four, and I am what I am. He is quite unaware that there is any gulf between us. In every way he treats me as if I were twenty-four."

"Is that refreshing or embarrassing?"

"I find it generally refreshing. His family accepts the situation with perfect aloofness. I am welcomed as Doro's chum with all the good-will in the world."

Hermione could not help laughing, and Artois echoed her laugh.

"Merely talking about him has made you look years younger," she declared. "The influence of the day has lifted from you."

"It would not have fallen upon Isidoro, I think. And yet he is full of sentiment. He is a curious instance of a very common Neapolitan obsession."

"What is that?"

(Continued on page 32.)

The Triumph of Daisy

WHEN Daisy was fifteen, she called her father and mother into her dressing room. "Dear papa and mamma," she said, "it is now that we come to an understanding. I desire to select all of my own clothes without any suggestions." Naturally papa laughed at this. Mamma is discreetly silent.

"And," continued Daisy, "I will receive my callers alone."

"I hope," said papa, now growing sober, "that this is all, Daisy dear. You know I have been very fond of you. Indeed, I say so that I am worn out over the struggle to keep you going."

"Too bad about you, papa," said Daisy. "But, no. It's not all. I must go to the attics at least once a week. Then I shall, of course, go next term to a finishing school. I will let you know the name as soon as I decide. After this you must take me to Europe. These are the essentials. There shall also be the matter of my coming out, but that can be arranged later. I merely wish now to give you due notice that I must no longer be hampered."

"Suppose," said Daisy's father, "that we have to consider your modest request, but then?"

Daisy smiled. She was fully aware of her power.

"Then," she repeated, "I shall take pleasure in telling everybody what goes on at home every day."

Realizing that they were up against it, both parents joyfully gave in.

Return with Easter down,
Yet millinery shows no
That every lid is on.

Parisian Dog Doggers

WHILE the police of New York City have been importing dogs for patrol work, the Paris authorities have been training men for racking down dogs.

A tax of eight shillings a year is imposed on every dog, and the owners are supposed to declare them themselves. Many of the owners evade the tax by giving their shillings a year to their couriers. When the local authorities make inquiries the courier denies the existence of the dogs, and the revenue is derelict.

The authorities are now paying \$30 a month to a number of men who can bark. The men walk along the streets at night, bark outside every house, and when a dog replies take note of the address and send word the tax-collector.

Owners of dogs are now attempting to donate them to dodge these dogged dog loggers.

That Held Her

"THE most eloquent speech I ever heard contained only four words," said Sociologist Sigmund. "Ginger Magnanigle had brought his best girl to the Grand Civic Ball of the East Side Gentlemen's Sons Terpsichorean Votive, ticket admitting body and gent, including hat check, fifty cents. The girl, fascinated by a better waltzer, abandoned her escort and danced three times with the stranger. As they were beginning their fourth waltz they were stopped by the hand of Ginger Magnanigle, which clutched the arm of the girl. Glazing deep into her eyes, and with a voice in which were mingled surprise, self-pity, reproach, resentment, and terror, he exclaimed:

"So-a-y, who bring yer?"

PROFESSOR HAECKEL, WHO IS ONE OF THE LEADING ADVOCATES OF THE BIOLOGICAL THEORY OF EVOLUTION, CELEBRATED SEVENTY THE GOLDEN ANNIVERSARY OF HIS DOCTOR'S DEGREE. HE WAS BORN AT POTSDAM IN 1834, AND BECAME PROFESSOR AT JENA IN 1862.

(Continued from page 39.)

"He is entirely obsessed by woman. His life centres round woman. You observe I use the singular. I do that because it is so much more plural than the plural in this case. His life is passed in love affairs, in a sort of chaos of amours."

"How strange that is!"

"You think so, my friend?"

"Yes, I never can understand how human beings can pass from love to love, as many of them do. I never could understand it, even before I—before Emily."

"You are not made to understand such a thing."

"But you do?"

"I? Well, perhaps. But the loves of men are not as your love."

"Yet his was," she answered. "And he was a true southerner, despite his father."

"Yes, he was a true southerner," Artois replied.

For once he was off his guard with her, and uttered his real thought of Maurice, not without a touch of the irony that was characteristic of him.

Immediately he had spoken he was aware of his indiscretion. But Hermione had not noticed it. He saw by her eyes that she was far away in Sicily. And when the boat slipped into the Saint's Pool, and Gaspare came to the water's edge to hold the prow while they got out, she rose from her seat slowly, and aimed, reluctantly, like one disturbed in a dream that she would fain continue.

"Have you seen the signorina, Gaspare?" she asked him.

"Has she been out?"

"No, signora. She is still in the house."

"Still reading?" said Artois. "Vere must be quite a book-worm!"

"Will you stay to dinner, Emile?"

"Alas, I have promised the Marchesine to dine with him. Give me a cup of tea à la Rasse, and one of Ruffo's cigarettes, and then I must bid you adieu. I'll take the boat to the Artico Gioseppar, and then get another there as far as the gardens."

"One of Ruffo's cigarettes!" Hermione refused, as they went up the steps. "That boy seems to have made himself one of the family already."

"Yet, I wish, as I said in the cave, that I had put a knife into him under the left shoulder blade—before this morning."

They spoke lightly. It seemed as if each desired for the moment to get away from their mood in the confessional of Virgil's grotto, and from the sadness of the white and silent day.

As to Ruffo, about whom they joked, he was in sight of Naples, and not far from Megellina, still rowing with tireless young arms, and singing to "Bella Napoli," with a strong resolve in his heart to return to the Saint's Pool on the first opportunity and dive for more cigarettes.

GUSTAV MARIE, ALREADY AIDED WITH THE METROPOLITAN'S FORCES, WILL SHARE EQUALLY WITH MESSRS. GATTI-CASAZZA AND TOSCANINI IN THE ADMINISTRATION OF THE AFFAIRS OF THE HOUSE.

The Original Discovery of America

ANTICIPATING Christopher Columbus by a thousand years and more, five Buddhist missionaries in 428 discovered west of China a big island with an estimated breadth of 10,500 miles between Atlantic and Pacific and distant 7230 miles from the Asiatic mainland. This definition of America, in which was given the name "Fusang," after the native tree of Mexico, was prompted doubtless by the route that led these "wise men of the East" into Alaska from Kamchatka by the Kurile and Aleutian Islands, and then south by the Pacific coast into California and Mexico, in which last state, the climate and the natives pleasing them, they finally established their headquarters.

In 429 Hui Shen, a Buddhist priest from China, visited Fusang, and three years later, after his return, reported to the Emperor. He related how a Buddhist mission had evangelized the "island" and ordained monks among the natives. Nor were the aborigines apparently forgetful of Hui Shen, since there exists to-day in Mexico the leg-end of one Wi Hui-see-cha, a name suggestive of the Chinese Hui-Shen-Ik-shu, who, come from far and hailed in a long robe, extolled morality and new religious dogmas.

That Buddhist missionaries forestalled the big event of 1492 seems probable enough. Spaniards who first had to do with Mexico found in her architecture, arts, and the science regulating these a strong resemblance to triaxial practices. Especially the forms of Buddhism prevailed. Thus Asiatic religions speak of Buddha, but rather of Quetzalcoatl or Sakhyu, names that, perverted more or less, obtained in Mexico before the Aztecs came. A Colorado legend perpetuates *Cañito Nara*, a compound of the two. At Cempoala is the image of a Buddhist priest in his regalia: at Palenque, a Buddha sitting cross-legged on a seat that represents two lions back to back. Among the Aztecs was a deity with the head of an elephant, although the elephant and lion were unknown in the New World. At Palenque, too, and Maya there are temples duplicating such in Java, the north of China, and Mongolia. Again, in Tibet and northern China Buddhist priests are known as *lamas*, but in Mexico as *Tinams*. While, finally, the form and the fauna of Fusang appear to have resembled closely those of modern Mexico.

All this does not detract, however, from the honors of Columbus, who, in obedience to the general law of civilized aggression, made his venture from the east to west.

There's twice the pleasure in the journey, and twice the pleasure afterward—if you

Melancholy

By John Kendrick Bangs

Melancholy,

I've no use for you, my Golly!
Yet I'm going to keep you hidden
In some chamber dark, forbidden,
Just as though you were a prize, sir,
Made of gold, and I a miser,—
Not because I think you jolly,

Melancholy.

Not for that I mean to hoard you,
Keep you close, and lodge and board you,
As I would my sisters, brothers,
Uncles, aunts, and aunts grandmothers,
But that you don't bother others
With your sniffling, snuffling, folly,

Huwling.

Crowling

Melancholy.

Not that Kind

A young woman in Philadelphia but recently married was enjoying the delightful novelty of marketing one morning shortly after the termination of the honeymoon.

"I wish to get some butter, please," said she to the dealer.

"Well butter, ma'am?" asked the man.

"No," promptly replied his customer; "we wish to eat it on toast. My husband doesn't care for rolls."

"Better than
THE SPOILERS"

THE BARRIER

FIRST of all, this new novel by Rex Beach is a big, buoyant, bracing story of the last frontier—Alaska—a story to equal "The Spoilers" in every way. This is one half of **THE BARRIER**. The other half is its triumphant love drama. In this the new book surpasses "The Spoilers."

By
REX BEACH

Author of
THE SPOILERS

In **THE BARRIER** there is a new setting, too, but still in the virile air of the North. The new people whom Mr. Beach makes live before you in the clean-cut pages of **THE BARRIER** are intensely human. More than one of them will become celebrities in fiction.

THE STORY? In the opening chapter of **THE BARRIER** the reader scents a mystery and is on the eve of a love affair. Old man Gale, a trader at Flambeau on the Yukon, the father of three children mothered by an Indian squaw, brings the story on with a rush. His daughter, Necia, a beautiful girl of eighteen, is **THE BARRIER'S** heroine. Necia falls in love with and is loved by Lieutenant Burrell, a young Kentuckian, arrived with a handful of men at the post to act as mounted police. From this critical moment there is not a dull page to the end. Some quaintly humorous characters are introduced also. In fact, the humor of **THE BARRIER** is another feature in which it surpasses "The Spoilers."

THE VALUE OF THE STOCK EXCHANGES

The relation of the great stock exchanges to the legitimate business interests of the country has been of late the subject of fierce and intemperate criticism. It is time that a true statement of the vital work done by these marts of trade, and their inestimable value to the country, should be placed before the public.

Such a statement, as authoritative as it is interesting, is contributed to the April 4 issue of HARPER'S WEEKLY

By HIRAM N. SAGER
PRESIDENT, CHICAGO BOARD OF TRADE

This issue will be on the news-stands April 1.

STORIES OF SYMPHONIC MUSIC

A Guide to Modern Orchestral Programme-Music

By LAWRENCE GILMAN

Music Critic of "Harper's Weekly"

This book fills a genuine need of the music-lover, for it offers in compact, accessible, and easily intelligible form information which will help him to listen understandingly to the music of an orchestral concert. It presents clearly and without technical analysis the poetic or pictorial or dramatic basis of every important example of programme-music in the symphonic repertoire, putting the reader in possession of information which will enable him to listen comprehendingly, for example, to a symphony by Berlioz, an overture by Mendelssohn, a symphonic poem by Liszt, or a tone-poem by Strauss or Debussy.

"The best thing for every concert-goer to do is to get a copy of Mr. Gilman's book and prepare himself beforehand."—*N. Y. Evening Post*

"From Beethoven and Liszt and Raff and Wagner, down to the latest works of Strauss, Debussy, Schoenberg, Ravel, Prokofiev, Elgar, Chabrier, and Copland, with many others that will occur to concert-goers, Mr. Gilman has left nothing that has any claim to the attention of music-lovers. . . . It is a useful and interesting book."—*The New Music Review*

"A valuable contribution to the music-lover's library."
—*Chicago Post*

COMMENT

New Laws Wanted

AMONG those that seem credible represent the administration an earnestly desirous that Congress during the present session shall pass three bills, namely: First, a bill to amend the SHERMAN anti-trust act to permit railroads to form traffic associations for the purpose of agreeing upon rates, regulations, and practices, and to pool rates, subject to the approval of the Interstate Commerce Commission. Second, a bill, inspired by recent decisions of the Supreme Court in the Danbury hatters' case and other cases, to exempt labor organizations from classification as conspiracies in restraint of trade. Third, to amend the employers' liability bill to meet the recent opinion of the United States Supreme Court that the bill as it stands is unconstitutional. Of these measures, the first will be an attempt to correct an old mischief grown more acute since the laws that created it have been more rigorously enforced. It was the abolition of the pooling privilege and denial of the right to make traffic agreements among themselves that drove railroads into the miseries and mischiefs of secret rates and rebates. Proper pooling privileges and the right to form traffic associations should undoubtedly be allowed them, and a proper bill to that end ought to be passed. What the approval of the Interstate Commerce Commission will mean in practice is matter of speculation; but so long as the commission exists and exercises the powers now intrusted to it, it is inevitable that these privileges which it is proposed to restore to the railroads should be made subject to the commission's approval.

Labor Unions to be Legalized

It was remarked the other day by an observer of agricultural operations that if two farmers in a township happened each to become possessed of a superfluity of young pigs, and they should meet and agree that the pigs were worth two dollars apiece, and that they would sell none for less, it would be a combination in restraint of trade under the SHERMAN anti-trust act, and make them both liable to prosecution. The SHERMAN act needs revision in this particular. If at present, under the decisions of the Supreme Court, it makes properly behaving labor organizations unlawful, it should be amended, but it should not be so amended as to give to labor unions an exclusive right to enter into conspiracies in restraint of trade. Our ingenious neighbor Mr. Harvey rebuked his editors the other day for finding fault with the recent Supreme Court decisions that affect labor. He considered boycotting illegal, he said, and was content that the courts should hold it to be so if they took the same view of blacklisting, and if both interpretations of the law were enforced with equal zeal.

Legal existence must, of course, and will, be permitted to labor unions, but so law, and no exemption from any law, should give them exclusive privileges to conspire in restraint of trade.

Democrats and the Sherman Law

THE SHERMAN anti-trust law, as placed upon the statute-books, was not an honest law, and is still an unwise and even a foolish law, as MELVILLE E. INGRAM pointed out in a speech which he made the other day before the bankers. In its efforts to deal with business it is as absurd as the medieval laws of Ewerton III. Notwithstanding this, the radical Republican politicians, who enacted it to satisfy some angry public outcries, and who never intended to enforce it, have been seeking to extend its operation beyond its own terms, and beyond the constitutional power of the Federal government, for the same improper reason that dictated its enactment. RICHARD OLNEY and JUSTICE HARVOT put it in operation on complaints of others, and directly or indirectly obtained from the courts decisions that now harmfully affect the railroad business, putting an end to such combinations as Mr. ROOSEVELT and Mr. TAFT are now forced to admit should be permitted by law. This result was not the fault of Mr. OLNEY or Mr. HARVOT, but of the law. The only rational decision, before those of recent date, on this statute was made in the KNIGHT case, and the only convincing opinion on the subject was written in that case by Chief-Justice FULLER, an eminent Democrat, who is revered where he is as long as he can hold his place. Chief-Justice FULLER, supported by the court, held that the State has complete control of the business of production, and that manufacturing is not transportation. Nothing can, therefore, be farther from the truth than the charge so often made that conservative Democrats have not done their duty by the political SHERMAN law. They put it in force, and thus demonstrated one of its worst features; while the Democratic Chief Justice has prevented it—if the Constitution and the courts are to be obeyed at all—from being used as a club to deprive the States of an essential right.

A New Employers' Liability Bill

As to the employers' liability bill, the court decided that Congress had no power to make it apply to railroads except those engaged in interstate commerce. The President wants a new law that shall meet the requirements of this decision. The law will also make the government responsible for accidents to its own employees, and especially to those employed on the Panama Canal. To these last provisions of government accident insurance for government employees there is likely to be a minimum of objection. If the railroads are to insure their employees against accident, they should have ample authority to enforce their own rules, maintain necessary discipline, and discharge careless employees without hindrance from the labor unions. It is asserted that they have not such authority at present. They should not be made pecuniarily accountable for the safety of men who rely on their labor unions to keep their jobs. Moreover, it is doubtful whether at the present time they should have any new liability thrust upon them. Reciprocity attest that many of them have already a heavier load than they can stagger under, and all of them are bent under severe burdens. So far as they are concerned an employers' liability bill had better begin in better times. Why not try it on the government first?

Merely After the Bucket Shops

The renewed Presidential onslaught on the New York Stock Exchange has divided to an inquiry into the operations of bucket shops. Secretary STRAUSS was quoted in the *Tribune* of March 14 as saying that the President has not ordered any general investigation of stock exchanges. So we seem to get great store of misleading news from Washington in these times; or maybe it is that the President modifies some of his expressed intentions. In his message of January 31 he differentiated between purchases of stocks for investment and "purchases of stocks or other securities or commodities on a margin for speculative and gambling purposes," suggesting that the Federal government could at least forbid "the use of mails, telegraph and telephone wires for mere gambling in stocks and futures, just as it does in lottery transactions." On top of this recommendation it was easy

to believe that the President was back of the HARPER bill to tax all stock transactions fifty cents a share, and then that there was truth in the report that he had ordered the Commissioner of Corporations to investigate the Stock Exchange. The Stock Exchange pokes itself on its virtue, and manifested pleasure at the idea of being investigated, but now it is only the bucket shops that are to be gone over. So many lies come from Washington that we are ready to disbelieve anything, but in this case the impression received is that since January 31 the President has been acquiring knowledge about what is done in Wall Street, and how and why; and that the more he has learned about it, the less disposed he has become to thrust the big stick in between the wheels of that machine.

Railroading in Texas

The Texas railroad commission is doing great things to the Texas railroads. Within five months it has ordered them to buy forty-five million dollars' worth of additional equipment, and has ordered five million dollars' worth of letter-masters to a few of the roads, and is expected to call for twenty-five million dollars' worth more. All this, besides some millions of expenditure which the Texas Legislature has forced upon the roads by direct enactment. The commission and the Legislature must be doing the roads a great deal of good. We read of new ties, new depots, better ballast, heavier rails—all good things—and of so many new freight cars ordered by the commission or bought in anticipation of such orders that the sidings of some of the roads are filled with them, to the embarrassment of the operators. The way to escape the commission's orders is to go into a receiver's hands, and this method is getting popular. So far as concerns the railroads already in the State and unable to get away, the commission's work seems a great thing for Texas, but Texas is going to need about five times as much mileage as it has yet got. How is it going to get it? Will it build its own roads with State money? Surely it cannot expect ordinary investors to put any new money into roads that are to be managed by a commission that has no responsibility to the stockholders.

Taft's Campaigning

Secretary TAFT is still campaigning, and he usually makes a good impression. Other people are campaigning, too, and the two forces are beginning to meet. The lines are closer to one another in Massachusetts than anywhere else, TAFT having won out, for the moment at least, in Ohio. When FORAKER has his third party, if he does, or if a bolt is made, matters there may change, but lately the TAFT forces have encountered the most serious trouble in Massachusetts. Senator CRANE and Senator LOUGHE are not in happy accord. Senator CRANE is stronger in the State than Senator LOUGHE, and while he is deft, and as inoffensive as it is possible to be under the circumstances, he has the better of a contest wherever he wants it. Senator CRANE has forced Senator LOUGHE to agree to an uninstructed delegation, although LOUGHE desires a TAFT delegation. Not only that, but Senator CRANE has induced LOUGHE to speak in favor of a free delegation on the ground that it is the practice of the State not to instruct. Congressman BUTLER AMES has confessed that he was at the bottom of the Florida affair which resulted in a protest against the interference of the Federal officers who sought to control the Republican primaries for TAFT. Congressman McALL says that he is for CANNON. Other Congressmen of the State are for others than TAFT, and HENRY in his recent visit made an excellent impression. Politics are beginning to be played, and while Senator CRANE has overcome Senator LOUGHE, it is very doubtful if he can prevent the majority of an uninstructed Massachusetts delegation from voting for TAFT.

The Southern Negro Politician

It has long been and is bound still to be a dirty job to get a Republican Presidential nomination by the votes of the delegates from the South. It was, and is, common knowledge that the Republican party machine of the South is completely controlled by the negro politicians and their white associates, who are often worse than the negroes; that those chosen from among themselves the delegates to the national conventions; that their votes in convention are purchased for one consideration or another; that part of their rewards are the Federal offices in the South, which are distributed among them with-

out regard to the public interests, and so greatly to the injury of the communities on which they prey that JOHN PASTER, then head of the Civil Service Commission and faithful friend of THEODORE ROOSEVELT, was once moved to say that by this corrupt employment of the Federal offices the South was treated as a "conquered province." Among the actual vices and crimes that had been committed by and for these Southern Federal officeholders, and which were brought to Mr. ROOSEVELT's attention six years ago by the report of an inspector of the Civil Service Commission, were the following: participation in smuggling over the Mexican line by a customs collector; frauds on civil service examinations by more than one internal revenue collector; the use of the Charleston Custom House by a Federal officer as a warehouse for storing liquor which the officer sold to the "blind tigers"; the keeping of post-offices by many negro fourth-class postmasters in their own low drinking-shops; the appointment to high places of notorious brothel and gambling-house keepers and of men who had been convicted of crime; the control of State party machines, of that of Virginia especially, by Federal officeholders who did precisely what Southern Federal officeholders are now engaged in doing, and who were then prosecuted for the offence. Reform of this sort of thing was in the air six years ago. Why is it right now, if it was a crying evil then?

Minnesota for Johnson

The Minnesota Democrats have set a good example in calling for the man they want, instead of the man whom Mr. BRYAN orders them to want. So, still more recently, have the Delaware Democrats in resolving that their candidate is Judge GRAY. May their example be contagious! If the Democrats in every State can only be induced to speak their minds, there will be a real convention at Denver.

The Trouble with Bryan

The *Wheeling Intelligencer*, a Republican paper of West Virginia, is in favor of BRYAN as the Democratic candidate. That is reasonable, but it is much less reasonable that the Democratic *Blairfield Leader*, which also wants BRYAN and rebukes the *WEEKLY* for opposing him, should take as much comfort as it does in quoting the *Intelligencer's* remarks upon the subject. The *Intelligencer* says (as quoted in the *Leader*):

The only argument that such newspapers as the *New York Herald* and *Louisville Courier-Journal* have been able to make against BRYAN is that he is "unavailable." . . . Insofar as the Democratic party has any principles and convictions on national questions, Mr. BRYAN is its mouthpiece. He has made himself the leader by sheer force of intellectual ability, the capacity to think deeply, quickly, and clearly on important questions and to sound a popular keynote. He has made many mistakes; he has yet to show the slightest evidence of executive capacity. His ascensions into the realm of practical politics have almost always been disastrous, but as the leader of Democratic thought in this country he has no equal, and he is the only candidate who will command the enthusiastic support of the Democratic voters.

The least of Mr. BRYAN's offending is his unavailability. It is the traits and qualities that make him so unsafe that are the trouble, and the ineradicable cause of his being unavailable. In popularity he is strong. Personally he is engaging. He is a man of great talent—we would not call it "intellectual ability," and certainly would not concede him the power "to think deeply, quickly, and clearly on important questions and to sound a popular keynote." He thinks quickly enough—while you wait—but not deeply, and his popular keynotes are wrong. He has been not a leader of Democratic thought, but a misleader of it, and so he bids fair always to be. He is an unsound thinker; that is the trouble; an irresponsible leader who looks to see where the flock is heading rather than what is ahead. His mistakes could be forgiven; he might be trusted to develop executive capacity; if it were not that his mistakes are absolutely characteristic of the man. He will always make such mistakes. He has great talent, but it is histrionic, not political; the talent of the actor, not of the statesman. Why, look at the man! Hardly any one hates him. He has no personal enemies worth counting. But for one thing all the Democrats who are opposed to him would be for him. That one thing is profound distrust in his ability to think right. But for that he would do. Being what he is, and what twelve years of conspicuous public life have shown him to be, he can never do.

The Japanese Exclusion Bill in the House

Only on the assumption that he is piqued, or on the assumption that he is subservient to his constituents, can it be explained why Representative HAYES of California, sometimes designated as "Red," has been making such a commotion over the intimation that the House Committee on Foreign Affairs would not report his Japanese exclusion bill. Japan having but recently agreed to regulate emigration in the manner suggested by the United States, exclusion legislation by Congress during its present session might suggest a disbelief in the sincerity of Japan which would have serious results. Moreover, there is no doubt that the full power of public opinion, even in his own State, is not behind Representative HAYES. This is what the San Francisco Chronicle has to say:

Some of us, at least, have common sense. . . . We recognize the sensitiveness of other peoples and consider it both reasonable and wise that foreign governments concerned should have time to create within their respective countries a public sentiment against emigration to countries where such emigrants are not desired. . . . When Oriental immigration has been diminished by the action of Oriental governments to an insignificant volume and no great economic interest will be suddenly and adversely affected, we can pass such domestic legislation as we desire without causing friction or ill feeling.

Notwithstanding Representative HAYES's zeal in trying to rescue his darling from oblivion, we may watch his exertions with equanimity. The most they can achieve is a delay in the consideration of needed legislation.

The Question of Armor Belt Location

The investigation by the Senate Committee on Naval Affairs having entered its fourth week, it is pertinent to inquire how far the testimony of the officers examined concerning the water-line protection of our battleships has tended to justify the alarm felt in certain quarters over the magazine obstructions of Mr. REUTEMANN. To the proposition that the belts do not extend far enough above the water line seven officers have assented more or less emphatically, and only one, Captain COWLES, of exalted association, has dissented. But when Admiral GOSWORTHY was asked if he agreed with Mr. REUTEMANN's statement that our battleships are as helpless as were ROJESTVENSKY's, he is reported to have said, "Oh no, I do not," and to have shaken his head for emphasis. Wherefore it seems fair to say that in the opinion of our line officers our battleships would fight with their belts neither as far above water as the Chief Constructor, nor as far beneath water as Mr. REUTEMANN, would have us believe. All our battleships have been belted on the theory that they would go into action with but two-thirds of their stores and somewhat less than two-thirds of their coal. But, as Admiral GOSWORTHY admitted in his report, and as Lieutenant WATTS is said to have testified, structural improvements introduced into many of them after they had been laid down have increased their draught anywhere—according to Admiral GOSWORTHY—from five to nine inches, so that their designed belt draught is actually fictitious. Further, some of the officers examined, noticeably Commander HALL, Captain WINSLOW, and Admirals REMY and GOSWORTHY, have attacked this theory of normal draught itself. In the opinion of Commander HALL, a battleship should fight with full bunkers; according to Admirals REMY and GOSWORTHY and Captain WINSLOW, she should have at least two-thirds of her coal and all her stores aboard. However, it seems unlikely that ships would go into action with a full supply of anything but ammunition, and with due respect for the opinions of the distinguished officers named, it is a disputed question whether there is any good reason why they should. Denying the truth of this assumption that they should, there is but a ray of Truth's clothing left upon Mr. REUTEMANN's comparison of our battleships and the battleships lost to Russia in Fushima Straits.

Unkind to the Kaiser

THE recent disturbance caused by the Kaiser's letter to Lord TUESMOUTH shows how difficult it is to eradicate rumor from the heart of the jingoes. The substance of the matter was that the somewhat laconic Emperor wrote a private letter to a more or less indifferent Lord of the Admiralty ascertaining that Germany's naval programme did not contemplate war with Great Britain. This was thoroughly in keeping with the Kaiser's uttered policy. So far back as 1891, when he visited England, he spoke for peace. At

Dusseldorf, in the same year, he said, "I only wish that the peace of Europe lay in my hands; I should certainly take care that it never again is broken." Two years ago at Bremen he announced, "When I came to the throne after my grandfather's Titanic age, I swore a soldier's oath that I would do my utmost to keep at rest the bayonet and the cannon." And only last November, at the Guildhall in London, he reassured England that "the main prop and base for the peace of the world is the maintenance of the good relations between our two countries, and I will further strengthen them so far as lies in my power." But a few years ago, in a moment of unfortunate indiscretion, the Kaiser sent a message of sympathy to KAISER, and a flame of jingoism broke forth that nothing can extinguish. The German Emperor's words seem to have been borne out in that he has undeniably kept the peace, but the jingoes, led by the *Times*, see nothing but cunning and menace of war in the Kaiser. And so easy is the descent to Averna that the *Times* is now stigmatized in Parliament as "saffron" and "yellow." In the House of Lords the paper was denounced as one "which seems anxious to create bad feelings between Germany and Great Britain," and Mr. SMITH MACLELLAN in the House of Commons asked that proceedings be commenced against the *Times* for spreading "false news," which is a misdemeanor in England. The Solicitor-General's reply was that the action of the *Times* might be safely left to public opinion, and England witnessed the curious spectacle of the *Daily Mail* lecturing "the Thunder." All of this should furnish an admirable object lesson to that section of our own press which has been overactive in spreading rumors of a possible lapse of amity between our country and Japan.

Vaccination, Some Antis, and the Law

We wish that some of our anti-vaccination friends could learn to be somewhat less extreme and violent in their contentions. The more zealous of them start with the assertion that nothing of importance has ever been learned from vivisection, and that it is not wise to give anesthetics to animals that are vivisected. In their publications are gathered dreadful stories, ancient and modern, of horrible cruelties committed by vivisectionists, which they offer as fair examples of what vivisection means. A good many of them are quite as earnest and indiscriminate against vaccination as against vivisection, and would as soon abolish the one as the other. They are also opposed to all the serums, and incredulous of the value of any of them in the treatment of disease. Statistics of reduced mortality—say, in diphtheria cases—gain no entrance to their minds and have no effect on their opinions. They know that there have been vivisectionists who have practiced atrocious cruelties, and have told of it, and they do not want to know anything more. These extreme and bigoted abolitionists are the people who are the most noisy in each recurring discussion of vivisection, but they contribute to it very little that is useful except volume of sound and impassioned presentation of the fact that vivisection is liable to abuse. Much wiser persons have drafted the bill of the Society for the Prevention of Abuse in Animal Experimentation, now before the New York Legislature, which aims to provide against the abuse of vivisection and punish it when it occurs. Forty-three of the leading physicians in New York have published in the newspapers a letter saying that the present law is sufficient, and deprecating the purpose to "fetter the discretion of qualified persons" by further restrictions. The opinion of these gentlemen carries great weight; nevertheless we read that the existing law has been amended until now it contains no provision for the punishment of persons who violate the little that is left of it, and so offers no protection against cruelty. It would seem as if a few teeth, not too sharp, might perhaps be adjusted to the present law without imperilling the progress of medicine. It is vitally important, however, that both the amendment and enforcement of the law should be the work of persons who think it more suitable to experiment on a dog to save a baby, than to experiment on a baby to save a dog.

To Our Readers

A "sample paper" called the *Broadway Morning News* was used by the editor of this journal as the text for a lecture delivered at Yale University. Any reader of HARPER'S WEEKLY who would like to see a copy can obtain it by sending name and address to this office.

How Tilden Lost the Presidency

It is a memorable illumination of a momentous crisis in American history for which we are indebted to the veteran journalist, diplomat, and statesman JOHN BUEZOW, unquestionably better qualified than any other man now living to narrate the important and interesting facts set forth in the two volumes which he has chosen to call *Letters and Literary Memorials of Samuel J. Tilden*, though the title does but scant justice to the editor, who has contributed a large part of the material. A great fraction of the book is devoted to an answer to the inquiry, How TILDEN missed the Presidency in 1876, and it will probably be conceded by all fair-minded men, whatever their political predilections, that Mr. BUEZOW has spoken the final word on the subject. He has shown that it is not true, as sometimes has been asserted, that Mr. TILDEN's failure to reach the White House was due to his own lack of an unswerving, resolute purpose, but should be attributed to two facts: first, that Southern Democrats cared more about relieving Louisiana, South Carolina, and Florida from the incubus of carpetbag government than they did about seeing a member of their party (Chief Magistrate); and, secondly, that Mr. ABRAHAM S. HENRY and some others of Mr. TILDEN's Northern friends cared less about securing the Presidency for him than for averting the civil war which, as they imagined, was threatened. The course which, from the outset, the most interested party, Mr. TILDEN, believed and declared to be the proper one is indicated in a statement printed in this work, a statement in the handwriting of Andrew W. SUTTON, Mr. TILDEN's private secretary, which was dictated by Mr. TILDEN himself. This is a document of incalculable value to the historian, and the substance of it should be made known widely and quickly. We can here merely outline its purport, but every American citizen who desires to know the truth concerning one of the most remarkable episodes in our political annals should read the statement carefully, as it is reproduced in Mr. BUEZOW's pages.

The private secretary begins by saying—the reader, of course, will keep in mind that every word was dictated by his employer—that Mr. TILDEN's views of the policy which the Democratic party in Congress will be remembered that the party was a minority in the Federal Senate, but controlled the House of Representatives—ought to pursue, in respect to the coming of the electoral votes cast for President and Vice-President in 1876, were perfectly defined and freely expressed to all who consulted him long before the meeting of Congress in December of that year. The policy advocated by him was to stand inflexibly on the unbroken series of precedents formed by the twenty-two Presidential counts from 1789 to 1872. As a matter of fact, Mr. TILDEN caused a collection of all those precedents to be made and printed while the committees of investigation in respect to the election of Presidential electors in Louisiana, Florida, and South Carolina, appointed by the House of Representatives, were engaged in their duties. At his request, Mr. BUEZOW prepared an analytical and expository introduction which was prefixed to the volume, and all of this material was published together by the APPLETONS in the latter part of December, 1876. Mr. MAXWELL MORGAN, then editor of the *World*, needed in preparing an appendix to the introduction, containing citations of authorities on the various points. Mr. BUEZOW's introduction was also issued separately in pamphlet form, and used in large numbers by the Democratic national committee. It presents undoubtedly a clear, strong, and well fortified exposition of the position which, in Mr. TILDEN's opinion, the Democratic party should have assumed.

On the 23d of December, 1876, two committees of the House of Representatives were appointed; the first on the powers and privileges of the House in respect of counting electoral votes; the second, of which Mr. HENRY was a member, to confer with a committee of the Senate on the same subject. During the ensuing Christmas holidays, and for some days after the 1st of January, leading members of the House of Representatives were in New York and had interviews with Mr. TILDEN. In his conversations with them, and with many others, he was frank and earnest in his advocacy of the making of an issue, first, in the House of Representatives, and then in the Senate. He was for asserting by formal resolution the exclusive right of the two Houses, acting concertedly, to count the electoral votes and determine what should be counted as such; and for denying, also by formal resolution, the pretension set up by the Republicans that the President of the Senate had any lawful or constitutional right to assume that function. Mr. TILDEN was for urging that issue in debate in both Houses and before the country. He thought that if an attempt should really be made to usurp for the President of the Senate a power to make the count, and thus practically to control the Presidential election, the scheme would break down in process of execution, and that in any event it was in the interest of popular elective government not to yield to the mere menace of usurpation all which actual usurpation could take for itself if completely successful. The statement dictated to the private secretary goes on to say that, on the request of some member of the House of Representatives, Mr. TILDEN himself drew two

resolutions for the purpose of making this issue, but the Democratic members of the committee on the powers, privileges, and duties of the House in the matter of counting electoral votes found themselves best able to agree on the simplest form of asserting their principles, and deemed the adoption of such a formula most expedient. A resolution to that effect was prepared by them, and, having been transmitted to Mr. TILDEN and returned with his approval, was reported by Mr. KNOTT, chairman of the committee, to the House. It will be found in the *Congressional Record* of January 12, 1877. On the evening of that very day Senator BARRETT, of Connecticut, who was passing through New York city on his way home, called on Mr. TILDEN and expressed his conviction that a majority of the Senators would concur in denying the right of the President of the Senate to make the count. He had not heard a word of the proposed contrivance of an Electoral Commission. It was afterwards ascertained that the Democratic Senator from New York had been left in equal ignorance. It was not until the 14th of January that Mr. TILDEN received from Mr. BEVERY his first information that the measure framed in pursuance of the policy recommended by him had been abandoned and superseded by the Electoral Commission bill. Before he read this new bill, Mr. TILDEN was told that the Democratic members of the Senate committee were already absolutely committed to the project, and would combine with the Republican members of the committee in reporting it unanimously to the Senate whether the House Committee of Conference should concur or not. "It is not rather late, then, to counsel me?" said Mr. TILDEN. "They do not consult you," replied Mr. HENRY. "They are public men, and have their own duties and responsibilities. I consult you." The examination and analysis of the bill then proceeded. In the course of the conference Mr. TILDEN said: "I can't advise you to agree to the bill. I will advise you as to its detail." In respect to the provision by which six judges were to be designated in the bill, and one of them to be eliminated by lot, Mr. TILDEN said emphatically: "I may lose the Presidency, but I will not raffle for it." Mr. TILDEN further said that if an arbitration were to be adopted the tribunal ought to be fixed definitely in the bill itself, and not left to chance or intrigue. He said, also, that if an arbitration were to be adopted the duty of the arbitrators to investigate and decide the case on its merits should be made mandatory, and not left as a question of construction. With both the vital points—namely, the choice of the men to compose the tribunal and the nature of the function to be performed by the tribunal—left at loose ends, he treated the whole thing as a sort of gamble. Replying to the apprehensions expressed by Mr. HENRY of a collision of force with the Federal Executive, Mr. TILDEN said that he thought them exaggerated, and asked: "Why surrender now? You can always surrender. Why surrender before the battle, for fear you may have to surrender after the battle is over?"

Mr. TILDEN was pressed to say that if the Electoral Commission bill could be modified so as to fix the five judges by a positive provision he would give it his approval, but he firmly declined. No argument or persuasion could extract from him a word of personal sanction to the scheme.

It is evident from this statement that Mr. TILDEN condemned the proposed action of Congress not only on the score of principle, but on the score of expediency. It was a month before the time for the count, and he saw no reason why there should not be an opportunity afforded for consideration and consultation by the representatives of the people. He did not ask any time for himself, or time in which to decide what he would do in respect to the proposed Electoral Commission. He never for a moment evinced the slightest hesitation or doubt about his disapproval of it. In that he was clear and inflexible, but he advised more deliberation upon the part of those who were to act in Washington. He believed in publicity and discussion and a wider consultation. In a word, he had an inherent and ineradicable distrust of the Electoral Commission scheme, and also deprecated the secrecy with which it was hurried through Congress. He frequently said afterwards that so great a stake as the government of forty millions of people, with immense civil expenditures and a hundred thousand officeholders, if left to be disposed of by a small body of men sitting in the Capitol, would become the sport of intrigue or fraud.

The Cult of Beauty

One sometimes stops to wonder if beauty still increases in the world. Certainly in proportion to the phenomenal spread of ugliness it proves as shy and difficult as a rose in an undrained field of weeds. As life ages past us, it is natural that coldness should invade us and hope be less buoyant and upspringing. We have seen the mutilations of sins and sorrows; we have learned that to live we must renounce partnerships and let the world wag its own way; the soil of a man's heart by mere natural processes of existence is like to become fit for negations and indifference. How

have the things we set our faith upon crumbled and betrayed us; how do our friends pass out into the unknown, inscrutable future; and as for our desires, either we cannot attain them and in their stead there lives in us a sense of blank failure and desolation, or we do attain them and find them bitter as dead sea fruit, or useless and gray as winelands asleep, pondering our blossom.

To this pass must we all come at some time; all except those very brisk and busy folk who do things so hard that they have no time to look up or down or round about and so manage to get through existence without discriminating between beauty and ugliness at all. These people, it has been said, make the world go round; possibly they do, but one thing is certain, they do not make it swing to music, and if the earth joins the stars in the chorus of the spheres, it is not their doing.

At any rate, with these we are not dealing here, but with those who constantly discriminate between what is fair and ennobling and what is ugly and degrading. If we will have life repay us, even to the last when age and decay encroach, then if *facta est vita*—one must be an unremitting gardener of life, one must hoard beauties, one must keep record of them as they flit, one must be ever alert to catch the essence of the rare and worthy moment and to prolong its life in memory and in written annals or initiative images. If we ourselves live largely by the past, we also are creating a new past for posterity, and it matters infinitely that our legacy to them should be beautiful; not merely useful or labor-saving or protective, but that it should have in it that beauty and harmony which alone console us in age and make life, looked back upon from the vantage of half a century of days, a feast of exquisite though transient impressions. What shall a legacy of smooth pavements, surgical institutions, well conducted insane asylums, and fast trains mean to a folk pining for old gardens, safe by paths, wholesome and quiet living, and openness up to the wide horizon line where God paints his miracles?

No, when the paralysis of old age creeps upon us and our hopes no longer live on the mere animal spirits of youth, it is the beauty we may have watched by the way which shall console us and lighten us. Comfort and successes wear thin as poverty and failures. If we have placed our faith in any material thing:

"Just when we're saddest, there's a sunset touch,
A fancy from a drowsy sleep, some one's death,
A chorus ending from Euripides—
And that's enough for fifty hopes and fears
As old and new as once an Nature's self
To rap and knock and enter in our soul,
Take hands and dance there, a fantastic ring
Round the sacred stone on his base again—
The grand Perhaiot!"

Who can look back upon his fifty years of days and take solace and comfort in life over the problems of being because, forsooth, he has managed to sleep in linen shirts and have well tempered bedchambers. There is no solace in that, but there does come a solace to him who has slept out under the stars, watching them wheel slowly on their orbits about "that some star that's westward from the pole"; and though a man shall have read all the newspapers every day for ten or twenty years and all the current events of the same years thereunto, it shall no more console him for having lived when he steps on the threshold of old age to look back, than would a glimpse of devilfishes or cactus in a dull sand desert, or a sordid back yard full of weeds.

Only such beauty as we have found and treasured can keep the heart in us. Either the beauties we have read of, or seen and pondered, or, if we be of the most fortunate of the sons of men, the beauties we have created, or, seeing, have known how to give account of and spread wider their fame.

There fell by chance to a student's table recently a volume of extraordinary and rare quality and value, and the story of it, as we gathered it, was like this: There was a man once who had a failing despised of all people; he was hopelessly and insensibly shy and inept at human intercourse; he was cut off by this defect from human ties; marriage and children were out of his reach; even the ties of friendship were difficult to him, and yet conquered he refused to be; he determined to gather such beauties as might yet belong to him and keep record of them.

"Uniting in one person the physical exuberance of youth and the nobility of disillusioned manhood, I was deprived of the balanced energy of either age and kept up a bravest courage with the bravest view of literature. I could not bear the island homeliness of the provinces, but raised myself with the apostle of rebellion who blew imperious blasts before the walls of civilization."

Yet, being one of those who intended to use every force at command to subdue life, in spite of every defect, to some semblance of beauty, he taught himself first of all to quit the company of cynics and lamenters, and there trooped instead into his memory, "with a quiet pomp and induction of joy, forms of men who, though justified in rebellion by every human outrage, remained loyal to the sad and proved by endurance a more imperial humanity. Scattered, unperturbed by mortal injuries; there, a deep, harmonious voice amid jangling destinies; William the

Silent, serene in every desperate conjecture—these seemed now the more perfect exponents."

And midway in the book he who makes confession learns and gives us this great truth, "that life may not be centred in itself but in the going out of the heart in wisdom."

And from this page on the book is a confession of triumph and of gathered joys; the joys of vision and free living in the open, the joys of sounds and of music, the joys of the faith of little children, joys in the philosophy which trusts in the slow diffusion of the worlds with intellectual light, and finally the joy of noble achievement; for those lonely antiast disillusionment and help us to meet the inevitable with the appeasement and the calm which surpass understanding, and give us faith in the endurance and the ultimate triumph of beauty. And then we may face old age, neither sullen nor despairing, but like the old man in ANAXAGORAS' "Old Thought" who had outlived all his contemporaries and who sat among his curiosities and antique treasures all alone.

"They say at home," said the little boy, "that you are always alone."

"Oh," replied the old man, "the old thoughts with all that they bring with them visit me; and now you come too. I am very comfortable, I'm sure."

Personal and Pertinent

Mrs. STURGE HENNINGSEN has written an excellent book about GIMMIE MEREDITH. In it she discusses a problem which many women have discussed before, especially the cultivated classes of America—otherwise women. So many men have tried to read *Diana of the Crossways*, and have been discouraged by the enginematic introductory chapter, that it may be necessary to explain that the most dramatic episode in the book is the sale to TOMMAS by DIANA, pressed for money for the maintenance of her "social position," of a state secret imparted to her by DUVER, the statesman. DIANA admits to DUVER that she sold him to the newspapers because of her "dire need of money." Mrs. HENNINGSEN says that this is a defect in DIANA's character; that no woman would have given such a reason for the betrayal of her friend, true or untrue. After all, however, would not a woman, the most direct of creatures, reason that frankness would be her best defence? also, would she not employ the defence that would arouse the sympathy of a man whose sympathy she desired? It is partly worth while, perhaps, to allude to the discussion because DIANA is an historical character. She was CAROLINE NORTON, who was accused of selling to the *London Times* a state secret which she obtained from SIRNEY HERBERT. HERBERT based his episode on what was regarded as a fact. After the publication of *Diana of the Crossways* it was proved that CAROLINE NORTON was innocent.

SAMUEL P. FENNERMAN, the Connecticut Republican politician, was the "JOE" MANLEY of his State. He was a great friend of the Maine men, and they used to admire one another as a brace of WASHERS. They made kings and were happy, and they were fortunate, too, in the possession of local influence and in distributing local patronage. They were both MAINE MEN, and saw their favorite beaten with much grief and sorrow. FENNERMAN was really a Maine man himself, having been born at Rockland, nearly sixty-one years ago. Not much of his married life, however, was spent in the Pine Tree State. He was a scholar of the Levinson Academy, where he knew about NELSON DINGLEY, who, as TOM REED once said to MANLEY, "would rather make figures on the back of an old envelope than hold a pretty girl on his knee. Not that he would do anything like that, Joe," added REED; "but we'd like to, and DINGLEY wouldn't." After FENNERMAN got through with his schooling he went to the war, where he was a private and a cannon shooter, a captain of rifle shooters, and a staff officer. Then he went to Harvard Law School, and after graduation practised law at Stamford, Connecticut. Since 1880 he has been State's attorney for the county in which Stamford is situated, Fairfield. In 1874 and in 1883 FENNERMAN was a member of the popular branch of the Legislature of Connecticut, and in 1891 he was a State Senator. He tried to be United States Senator, but some minister sold hard things about him, and MORRIS HITCHCOCK defeated him. We say no more, only that FENNERMAN was a large part of the Republican party of Connecticut, and had to be reckoned with at national conventions. He was probably abused unjustly. Most men who are abused at all suffer from extravagant and exaggerated statements, if not from intentions. He was a partisan, a hard bitter, and he was so serious and astute in his opposition that he was not popular enough to attain high office.

It doesn't make much difference what kind of politics Boston is afflicted with, nor does it curb the tongue nor still the restless brain of Bronson Hill and adjacent byways. That literature and art prefer to go to Boston, for an occasional visit, than to New York, if criticism—without criticism—is left to the populace. Sometimes it seems to take a long time for the critical faculty to get around to the subject of its remarks, but that is apparent more than real;

There is such a basketful of subjects for the flautonians to deal with, that they sometimes are bored. At any rate, they have just got around to SAINT-GAUDENS'S SHAW MEMORIAL. Dr. EDWARD H. BARNES says that the sculptor put the wrong pose on the negro soldiers; that he has made their steps drag, and in this the doctor is sustained by a portrait painter. Mr. DANAHY'S CUMA asserts that SAINT-GAUDENS got a coal-heaver for a model, and that it is well known in the suburbs of art that an humble coal-heaver hasn't it in him to walk like a soldier. Mr. COHN is not only a portrait painter but a sometime soldier. No they sat down to gossip about the SHAW memorial, and Boston was about to lose all respect for a work of art that New York would have taken off its hands willingly and promptly. It could have done it, too, for the SHAW family lived on Staten Island, and one of Colonel SHAW'S sisters married GEORGE WILLIAM CURTIS, who was also a typical New-Yorker, having been born in Providence. New York might have been further attracted to the work despite the drawing-gait of the negroes, because SAINT-GAUDENS came from the Bowery. But superior Boston came to the rescue. WILLIAM LIZON HARRISON said that the memorial is "the finest thing of its kind in the city." That is GARDENHURST and Bostonian. It will do even for Boston. THOMAS WENWORTH HERRINGTON says that the "memorial has never impressed me as other than correct in every detail." This ends it, and it ought to. There are Bostonians who know that this work of genius embellishes their city, and they are duly and humbly grateful for its possession.

Correspondence

DR. DAY'S CASE: THUMBS DOWN

GRANTVILLE, G. M. March 2, 1908

To the Editor of Harper's Weekly:

SIR.—Of course the interests of religion and morality demand that Chancellor Day be tried, condemned, and severely punished for his attacks on the President, and as no other court has taken the matter up the Rev. George A. Cook has felt justified in resorting to that of the local conference of the Methodist Episcopal Church, to the jurisdiction of which the offending Chancellor belongs. We have only to go back to the reign of Domitian or Tiberius to find that the Tiber got the bodies of many a Roman, strangled and hung over the rocks for a far milder indiscretion in freedom of speech than that of which Chancellor Day has been guilty. We wonder, however, that the delator, Mr. Cook, has been content to bring his charges against the Chancellor, and not the Methodist discipline which warns against "uncharitable or unprofitable conversations, particularly speaking evil of magistrates or ministers." Why not proceed under the injunction "Touch not mine anointed, and do my prophets no harm," which has a higher validity than even the Methodist discipline? In treating Chancellor Day's case as a mere infraction of ordinary rules of discipline the accuser puts him on a level with such commonplace offenders as Professors Huxley, T. Mitchell and E. B. Rouse, whom he prosecuted for heresy. In these cases it was only the Bible that was offended against. Cannot Mr. Cook see that in treating the case alike he is really belittling the President? Does he not know that an offender against a supremely great man gets a kind of inverse nobility from the grandeur of his victim, which entitles him to special consideration in his punishment? Was Huxley's torn shoulder by horses for depriving France of the services of Henry the Fourth, and shall Chancellor Day, who has attempted to thwart the services of Theodore the First, be belittled by the mere infliction of such penalties as attach to an infraction of the Methodist discipline? Was Pompey Marcellus denied fire and water by decree of the Roman Senate because her great grandfather had been a friend to Pompey, the leader of the Reactionaries against the popular measures of Theodore's empire-building prototype, and shall the man who has questioned the wisdom of Theodore himself receive no more consideration than to have his case heard in an inferior court, as an infraction of half of a subordinate phrase of a subordinate clause of a subordinate paragraph of a code of rules primarily intended, not to save the nation from the machinations of traitors at all, but merely to make clutich members obedient to us as to avoid scandal in their home communities? No, the Chancellor has fairly won the honor of proceeding down the ages in the distinguished company of learned examples of averaging justice upon prodigious crime. Ad Theonem? Ad Theonem? I am, sir,

W. H. JOHNSON.

"TOUCHING HANDS WITH ETERNITY"

To the Editor of Harper's Weekly:

SIR.—Having just read with much interest the article on "Touching Hands with Eternity" in a recent number, I would like to add a word as to the work of the "aesthete" in such communications. The part played by this functionary is usually relegated to the province of the mysticisms, where it is to his interest to let it remain. A word then from this standpoint, with a view not to expell automation, but to investigate it. In a purely scientific spirit, may not be a little interest. A short time ago, upon the suggestion of a friend who, for some reason, saw in me a possible skeptic, I made the experiment of automatic writing. To my great surprise, my hand at once began to write, apparently

without no volition, what is known as "mirror writing," proceeding from right to left. The condition was merely the closing of the eyes while fixing the mind upon a word or phrase and, later, by thinking of some subject, and then concentrating the attention upon something else while the writing was in progress. In this latter way alone can a true test of automatic writing be made. If the attention of the "automatist" is not diverted by this dissociation of the mind from the movement of the hand, he will receive suggestions from his inner consciousness which will affect the movement of the hand. For instance, when the hand begins to form a word the mind guesses what the word is, or if a proper name of a sentence is being formed, supplies, from its previous knowledge, the remainder. For the person who is writing, if in a somnolent state, need not remain ignorant of the words he is forming, even if his eyes are closed. Any one with ordinary sense-perception must know what he is writing as well as if he were reading it with his eyes, unless his attention has been purposely diverted. The expedient of the pillow upon which to rest the forehead and cover the eyes is as entirely unnecessary as it is ineffectual to prevent collusion. The part of suggestion played by the mind of the "automatist" is quite enough to explain the failure of a message to "get through."

The whole subject is, however, so loaded against with difficulties that a conclusion seems at present impossible.

For myself, I have written automatically, while in the act of reading a story in a magazine, the name and also what I perceived to be a very characteristic message of a friend who had recently died. While in this instance I did not know what I was writing as it was transcribed, I do not believe that it was a communication from the spirit world. What is easier than to formulate a message from a dead friend with whose habits of thought one is familiar? Respectively, it is quite possible to place one's self in rapport with the spirit of one who has passed away, and to imagine what our friend would have said upon a given subject or upon a certain occasion.

As yet, Sir Oliver Lodge to the contrary, no positive proof seems to have been given as to anything more. The instances mentioned in the article in question may all be explained in this way, or by the supposition of telegraphic communication through the mind of the "automatist." This telegraphic communication must, it would seem from various testimony, be admitted, and in these cases the automatist was able to receive it. This, with the possible exception of matters in the communication of Dr. Hodgson which Professor Hyslop did not know, would explain all. As to these matters unknown to Professor Hyslop, they might be relegated to these innumerable impressions received by the subconscious self which never reach the level of consciousness, or, if they do, make so faint an impression as to be unrecognized as ever having entered previously, should they be recalled. Automation may be of service in collating up anything from the vasty deep of the subconscious mind, an ultimate service enough, but that it can be the means of communication with the dead is, as yet, lacking a demonstration.

As my purpose is merely to utter a warning as to the unsubstantiated acceptance of and from the "automatist," not to enter the arena in that capacity, I sign myself,

A SKEPTIC.

SOLDIER BRIDGE-BUILDERS UNDEPAID

GRANTVILLE, N. M. March 3, 1908

To the Editor of Harper's Weekly:

SIR.—In your issue of February 22, Lieutenant GRAY has a good article on "Bridge-Building," showing what our army can do, but to me it also shows why so few young men will go into the army in times of peace. A few weeks ago I saw in the paper that this same army post only averaged about ten men to the company; their time was out and not a man to re-enlist, and for the reason that they were called on to do something for \$13 that they should have been paid five times as much for.

I am, sir,

H. W. RESSLER.

PREFERABLY DEAD

GRANTVILLE, Pa., March 12, 1908

To the Editor of Harper's Weekly:

SIR.—I noticed a very clever editorial in the WEEKLY for March 14 headed, "The Golden Age of the Reformers." Allow me to alter the last few lines of that article so as to read, that when "Jack London is President, and Bryan is Congress, and Arthur Brisbane and Upton Sinclair are the Supreme Court, and George Harvey is either senator or dead, what a wonderfully improved country this will be, and how very, very, very happy shall be our lot if we leave the great good issue to be living in it!"

I am, sir,

H. F. JENNEY.

WE DON'T WANT ANY UNFIT MAN TO BE NOMINATED

BRISTOLTON, Miss., March 13, 1908

To the Editor of Harper's Weekly:

SIR.—Can you give a plausible reason why you and two or three other Republican leaders of New York have previously endeavored to create an unfavorable sentiment to Mr. Bryan six months prior to the assurance of his nomination? And you Republicans at the same time prodding his defeat if nominated, and advising and urging the Democrats not to nominate him. Surely you being Republicans you do not wish the triumph of a Democrat? Then why do you advise the Democrats to nominate some other man who you think would make a better run? If you find space and time, please give the country an answer.

I am, sir,

A BYSTANDER.

The Vanishing Forests of America

By ROLAND PHILLIPS

FOLLOWING the special report of Secretary of Agriculture Wilson, sent to Congress on December 11, identical bills were introduced in the House by Representatives Lever, of South Carolina, and Capper, of New Hampshire, appropriating five million dollars for national forest reserves in the Southern Appalachian and White Mountains. The passage of these bills at the present session of Congress will add 5,000,000 acres to the forest area now under government control, and will bring the total national forest holdings to about two hundred and seventy thousand square miles—a region exceeding five times the area of New York State and nearly one-fourth of the entire forest area of the United States.

In connection with the great State reserves of a million and a quarter acres in New York, seven hundred thousand in Pennsylvania, and so on, this will place the head waters of every important navigable river under direct national and State supervision.

It is worth while to inquire just what this means to the great business interests and to the public.

At the present time the estimated forest area in the United States is from 500 to 700 million acres. In 1906 the Forest Service reported the total lumber production at thirty-seven and a half billion feet, with a mill value of nearly six and a quarter million dollars. This is the largest quantity ever reported for a single year, and by far the greatest value. If there be added to the lumber production the amount of timber used for laths and shingles a fair estimate of the total lumber cut will be found to be forty billion feet, with a mill value of not less than seven hundred million dollars. Under present conditions it is safe to say that the annual growth does not exceed sixty board feet per acre. In other words, it appears that the annual growth covers only the amount of wood used for lumber alone. Considering all drains upon the forests, it is certain that under the present methods of immoderate and wasteful cutting the annual consumption amounts to at least three times the amount actually grown every year.

Under these conditions Forester Gifford Pinchot estimates that the timber supply of the United States will be exhausted in from twenty to thirty-three years.

"When this time comes," says Mr. Pinchot, "unless measures are taken to prevent it, the lumber business, now the fourth greatest industry in the country, will disappear; suffering among the building interests will immediately follow; the price of coal, iron and all other minerals will rise; the railroads will be directly affected, and the cost of transportation and water power will immediately increase. In short, when the forests fail, every man, woman, and child in the United States, will feel the pinch."

To the casual observer it may seem an impossibility that our forests should ever fail; but, as a matter of fact, the "pinch" has already been felt in an alarming degree by all lumber consuming industries. In spite of an increased supply, the price of timber has never been so high as now. The builders have felt it and have passed the burden to the public. The newspaper publishers and users of white paper generally, hard hit by the scarcity of wood pulp, are appealing to President Roosevelt for relief through the tariff. The railroads, whose annual consumption of hard wood ties alone amounts to more than

one hundred million, are in several instances employing their own "foresters" and experimenting at considerable cost with new methods of "tree preservation." When one stops to consider that in the single item of matches the consumption amounts to about a million and a half a minute in the United States, and that it requires sixty million feet of timber, or the growth of ten thousand acres of selected forest land, to supply the yearly demand, one will realize to some extent the many sources of the tremendous drain on the forests.

To cite one other example: In the hard-wood working industries, including hard-wood lumber manufacture, furniture and house furnishing, the manufacture of farm implements, carriages, freight and passenger cars, and other industries requiring immense quantities of hard wood, the last ten years have brought an increase in the wholesale prices of various classes of hard-wood lumber ranging from twenty-five to sixty-five per cent. This is the direct result of an imminent shortage in supply, due in large measure to wasteful forestry methods extending over a long period of years.

At the present time the available supply of every State and locality where hard wood grows in sufficient quantities to be cut with profit is being utilized to supply the demand. In spite of these efforts, the returns show that several of the most important hard woods, including oak, poplar, elm, and others, are being rapidly exhausted, and that the total supply has fallen off about fifteen per cent. This means that in the seven years preceding 1906 the decrease in the hard-wood supply is equivalent to the annual growth on a tract of land approximately the size of New York State.

Naturally hard-wood lumber manufacturing has been the first to feel the effects. In 1906 the production was more than cut in half between 1900 and 1906. In Indiana it fell off about one-fourth in the same period. It is a question of a comparatively short time till the great industries, such as furniture establishments and the vehicle makers, representing a combined capital of more than three hundred millions and a production considerably exceeding that sum, will be forced to meet, if not a famine, at least a long continued shortage which will raise prices far above their present high level.

The American Forestry Association, of which Secretary Wilson of the Department of Agriculture is president, and which has long been active in the support of forestry preservation, has recently collected the views of a number of government experts and others, showing the vast interests that would be affected by proper forest management and control. Referring to the splendid work done by the government in reclaiming lands for the purposes of agriculture and homesteads, F. H. Newell, Director of the United States Reclamation Service, says: "In six years the government has reclaimed 250,000 acres, upon which are now living 20,000 people, representing 4000 families. It is a reasonable estimate that in another decade 2,000,000 more acres may be reclaimed, upon which 250,000 more human beings may maintain themselves in reasonable comfort. The water for this work comes chiefly from streams rising in mountains. To maintain the supply of this water it is essential that forests be maintained upon these mountains. To this end national forests are indispensable."

A further effect of the uncontrolled condition of the forests is forcibly pointed out by W. J. M'Vie of the United States Inland Waterways Commission and

A desolate Area of dying and wasted Timber in the Southern Appalachians

A Valley made Fertile as a Result of carefully conserved Forests

Bureau of Soils. "The waterways of the United States," he has said, "annually sweep from land to sea a billion tons of earth. Of this ninety per cent. is chiefly soil matter. Its weight is comparable with the total tonnage of all our railroads and river and lake vessels. Its bulk is one-fifth of a cubic mile; it equals a block one mile square over a thousand feet high. Applied as a fertilizer, it would cover, to the depth of a quarter of an inch, an area of about 250,000 square miles, or the land surface of all the Atlantic States from Maine to South Carolina, inclusive, with Vermont, New York, Pennsylvania, West Virginia, and one-third of Georgia thrown in. Its value may be estimated as at least a billion dollars. Its loss is the heaviest impost borne by the American farmer. This soil waste is making a resource richer than all others combined save one, namely, our inland waters. These, immeasurably our richest resource, are, in great measure, perverted from a blessing into a curse. And both soil wash and river ravage are largely to be traced to the absence of forests from slopes on which rivers rise."

A statement made by M. O. Leighton, Chief Hydrographer of the United States Geological Survey, shows the influence of uncontrolled forestry methods, and the despoiling of forest areas upon our inland waters. Referring to these rivers as "our greatest natural resource," this authority continues: "The water flowing down our Western mountains far exceeds in value the fabulous wealth represented by all the metals and minerals lying between the Rockies and the Pacific. To-day most of this resource is wasted. Each year at least 1,000,000 horsepower runs over Federal government dams. Halted at twenty dollars per horsepower, this would yield \$20,000,000. Capitalized at three per cent., it represents an investment of \$1,000,000,000, now wholly wasted."

Further, uncontrolled water is a curse. Flood damage in the United States exceeds \$100,000,000 per year. With our water controlled and utilized this sum might be saved, and a fivefold greater value produced."

It is evident, therefore, that while purely sentimental reasons have been futile in checking the frightful waste of our national resources, particularly in the forest areas, the vast economic interests at stake must in the very near future arouse the public to vigorous action. The forest demolition has kept pace for many years with the uncontrolled misuse of national resources in coal, natural gas, mineral oils, and in government lands.

It is only fair to say, however, that for this state of affairs Congress is largely responsible. Under what is known as the "Timber and Stone Act," it was provided

A Valley made Arid by ruinous Floods due to depleted Timber-land

cloaked more shady proceedings in the withdrawal of public lands than all others combined. Under the commutation clause of this law the entries of timber land are permitted, and have been widely made for no other purpose than to strip the lands of the forests or to control land adjacent to waterways. This clause permits a brief period of residence on condition of a cash payment, which in a very large number of instances is provided by land operators. The result is that they reap the benefit, while the individual citizen, in whose interest the law is supposed to have been enacted, receives only bare wages. Cases have been known in the Land Office where houses for residence purposes have been built on wheels and moved from one tract to another in order to take up desirable lands, and one instance is noted where an entryman, required to specify measurements, stated that his house was fourteen by eighteen. He neglected to make it clear in his statement that these dimensions were not in feet, but in inches.

While such abuse can be, in a large extent, eliminated by the creation of national forests, the Forest Service admits that this influence has practically just begun to be effective. Thomas H. Sherwood, Assistant Forester, who has made a careful study of this subject, says that "at first the national forest-land no appreciable effort upon the lumber industry." He says that consumers of wood and other forest products who were dependent upon the forests were confronted at first with impractical and troublesome regulations, and that unnecessary delay in transacting business added hardship, and fostered a feeling of hostility toward national forests among those who came into closest contact with them, and who should have been made most sensible of their benefits.

It was not until the large withdrawals of land for national forests in 1903 and 1904 that "bodies of timber, at-

Forest Land in the White Mountains in Course of Destruction

tractive to private enterprise" were included. By these withdrawal entries under the "timber and stone" act and the "lumber" act were checked. When the administration of national forests was placed under the Department of Agriculture, in February, 1905, the effect upon the use of timber was almost instantaneous. Money returns from the sale of timber for the fiscal year ending June 30, 1905, were fifty thousand dollars. This increased tenfold in 1907 and 1908, and the sale of timber made at that time amount to more than one and a half millions dollars.

The essential point is that while four-fifths of the total timber supply is still under private ownership, the establishment of national forest reserves will insure the greatest legitimate use of all resources on timber lands, and, as the present supply decreases, will tend to prevent future speculative monopoly. The small operator and the sawmill man of small means are relieved of the possibility of litigation over defective titles. They require no large initial investment to secure timber land. They are relieved of taxes and cost of protection, share all risk from fire and other causes as assumed by the government. Moreover, it has been found that non-speculative operators who own large tracts of timber land on the Pacific coast are turning to the national forests. This is in spite of the fact that sixty-five per cent. of the merchantable timber in the forests is located in this region, and that these privately owned tracts must be counted upon as the backbone of the national supply for some years to come.

Up to the present all timber lands included in the national forests are located west of the Mississippi. The areas selected have been taken from the public lands. In the East and South the situation is different. Here practically all of the valuable forest tracts are owned by individuals or corporations, and the government must secure its property for national forests by gift or purchase.

According to the provisions of the bill now pending in Congress relating to the creation of national forests in the White Mountains and Appalachians, the Secretary of Agriculture is authorized to acquire "by purchase or gift lands more valuable for the regulation of stream-flow than for other purposes, and situated on the watersheds of navigable streams in the southern Appalachian Mountains within the States of Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Kentucky, and Tennessee, and in the White Mountains within the States of New Hampshire and Maine."

In these purchases the mineral wealth and merchantable timber remain the property of the original owner.

It is the purpose of the government to introduce at once scientific and up-to-date forestry methods, and, at the request of owners, to protect and develop any forests under private control within the prescribed area. At the outset it is proposed to buy rough or "cut-over" land, where it may be secured at average prices ranging from three and a half to six dollars an acre. Each county is to receive ten per cent. of the total proceeds from

the sale of timber and from all other government receipts. To make this plan successful it is obvious that extensive cooperation of private owners of timber land must be secured. Although a very considerable number of large operators, including some of the most important pulp and paper companies, have already adopted government forestry methods, many have been deterred on account of the burden of taxes on forest lands. These operators say that so long as they are obliged to pay taxes on their forest holdings, they cannot afford to cut on scientific principles and keep their land safe, under taxation, waiting for a new growth of timber.

This argument has been recognized as a reasonable business proposition by a number of States, including Maine, Pennsylvania, Connecticut, New Hampshire, and Wisconsin. In these and other States forest taxation has already been reduced. This principle applied to the southern Appalachians by legislative enactments in the various States would be of material assistance in securing the co-operation of individual owners and in carrying out the policy of "forest perpetuation" in the South.

It is likely, however, in view of the vigorous public support which has been secured in New England and the South largely through the efforts of prominent advocates like ex-Governor Rollins, of New Hampshire, Governor Comer, of Alabama, and Hon. Ligon Johnson, President of the Appalachian National Forest Association, that the substantial benefits of a settled forest policy are sufficiently well recognized to make the proposed government action a success regardless of present methods of taxation.

The most obvious of these advantages may be briefly summarized as follows:

First: The Appalachians are the only remaining source of hard wood supply, and it is estimated that this supply will be exhausted in about sixteen years. Under proper forest management this region will produce a supply equal to the present demand for all purposes.

Second: The present water power developed in the streams of the southern Appalachians, amounting to about three million horsepower, of which at least one-half is available for economic use—will be increased from three to thirty times by the development of storage facilities of these streams. New England will be equally benefited by this vast resource.

Third: The losses from forest fires in one region alone, including the area from Virginia to northern Georgia, amount, yearly, to the burning over of about four and a half million acres of timber land, and the destruction of about ten billion feet of big timber. Experience in the Western forests has shown that these forest fires, which are even more prevalent and disastrous in New England than in the southern Appalachians, can be controlled by proper supervision and "range" patrol.

Fourth: The flood damage, amounting in one year in the South alone to eighteen million dollars, will be materially decreased. For example, with thirty-five per cent. of the Western forests subject to storage, the flood damage at points like Pittsburgh and Wheeling will be virtually eliminated.

Erosion caused by devastating Floods, a Result of wasteful Deforestation

A RACE ACROSS THE CONTINENT

DRAWN BY NEAL TRUSLOW

Corruption in England

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

THERE was a debate a short time ago in the House of Commons on a subject that for the past three or four years has been one of the chief topics of political discussion in America, and that promises before long to become equally prominent in England. I refer to the question of the party funds and of the secrecy with which they are accumulated and administered. It was Mr. Helios, the cunning writer, who brought the matter before the House. He argued that the present system of raising and distributing campaign funds involved a two-fold peril. In the first place it robbed the electors of some, at least, of their freedom. It gave an excessive influence to a few rich subscribers, and it enabled them to nominate a candidate from motives that were concealed from the mass of the voters. In the second place it warped the initiative of the House of Commons, and made it impossible to apply an wholesome pressure to individual members whose election expenses had been paid for them. No one could suppose that these great sums of money were paid in secret without some expectation of a return for the outlay. Mr. Helios admitted, what I believe to be the fact, that so far there has been very little ground of complaint, and that the instances in which an undesirable pressure has been exercised upon the votes of members of Parliament have been few and insignificant. But he maintained none the less that a system under which an increasing number of politicians depended upon funds secretly subscribed and secretly disbursed for meeting their campaign expenses was one that was liable to grave abuse. He had no particular remedy to propose; his object was mainly to ventilate the question; but he inclined to the opinion that an audit of the funds of all political parties would be a good thing and should take place periodically.

Among those who took part in the debate was Mr. H. C. Lee, the member for East St. Pancras. Mr. Lee has made himself conspicuous by the vigor with which he has attacked the British methods of conferring honors and titles, methods, I quite agree, that are little less than a degrading scandal. In the discussion on Mr. Helios's motion he brought in some exceedingly pointed references to his favorite topic. It was, he declared, a matter of common knowledge and gossip in the House, in the clubs, and among men in the street, that titles and decorations in vogue in this country were as lacking in dignity, prestige, and moral worth as the methods by which they were obtained were fraudulent, corrupt, and nauseous. It was, he continued, notorious in the City that titles and decorations were sold in 1903-05, and it was equally well known what had been the percentage of commission to the introducers. He could instance a case where one particular title fetched as much as \$750,000. From November, 1903, to December, 1905, he found that the Tory party was responsible for 13 Peers, 16 Privy Counsellors, 33 Barons, and 16 Knights—in all, 128 in two years, of which number 26, or 28 per cent, were members of the House of Commons. From December, 1905, to November, 1907, two years of a Liberal régime, the Liberal government were responsible for 20 Peers, 19 Privy Counsellors, 33 Barons, and 95 Knights—in all, of whom 37, or 22 per cent, were members of the House of Commons. That showed, he thought, that many men entered Parliament chiefly with a view to social advancement. He excepted from this charge the members of the Liberal and Labour parties. The House ought to institute an inquiry into the manners and absurdity of the whole traffic in honors with a view to putting an end to it. For himself he would sweep away all titles with as little compunction as a sanitary inspector would deal with a nuisance.

From this exciting point the debate branched off into a review of the electioneering activities of bodies like the Tariff Reform League. These organizations raised large sums for which they rendered no account. They supported candidates at elections with canvassers, posters, leaflets, and so on. They did for a candidate what he was absolutely unable to do for himself on such a scale. But no return of the money they spent was included among the statement of expenses that every candidate is required by law to furnish. In this way the purpose of the Corrupt Practices Act was wholly frustrated. I do not, however, intend to write a complete summary of the debate, but rather to suggest some of the points on which it touched, and to offer certain reflections upon the use of money in English politics. Taken as a whole, public life in this country is remarkably pure. After the last election only five petitions were lodged. One of them turned on technical points; the other four certainly disclosed a large degree of squalid corruption. In Worcester the revelations were so revealing that the city was disfranchised for a couple of years. Like most of the old cathedral towns Worcester's political records for centuries have been more or less tainted, and it came as no surprise to those with

any knowledge of its past when it was proved by the inquiry of 1906 that the hebbable class practically held the balance between the regular parties. At Yarmouth, Maidstone, and Bodmin also a good deal of downright corruption, of votes purchased for money, even for as small a sum as fifty cents, was unearthed. But nobody can question that the absorption or abolition of the old rotten boroughs, the expansion of the electorate, the spread of education, the Corrupt Practices Act, the growth of class consciousness, and self-respect among the working classes, and the generally high standard of character among Parliamentary candidates have pretty well stamped out the grossest forms of bribery in English elections. The lesser and more indirect forms, however, still flourish; and as Mr. P., who is to keep the favor of his constituents finds himself obliged to subscribe with a quite indiscriminate generosity to all the local charities, "movements," and sports. There are scores of Mr. P.'s whose disbursements in this way come to over \$5000 a year.

But if there is little political corruption in England there is a good deal of social corruption, most of it springing from the vicious hunt for titles. In this matter my sympathies are altogether with Mr. Lee. It is possible for any man of wealth by contributing to the party funds to establish a claim for a knighthood, baronetcy, or peerage that sooner or later will be recognized as valid. I do not mean by this that all honors or even most of them go to the highest bidder. But some, and far too many, are unquestionably the outcome of an indefensible cash transaction, and thus vitiate those that are bestowed as the reward of genuine merit. One inevitable consequence of this is the creation of false and therefore of demoralizing values. To such a thing as an Englishman in such a world as England a title will always carry with it an implication of superiority, will command deference, will raise its wearer above the ranks of average humanity. It will do this apart altogether from the grounds on which the title has been given. Nevertheless, the spectacle of wealth buying what honors it pleases, of shrewd donations to a royal charity being rewarded with a peerage, of baronetries purchased by a check to the party funds of all the wretched backstitching and intrigue that graduate the scale of English precedence, is one that works with a subtle and degrading perniciousness. Things are not well with a country that accepts at its face value a system of honors that it knows to be very largely a grotesque and vulgar sham, and that pays all the outward forms of respect to men who admittedly have done nothing to deserve it. Politics do not and indeed cannot escape the taint. The type of man who enters public life as the easiest road to a title is becoming an common in England as he was in Ireland before the union.

There is one form of the abuse of wealth in politics from which England at present is comparatively free. She does not suffer from the problems of corporations in politics. It is a rare thing for a statutory company, such, for instance, as a railway company, or for a joint stock company of any kind, to contribute from its funds to the campaign chests of political parties. The thing is not unknown—there was a case about a year ago in which the directors of one of the great railway companies were found to have subscribed to the Moderate party in the London County Council elections. But on the whole the practice is frowned upon both by public opinion and by the general sense of the commercial community. Nor does the political necessity for it exist in England. The reason, I believe, are mainly given to explain the theory of the alliance between corporations and politics in the United States. The first is that in an expanding, half-developed country the number of good things to be picked up in the way of concessions is beyond comparison greater than in such a land as England. The second reason why the trusts cannot leave politics alone in America is that politics cannot leave the trusts alone; and their action and reaction seem to be enormously intensified and complicated by the American system of government in self-contained compartments. With fifty-fold different governing authorities to placate, to defend itself against, and whose regulations it is bound to observe, an American insurance company or local or railway is more or less forced to make politics a branch of its business. The third reason for the constant intervention of corporations in political campaigns is the American tariff. It has given to political power a money and a money-making value. It has made it financially worth while for great industrial interests to capture parties, houses and conventions. And none of these reasons obtain in England, and one immense source of possible corruption is thus doomed at the fountain head. The evils of secret party funds and of wealthy political organizations that are accountable to no one are, no doubt, potentially serious, but so far they have done little real harm. Far more demoralizing is the universal scramble for honors. If this could be prevented I think that English politics would still maintain for many years their deserved reputation for purity.

One of the Twelve District Plague Stations from which official Ratcatchers are sent out

THE city of San Francisco has declared war upon her rat population, and a force of one hundred men is now employed in setting and handling traps every day throughout the city, as well as in distributing rat poison. This action is inspired by determination to stamp out the bubonic plague. As is well known, every great epidemic of plague in Asia has been ushered in by the death of innumerable rats from the same disease. The medium through which the disease is disseminated is the flea, which is the bane of life in California. By killing off the rats the authorities hope to get rid of the flea pest as well as the plague, which has become endemic in the city. The haunts of the rat population are chiefly in the neighborhood of the wharves.

Poisoning Bread, which is scattered about the Wharves and Seaside Haunts of the Rodents

Setting One of the Thousands of Traps which are scattered about the City

To encourage the populace of San Francisco to assist in the rat war, a bounty of twenty-five cents for each male rat and fifty cents for every female rat is paid to anybody bringing in carcasses. Rats are now being killed at the rate of 2300 a day, and in spite of the innumerable rodent population of the port it is believed that few rats will remain after the flea season opens on April 1. The bodies are labelled and sent to bacteriologists to be examined for evidences of plague. Every rat is carefully dissected, although as a rule only a single infected animal will be discovered among the thousands which pass through the hands of the operators. That the campaign has had good results up to the present is shown by the fact that during the past forty days only two cases of bubonic plague have occurred throughout the city.

SAN FRANCISCO'S WAR ON RATS

Teaching the Army Its Silent Language

By WILLIAM INGLIS

A Heliograph Class

FO all the magic that nowadays invests the art of war none is more marvelous than that employed in the signal service. The ablest warrior that ever lived said truly that an army marches on its stomach, and all the world approved his axiom; yet the eye of the army is quite as necessary as the stomach to its success. They who are strong for the march will be strong for the fight; but how useless is that strength without the eye to see and the voice to tell just where and when to strike. The Signal Corps is the eye and the voice of the army. It sees everything; directs everything. To compare its present wonderful and intricate mechanism with the primitive methods of scouting is to review at a glance the startling development of the art of war. He was the earliest general who first stole unseen through forests primeval and learned the numbers and disposition of a hostile camp so that he might lead his skin-clad warriors to the very point of which they might best dash in with their stone axes and flint-tipped spears. What a history of growth and invention lies between that rudimentary scouting and the hidden eye of the army of to-day, when a battle line is ten miles long, and that general has the greatest chance of success who is best able by means of skilled observers, themselves unseen and using the telegraph, the telephone, and the flight of wireless electric waves, to say where the hardest blow shall fall and to have his command instantly communicated throughout his widespread forces.

The Wireless Station on Bedloe's Island

will upon all the world, the lighting force of the American people may view all things that make for war. So many years ago that the memory of man runneth not back to the same, that bit of America which we generally know as Bedloe's Island or Liberty Island was officially known as Fort Wood. And Fort Wood, New York, it still stands upon the records of the War Department of the United States, although it no longer mounts ordnance for the defense of New York city.

At Fort Wood, which is one of the smallest posts numerically of the United States army, there is situated one of the most important parts of the army—a School of Instruction of the Signal Corps and supply depot for the same. There are never more than 120 men in the school, and at this moment there are only 130, but they are picked representatives from among a body of high average intelligence, and when they leave the school they are not only able to wigwag signals, which the average citizen has idea of their duty, but to build, equip, maintain, and operate telegraph, telephone, cable, and wireless lines of communication as well.

From this school within the last three years signal officers have gone out to every corner of the globe to which the United States army has penetrated. In the Philippines one can find hundreds of graduates from the tight little island which lies at the very threshold of gay New York, yet in sufficiently remote to exclude its pupils from the dazzling temptations of the metropolis. In Cuba other scores of these men have made maps of the country and reestablished telegraph and telephone lines as well as wireless stations. It is due to the efficient service of the Signal Corps that the small number of soldiers now in the island has been able to maintain unbroken the peace established by the large force that suppressed the revolution of 1906. In far Alaska it is the Signal Corps that has blazed trails, broken roads, and built the telegraph lines as vital in the development of the country.

Until the Statue of Liberty was erected a score of years ago, old Fort Wood, once of vital importance in the defense of New York, had been used for years as a magazine for the storage of powder for the forts between Sandy Hook and the east end of Long Island Sound. A small garrison was maintained to guard the magazine. When the Signal Corps moved in a new order of things was begun. The hollow ground about the base of the

pedestal of the Statue of Liberty was all filled in and graded, and the labyrinthine passages beneath the pedestal straightened out and neatly finished. A dozen acres were added by means of filling to the north shore of the island. There was much grading. Hills were laid low and waste places of the beach were raised high with new earth and made into pleasant lawns. Within a few months a complete system of new asphalt walks will be installed. An abundant water supply and a model modern sewerage system are already in use. If any Rip van Winkle in khaki should suddenly return to Fort Wood he would need the help of a guide before he could identify the old place.

All but two of the ancient and jaded wooden houses have vanished, and these two are going as fast as the wreckers can pull them apart. The new houses are the quarters of the commanding officer, the headquarters and principal school building, the hospital, the wireless telegraph building, the school building, and non-commissioned officers' quarters, the property depot, the lower plant, Post Exchange, stable, and storeroom building. The old hospital is so renovated as to be practically new.

And while all this work of reconstruction has been going on quickly on the School of Instruction has been adding steadily every year to the forces of skilled signal operators and telegraphers in the army. In fair weather and foul the men with wigwag flags and heliographs practice for hours with those at the cotting forts down the harbor, while the telegraph, telephone, and wireless telegraph are in constant use. Fort Wood has talked by wireless as far south as Atlantic City, New Jersey, and as far east as Newport, Rhode Island.

In the school of instruction the men are taught how to set up and maintain batteries, dynamo, instruments, etc., how to build and equip telegraph and telephone lines, how to operate telegraph instruments, and to set up and use the switchboards and other intricate apparatus. Part of all the schooling, in its practical application, is the workshop in which the pupils learn how to construct and repair the various instruments. No instrument is too big or too small, too delicate or too complicated, for these men to build or to repair and keep in perfect working order. Hardly a day passes, for example, without practice at splicing and laying cables for submarine telegraphs and telephones.

It often happens that soldiers who have become proficient in the Signal Corps are attracted by offers of big pay into the employ of concerns in commercial life as soon as their enlistment expires. Hundreds have gone that way.

But hundreds more have come in to take their places," says Captain George C. Barnell, commanding Fort Wood. "And the department does not look upon the men who have left the army as having gone out of the service forever. If there should be need of their services they would come back to the last man. They are not only good patriots, but they are grateful to the service whose teaching has enabled them to earn pay much larger than they could command if they had not enlisted in the Signal Corps."

An Instructor teaching the Class in Cable Splicing

PAST, PRESENT, —AND CUPID

A popular feature of the reconciliation between England and her South African subjects was the recent marriage of Miss Marie Botha, the youngest sister of the famous Boer general, who is now Premier of the Transvaal, to Mr. R. C. Barkis, a London barrister and secretary of the "Eighty Club," a prominent Liberal organization. The ceremony took place at the old Dutch church in Austin Friars, London. An interesting feature of the ceremony was an address delivered by Dr. Clifford, the leader of the Nonconformists, to the bride and groom after the wedding.

A QUEEN OF QUEENS IN PARIS

Every year the young women of the wholesale meat and provision markets and landladies of Paris elect a Queen of Queens to reign over the mid-Lent Carnival. On account of their good looks and every conspicuous the landladies, who form one of the most numerous bodies of working girls, have generally secured the office for one of their own number. This year, however, the honor has fallen to a "charcutière," or delicatessen girl, whose name is Mlle. Fernande Marin.

A NEW RELIC OF THE GREAT NELSON

A relic of Nelson has just come to light in the little Scotch village of Kirkpatrick, Dumfriesshire. It consists of the round engined brass box and short trap of plated red-brass hair shown in the photograph. The box apparently lay for many years forgotten at the back of a press in a horse-dealer's cottage, and was discovered by accident when some rubbish was being thrown away. The plate of hair, which is 2.2 inches long, exactly fills the box. Much speculation has been aroused as to how the relic came to be found in this out-of-the-way place, and some doubt as to its authenticity at first arose, but researches which have been made show that a branch of the Nelson family had moved to the manor of Chesham, in which the village of Kirkpatrick lies, at an earlier period, from Norfolk, and it is a fair inference that the piece of hair is that of the great admiral.

· REX BEACH AND "THE BARRIER"

By VICTOR ROUSSEAU

SCENE: a room in a residence on the west side of upper New York. Kayaks and ooniks and angloks and caribou teeth and salmon skin boots and arrows and photographs and fowling pieces and igloos and whale harpoons and walrus tusks upon the wall. Upon the table glasses and ice and Seltzer water and three varieties of booze in bottles. A large man named Rex Beach is seated in an armchair.

You remember *The Spoilers*, one of the "best sellers" of the year—perhaps the best; that powerful Alaskan story wherein strong men make bold gun plays in dance halls, and Vigilantes fight crooks, and the corrupt forces of those in power struggle unscrupulously to snatch the fruits of their toil from those who have dug them from the ground. Developed in the first place from a desire to let the public know the corruption which existed in the Alaskan law courts, it was evolved by the author into a romance of enthralling interest.

Yet in *The Barrier*, Mr. Beach's new novel which has just been published, we have a second story of Alaska as compelling and strong as his first, and vastly superior to *The Spoilers* both in technique and power; woven round a plot which leads the reader from the beginning and makes him both to lay the book aside even when the story is ended.

It is a story of primitive passions, of a great hate and a great love. In Flambeau, the little trading post, Gale, the old trader, dwells with his squaw and the three children. To Flambeau come gold prospectors from all ends of the earth: Remona and Rex Stark, gamblers and desperados, "No Creek" Lee, the luckless miner, and, to preserve order and law, Meade Burrell, a young Kentucky lieutenant, of an old family, in charge of a small detail of soldiers. Burrell loves Necia Gale, the daughter of the old trader, not knowing that she is a "breed," and when she learns that marriage with him would ruin his career she renounces him. There is only one possible solution to the problem, through confession on the part of Gale. The confession is made, but before giving himself up to the law, Gale and Stark, old rivals and enemies, come together in a life and death grapple. But there are gentler characters than these. There is the exquisite portrayal of the girl herself, Necia, the one good woman in the camp, the picturesque Polona Dorset, and the manly young hero, Lieutenant Meade Burrell, both Necia's lovers, nor must one forget the patient figure of Gale's squaw and the youngsters.

"How did you come to write *The Barrier*?" I asked; for the book leaves the impression that the author has drawn largely upon his own experiences.

"Are all these people real?"

"Most of them are," Mr. Beach replied. "Flambeau is in reality Rampart City, the first camp I struck when I went up to the Klondike eleven years ago. Gale is real, and so is the lieutenant, although of course I have invented their histories. 'No Creek' Lee was an old miner, one of the quietest of characters. He never had any luck, and when others made their fortunes he couldn't even find gold upon his claim.

"*The Spoilers* was really only a high-class sensational story," he continued. "I wrote it originally as an exposure of the corrupt judges and lawyers up in Alaska, and I had some difficulty in convincing the editors who published it serially that it wasn't too yellow for their dignified pages. You think *The Barrier* better?"

"Immensely better, in the opinion of all who had compared it with *The Spoilers*, I told him. Surprisingly so, because he had escaped the temptation to produce shoddy work, which a first success so often induces.

"I'm once it ought to be," said Mr. Beach. "I spent eight or nine weeks drafting it, besides the time devoted to rewriting and polishing it up. Lots of people have asked me why I confine my work to Alaskan scenes. I'm going to spread out and do other stories later, of course, but I'm not in any big hurry. I think an author can easily overreach and make a fool of himself if he tries to be too versatile. I've two or three Alaska stories to tell yet; one about the fisheries, in particular. That's an immensely interesting subject, and the local color is quite different from that of the mining camps. I'm going up to Alaska in about eight weeks' time to do some hunting, and, incidentally, to let the theme of my next novel soak into me."

"But, to come back to *The Barrier*, how did you get your material for the old squaw Al-luna?"

"Speaking of squaws," Mr. Beach said, reminiscently, as he toyed idly with an oonikak, "we used to have fine times dancing with them up there. We danced in hotelized boots on the whipsaw boards—the kind that project over each other, you know, so that when you come to the edge of a board you have to reverse. The orchestra usually consisted of two men hitting a fiddle, one with a bow and the other with a couple of straws, which gives the effect of a drum.

"There was Babe, for instance. Babe was a beautiful squaw. She used to dance so gracefully. I didn't think she knew enough to reverse, though, and so, as I said, I used to reverse only when I came to the edge of a board. One night she quit me cold in the middle of the floor. 'Aw! no good dance,' she said. 'Too much one way go.' They're not really known as squaws, but kloteches. Before they're married they're called chloteches.

"They're not at all bad-looking, and the best-hearted creatures. Many a man in Alaska owes his life to the natives who have taken him in and fed and sheltered him. The Eskimos and Siwash are both high-grade Indians."

Mr. Beach seemed pleased to learn that *The Barrier* was considered far better than *The Spoilers*.

"Of course I'm learning right along," he said, modestly. "Just now I'm busy on a play, called 'Going Some,' a four-act comedy of college life and college chaps and all that sort of thing. Of course they don't really wear chaps out West, except when going through scrub, and they never get a chance to bathe, and any man who carried a gun would get arrested; but on the stage things are different. I'm doing this in collaboration with Paul Armstrong, the man that wrote *Antony and Cleopatra*.

(Continued on page 27.)

Rex Beach
AUTHOR OF "THE BARRIER"

The Season's Plays

FROM RUSSIA TO THE HIPPODROME

By "J"

Y far the most striking thing about the new play recently produced by Mr. E. H. Sothern at the Lyric Theatre is its name. This entertainment is founded upon Dostoevski's famous novel, *Crime and Punishment*, and Mr. Laurence Irving acknowledges responsibility for the adaptation. But Mr. Irving has not been content with the simple and effective title of the novel; he has seen fit—why, it would be difficult to say—to encumber it with the following pompous Biblical label: "The Fish Bath Sully: 'There is No God'"—a title which would kill the best play ever written; and Mr. Irving's play is not quite that. It is melancholy to reflect upon the probable size of Mr. Sothern's printing bills, and upon the weariness which must long since have fallen upon those who, being concerned in its production, have had frequently to call it by name. It would throw a not valueless sidelight upon the devious byways of psychology if one could know how such a preposterous title came to be selected.

However, let us to the play. The scenes are laid in Russia; the time is the present. The hero, a student named Rodion Raskolnikov, is afflicted with revolutionary ideas. He is a philosophical anarchist, and he believes that murder is at times justifiable and praiseworthy. When he learns that a penniless and pretty young innocent whom he knows, one *Sonia*, is in peril through the oppressive inhumanity of her landlord, he concludes that the time has come for him to act upon his convictions. He thereupon murders the landlord. The rest of the play is concerned with his endeavor to escape the consequences. He is put through a "third degree" process by a shrewd and implacable magistrate, and escapes actual indictment; but, in the end, *Sonia* converts him to her religious beliefs and he confesses his crime. He is sentenced to a brief term in Siberia, but the audience is led to understand that upon his release he and *Sonia* will modulate into the perfect cadence of conjugal felicity.

It is a pity to have to say it, but whatever may be the merits of Dostoevski's celebrated book, the dramatic relish of which Mr. Irving has made it fat, fascinating, and intelligible, it is too long, it drags in the movement, and it utterly fails to "convince." Rodion's conversion at the end strikes one as altogether facetious—violently improbable; and the concluding scene, in which *Sonia* is made to recite the Lord's Prayer in full, is as offensive as it is ineffective.

It must be said that Mr. Sothern regards upon the part of the unhappy murderer a degree of historic intelligence, which, while it makes a deep impression through its individual intensity, does little to redeem the play. The part of *Bezik*, the magistrate, is likewise well acted by Mr. Adolph Lestlin, and little Miss Zylina (see *Shannon*, as *Katasha*), exhibits a very promising degree of skill and ability. The rest of the cast is moderately capable.

Let us conclude with the observation that Mr. Sothern, in continuing this play, is wasting his time and his talent.

There is no frost at the Hippodrome, but there is unlimited snow. The programme opens with a winter scene at Port Arthur, and closes with a snow carnival. Now "I" know where all the waste paper goes. It is purchased by Shirket agents and cut up into snow-fakes.

In earlier life, when "I" lived upon canned meats cooked

over a hall-bedroom gas flame, "I" once bought something with a picture on the label, called "Angels' Food."—"I" remember it distinctly, by reason of its cosmopolitan flavor; it was, so to say, nothing and everything, because the various compounds were so skillfully blended as to convey the elemental taste of hash. This recollection was brought back startlingly to me when the spectacle was ended. There were elephants and clowns and trained cats, horses and dogs, policemen, soldiers, snore, pigeons, and mules, snow, a chorus of maidens, acrobats, snore, Persian gymnasts, and snore.

The opening spectacle is a lurid two-net hippodrama entitled "The Battle of Port Arthur." Act I. shows us the city square, covered with snow, which is still falling. Crowds in the street are begging for bread, while in the prison yard Japanese captives press the steel bars against their iron frames. Later Captain Fushiko, of the Japanese army. "You are a spy," cries Colonel *Obeg*, commander-in-chief of the garrison. "No," is the reply, "I have come to find *Riska*, the daughter of Colonel *Oekiki*, who was lost while riding with her groom." "And what does she want here?" demands Colonel *Obeg*, as his minions seize the covering maidens. "Bread," replies Captain Fushiko, witheringly, turning on his heel. Suddenly a cannonade is heard. The walls are pierced by shells, the Japanese rush in, and Port Arthur is taken.

Act II. shows us the Russian camp at 263 Metro Hill. Enter Captain Fushiko. "Seize him," cries Colonel *Obeg*; "he is a spy." "No," retorts the captain with withering emphasis, pulling a bag of treasure out of his coat pocket. "I have come for *Riska*, the daughter of Colonel *Oekiki*, who was lost while riding with her groom." "Tell Colonel *Oekiki* to come himself for her." "He will come," replies Fushiko, "and at his back will come the army of Japan." True to his word the army of Japan comes, and, in a furious rain-storm, the whole twenty of them climb the perpendicular fort and capture it. The flying Russians plunge into the lake, to rise no more. *Riska* swoons upon the ramparts, Captain Fushiko mops his face with the flag of truce, and the curtain rises. [It works upside down by the way.]

The second spectacle takes us into the realms of the pastoral. "Lady Gay's Garden Party" is likewise in two acts. The first shows us the cinema with which *Lady Gay* speaks enters, trains her guests, and consists of the usual acrobatic performances and animal tricks: our ancient friend the dancing horse; the dog that swings the pony; and the unwilling ass laboriously evoking diurnal strains through the medium of a hand organ. The best features are the cats and the clown. Cats rush in from the wings and leap into a basket which is suspended from the Port Arthur icicles (still visible at the top of the scenery). When they are safely ensconced the basket is raised, and pigeons, bearing varicolored ribbons in their bills, fly through the air and alight upon the rim, where they settle among their fellow friends. *Marceline*, the clown, whose high rank among his contemporaries is displayed by the white face with a red collar-piece (as honor only accorded to augusts, or clowns of the first grade), is scintillatingly funny, and many of the time-honored jokes take on a new significance under his auspices. Spectacular displays representing the seasons enter the performance.

Music and the Opera

A DELIVERANCE BY MR. REGER

By LAWRENCE GILMAN

IF more one hears of the new music that is being put forth by Germany the stronger grows one's conviction of the paucity of any genuine creative impulse in that country today, with a single commanding exception, and that exception is, of course, the phenomenal Richard Strauss. It is doubtless a little unreasonable to expect

to be able to give in this matter to the amiable lady who told Matthew Arnold that she liked to feel that catholic excellence was "common and abundant." As the sagacious Arnold pointed out, it is not in the nature of aesthetic excellence that it should be "common and abundant"; on the contrary, he observed, excellence dwells among rocks hardly accessible, and a man must almost wear his heart out before he can reach her. All of this is quite unanswerable; yet, so far as musical Germany is concerned, is not the situation rather singular? There are in France to-day at least three men who produce music that is both original and important; in Italy there are two whose individuality is marked; Russia has three music-makers whose artistic profiles are of salient character; contemporary England is, so far as we are concerned, a musical terra incognita, but in these despised United States there is at least one creative musician who is producing work of a commanding quality. Yet Germany—the Germany which yielded the royal line founded by Bach and continued by Mozart, Beethoven, Schubert, Schumann, and Wagner—can show us to-day, save for the productions of the unique Strauss, only such things as the "Tosca" of Mr. Boer, upon which we commented in this place only weeks ago, the pompous and futile symphony by Hermann Bischoff recently performed here under Dr. Meck, and the Variations and Fugue by the much-discussed Max Reger, made known a little later under the same brilliant auspices—which forms the particular text for these number reflections.

It has been remarked before on this page that such enterprise as Dr. Meck has shown, and as other conductors have shown in making known here novelties of a like character, is the kind of enterprise which must be unflinchingly persisted in if we are to avoid stagnation; better, it was said, the disclosure of repeated banalities, than the failure to uncover, through a drowsy complacency, even a minor masterpiece. Therefore it was well that Mr. Reger's piece should have been set before us.

Reger is regarded by many in Germany with sincere veneration. He is held to be not only a master of the architectonics of his art, but a creator of rich inventive powers, a radical in the matter of harmonic effect, a music-maker of pith and learning, altogether a man of mark. Timid souls have gasped at his daring in the use of strange and unprecedented effects, and he has said to have inspired the phillistines and enragé the conservatives by his Olympian disregard of the rules of the game. And yet—and yet—we have listened with infinite respect and incoercible patience to Mr. Reger's latest and (presumably) most justly representative composition, his Variations and Fugue on a theme by Hilber, opus folio, the work played by Dr. Meck and the Boston virtuosi—and we are obliged to confess a complete inability to perceive any reason for the breathless excitement which Mr. Reger's inspirations are alleged to have caused in his native land. These Variations have for their theme a tune by Johann Adam Hilber, and that most dauntless and resourceful of sonnetiers, Mr. Philip Hale, has identified this tune as one from "The Harvest Wreath" (*Der Erntedankes*), an operetta published in 1771. In itself, it

is trivial and unimportant enough, but it has served well as a stalking-horse for Mr. Reger's technical ingenuity, which is truly extraordinary. The several variations which it has germinated are remarkable for their complexity and variety of structure, for the admirable and superbly confident skill with which they are carried through. They have, too, at moments, a certain impressiveness, a certain firmness and dignity of line, which make their effect. But of the originality, the harmonic fervor, the ruthless and iconoclastic innovations which we had been led to expect from Mr. Reger there is not a trace. This music roars very gently indeed, and it is almost as innocent of new and pregnant ideas as, in its own day, was the music of the lamented Hilber. It is devoid of anything which approaches beauty of a conventional and wholly normal kind, and it is, as has been said, extremely ingenious—masterly, indeed—in *facture*. But that, alas, is not the end of the praise with which one had hoped to greet Mr. Reger's deliverance.

The demand for new roles to serve the purposes of Mrs. Tetrazzini at the Manhattan has led Mr. Hammerstein into fields strange to the contemporary opera-goer. Almost a quarter of a century ago the immortal Patti appeared at the Academy of Music as *Amelia* in the Ricci brothers' comic opera, "*Crispino e la Comare*," called in English "*The Cobbler and the Fair*." Since then this work had passed, as it seemed, into the spacious limbo where dwell so many successes of operatic yesterdays. Mr. Hammerstein probably did wisely in reviving it—at least, the action will seem wise so long as he has at his disposal a singer so brilliantly facile and with so true a sense of comedy as Mrs. Tetrazzini, though the part gives her fewer opportunities than do several of the other operas in which she has been heard here.

The "book" of "*Crispino e la Comare*" is by the indefatigable Fiave, who supplied Verdi with the libretto of certain of his lyric melodramas. Crispino, and Amelia, his wife, are a luckless, penniless, Venetian couple, with a large family. Crispino endeavors to earn his bread as a cobbler, while his spouse peddles songs and ballads to the streets; but they are both equally unsuccessful.

They are threatened by their landlady, *Asdrubale*, with a distraint for rent. Crispino, driven wild by despair, resolves to put an end to his woes by throwing himself into a well. He is just about to fulfill his rash intention when a Fairy rises from the water and bids him take heart, for she will benevolently protect him and provide for him. She proceeds to inform him that, in order to carry out a certain "speculation" of her own, she intends forthwith to make an "illustrious Doctor" of him; adding that, whenever he visits a patient, he must be careful to look around and note whether she be present (though invisible to all save Crispino), for in that case the patient will die; but should she not make her appearance, the sufferer will surely recover.

Crispino, through the supernatural agency of the Fairy, performs several marvellous cures, and accumulates riches beyond his fondest dreams. But his new-found grandeur makes him haughty and supercilious. As a punishment for his arrogance, the Fairy causes him to sink through the earth to her subterranean abode, where she informs him that his last four is at hand. He persuades her to spare his life, and promises that he will show himself an exemplary husband and father.

The opera, though it is far from being musically distinguished, is entertaining, and it is well and spiritedly performed at the Manhattan.

A Spirit in Prison*

A Novel

By Robert Michens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER IV

THE Antico Giuseppe, Artiole left the boat from the islet and, taking another, was rowed towards the public gardens of Naples, whose trees were faintly visible far off across the bay. Usually he talked familiarly to any Neapolitan with whom he found himself, but to-day he was taciturn, and sat in the stern of the broad-bottomed craft, looking towards the city in silence, while the boatman plied his oars. The memory of his conversation with Hermione in the Grotto of Virgil, of her manner, the look in her eyes, the sound of her voice there, gave him food for thought that was deep and serious.

Although Artiole had an authoritative, and often an ironical, manner that frightened timid people, he was a man capable of much emotion and of great loyalty. He did not easily trust or easily love, but in those whom he had thoroughly proved he had a confidence as complete as that of a child. And where he placed his complete confidence he placed also his affection. The one went with the other almost as inevitably as the wave goes with the wind.

In their discussions about the emotion of the heart Artiole had spoken the truth to Hermione. As he had grown older he had felt the influence of women less. The pleasure of sentiment had been gradually superseded in his nature—or so at least he honestly believed—by the purely intellectual pleasures. More and more completely and contentedly had he lived in his work, and in the life of preparation for it. This life could never be narrow, for Artiole was a traveller, and studied many lands.

In the years that had elapsed since the tragedy in Sicily, when the husband of Hermione had met his death suddenly in the sea, almost in sight of the home of the girl he had betrayed, the fame of Artiole had grown steadily. And he was jealous of his fame almost as a good woman is jealous of her honor. This jealousy had led him to a certain selfishness of which he was quite aware—even to a certain lawlessness such as he had hated in Hermione. Those who strove, or seemed likely to strive, to interrupt him in his work, he pushed out of his life. Even if they were charming women he got rid of them. And the fact that he did so proved to him, and not improbably to them, that he was more wrapped up in the gratification of the mind than in the gratification of the heart, or of the body. It was not that the charm of charming women had ceased to please him, but it seemed to have ceased really to fascinate him.

Long ago, before Hermione married, he had felt for her a warm and intimate friendship. He had even been jealous of Maurice. Without being at all in love, he had cared enough for Hermione to be jealous. Before her marriage he had looked forward in imagination down a vista of long years, and had seen her with a husband, then with children, always more definitely separated from himself.

And he had seen himself exceptionally alone, even almost miserably alone.

Then fate had spun tragedy into her web. He had nearly died in Africa, and had been nursed back to life by this friend of whom he had been jealous. And they had gone together to Sicily, to the husband whose memory Hermione still adored. And then had followed swiftly the murder, the murderer's departure to America, saved by the silence of Gaspare, and the journey of the bereaved woman to Italy, where Artiole had left her and returned to France.

Once more Artiole had his friend, released from the love of another man. But he wished it were not so. Hermione's generosity met with a full response of generosity from him. All his gentleness and selfishness dropped from him then, shaken down like dead leaves by the tempest of a genuine emotion. His knowledge of her grief, his understanding of its depth, brought to him a sorrow that was keen, and even exquisitely painful. For a long while he was preoccupied by an intense desire to revenge it. He strove to do so by acting silent in defiance of his nature, by feigning deception. From the Abbezzo Hermione had written him letters, human documents—the tale of the suffering of a woman's heart. Many reserves she had from him and from every one. The most intimate agency was for her alone, and she kept it in her soul as the priest keeps the Sacred Host in his tabernacle. But some of her grief she showed in her letters, and some of her desire for comfort. And, without any definite intention, she indicated to her subtle and devoted friend the only way in which he could console her.

For once, driven by his emotion, he took that way.

He allowed Hermione to believe that he agreed with her in the conception she had formed of her husband's character and of her husband's love for her. It was difficult for him to do this, for he had an almost cruel passion for truth, and generally a clear insight into human character. For less than many others would have condemned him to be, in his mind, condemn the man who was dead for the sin against love that he had committed. He had understood Maurice as Hermione had not understood him, and knowledge is full of pardon. But though he could pardon easily he could not easily pretend. By pretending he aimed against himself, and helped his friend some steps along the way to peace. He thought he had helped her to go much further along that way than she had gone. And he thought that Vere had helped her too.

Now the hollow outcries of the rock in Virgil's Grotto seemed to be in his heart, as he realized how permanent was the storm in Hermione's nature. Something for her he had done. And something much more, no doubt, Vere had done. But how little it all was!

The helplessness gave to him a new understanding of women. Hermione had allowed him great privileges, had allowed him to protect her, had taken his advice. After Vere was born she had wished to go back again to Sicily. The house of the priest, where she had been so happy, and so sad, drew her. She longed for it. She desired to make it her home. He had fought against her in this matter, and had been aided by Gaspare.

There had been a subtle understanding, never expressed, between the boy and him.

Artiole had played upon her intellect, had appealed, too, to her mother's heart.

He had not urged her to try to forget, but he had urged her not morbidly to remember. He had tried to cheer her and to foster the memory of the tragedy which had broken her life. To go back to that tiny home, solitary in its beautiful situation, in the changed circumstances which were hers, would be, he told her, to court not to summon sorrow. He was even cruel to be kind. When Hermione combated his view, asserting his that to her Mrs. Amato was like a secret place, in place hallowed by memories of happiness, he recalled the despair in which that happiness had ended. With all the force at his command, and it was great, he drew the picture of the life that would be in comparison with the life that had been. And he told her finally that what she wished to do was morbid, was unworthy of her strength of character, was even wicked now that she was a mother. He brought before her mind those widows who make a cult of their dead. Would she be one of them? Would she steep a little child in such an atmosphere of memories, casting a young and tender mind backward into a cruel past instead of leading it forward into a joyous present? Maurice had been the very soul of happiness. Vere must be linked with the umbrellas. With his utmost subtlety Artiole described and traced the effect upon a tiny and sensitive child of a mother's influence, whether for good or evil, until Hermione, who had a deep reverence for his knowledge of all phases of human nature, at last, in despite of the truth which he, of the interior voice which said to her, "With you and Vere it would not be so," caught alarm from his apparent alarm, drew distrust of herself from his apparent distrust of her.

Gaspare, too, played his part. When Hermione spoke to him of returning to the priest's house, almost wildly, and with the hot energy that Laura so readily up in Sicily, he begged her not to go back to the underlife zone in which his padrone's dead had lain. As he spoke a genuine fear of the cottage came upon him. All the latent superstition that dwells in the contadino was stirred as dust by a wind. In clouds it flew up about his mind. Fear looked out of his great eyes. Dread was eloquent in his gestures. And he, too, referred to the child, the poor little Jean-Kins. It would cost ill-luck on the child to bring her up in a chamber of death. Her saint would forsake her. Her too would die. The boy worked himself up into a fever. His face was white. Drops of sweat stood on his forehead.

He had set out to be desperate—that he would have called as gaspare as he had even deceived himself. He knew that it would be dangerous for his padrone to live again near Maurice. Any day a chance scrap of gossip might reach her ears. In time she would be certain almost to hear something of the dead padrone's close acquaintance with the dwellers in the Casa del Signore. She would question him, perhaps. She would suspect something. She would inquire. She would search. She would find out the hidden truth. It was this fear which made him agree on the same side as Artiole. But in doing so he caught another fear from his own words. He became really natural, really truthful in his fear. And—he surely knew why—Hermione was not

more governed by him than by Artois. He had lived with them in the Casa del Prete, been an intimate part of their life there. And he was Sicilian of the soil. The boy had a real power to move, to dominate her, which he did not then suspect.

Again and again he repeated those words, "*La povera biondia — la povera povera biondia.*" And at last Hermione was overcome.

"I won't go to Sicily," she said to Artois. "For if I went there I could only go to Monte Amato. I won't go until Vere is old enough to wish to go, to wish to see the house where my father and I were happy."

And she had never gone back. For Artois had not been satisfied with this early victory.

In returning from a tour in North Africa the following spring, when Vere was nearly two years old, he had paid a visit to Marchiaro, and, while there, had seen the contadino from whom Hermione had rented, and still rented, the house of the priest. The man was middle-aged, ignorant but shrewd, and very greedy. Artois made friends with him, and casually, over a glass of *moscato*, talked about his affairs and the land question in Sicily. The peasant became communicative and, of course, laid in his complaining. His land yielded nothing. The price of almonds had gone down. The lemon crop had been ruined by the storms. As to the vines—

they were all devoured by the phylloxera, and he had no money to buy and plant vines from America. Artois listed that he received a good rent from the English lady for the cottage on Monte Amato. The contadino, taken aback, that he received a fair price for the cottage and the land about it; but the house, he declared, would go to rack and ruin with no one ever in it, and the land was lying idle, for the English lady would have everything left exactly as it had been when she lived there with her husband. Artois seized upon this hint of what was in the peasant's mind, and began to talk with him about his situation. The house ought to be occupied, the land all about it, up to the very door, and belied upon the sunny mountainside, planted with American vines. If it belonged to him that was what he would do—plant American vines, and when the years of yielding came, give a good percentage on all the wine made and sold to the man who had tilled the vineyard.

The peasant's love of money awoke. He only let the cottage to Hermione year by year, and had an contract with her extending beyond a twelve months' lease. Before Artois left Marchiaro the tender treachery was arranged. When the year's lease was up, the contadino wrote to her declining to renew it. She answered, protesting, offering more money, but it was all in vain. The man replied that he had already let the cottage and the land around it to a grover of vines for a long term of years, and that he was getting double the annual price she offered.

Hermione was indignant and bitterly distressed. When this letter reached her she was at Fiesole with Vere in a villa which she had taken. She would probably have started at once for Sicily; but Vere was just then ill with some infantile complaint, and could not be left. Artois, who was in Rome, and had received from her the news of this carefully arranged disaster, offered to go to Sicily on her behalf—and actually went. He returned to tell her that the house of the priest was already occupied by contadini, and all the land up to the very door in process of being dug up and planted with vines. It was useless to make any further effort. The thing was done.

Hermione said nothing, but Artois saw in her eyes how heavily she was suffering, and turned his own eyes away. He was only trying to preserve her from greater unhappiness, the agony of ever finding out the truth; but he felt guilty at that moment, and as if he had been cruel to the woman who roused all his tenderness, all his protective instinct.

"I shall not go back to Marchiaro now," Hermione said. "I shall not go back even to see the grave. I could never feel that anything of his spirit lingered there. But I did feel, I should have felt again, as if something of him still loved that little house on the mountainside, still stayed among the oak trees. It seemed to me that when I took Vere to the Casa del Prete she would have learned to know something of her father there that she could never have learned to

know in another place. But now—no, I shall not go back. If I did I should even lose my memories, perhaps, and I could not bear that."

And she had not returned. Gaspare went to Marchiaro sometimes, to see his family and his friends. He visited the grave and saw that it was properly kept. But Hermione remained in Italy. For some time she lived near Florence, first at Fiesole, later at Bellaguarda. When the summer heat came she took a villa at the Abetone. Or she spent some months with Vere beside the sea. As the girl grew older she developed a passion for the sea, and seemed to care little for the fascination of the pine forests. Hermione, noting this, gave up going to the Abetone, and took a house by the sea for the whole summer. Two years they were at Santa Margherita, one year at Sorrento.

Then, sailing one evening on the sea towards Bagnoli, they saw the house on the inlet beyond the Piod di San Francesco. Vere was enchanted by it.

"To live in it," she exclaimed, "would be almost like living in the sea."

Hermione, too, was fascinated by its situation, the loneliness, the wildness, yet the radiant cheerfulness of it. She made inquiries, found that it was owned by a Neapolitan who scarcely ever went there, and eventually succeeded in getting it on a long lease. For two years now she and Vere had spent the summer there.

Artois had noticed that since Hermione had been in the Casa del Mare an old desire had begun to revive in her. She spoke more frequently of Sicily. Often she stood on the rocks and looked across the sea and he knew that she was thinking of those beloved coasts—of the luscious water, of the blossoming almond trees among the olives and the rocks, of the scarlet geraniums glowing among the thorny cactus, of the giant watercourses leaping up into the mountains. A longer was awake in her, now that she had a home so near the enchanted island.

He realized it. But he was no longer much afraid. So many years had passed that even if Hermione visited Marchiaro he believed there would be little or no danger now of her ever learning the truth. It had never been known in the village, and if it had been suspected, all the suspicious must have long ago died away. He had less successful in his protection. He was shocked that it was the one thing he had been able to do for the friend who had done so much for him.

The tragedy had occurred because of him. Because of him all knowledge of it had been kept from Hermione, and would now be kept from her forever—because of him and Gaspare. This he had been able to do. But how powerless he was, and how powerless was Vere!

Now he looked vaguely at the villas of Posillipo, and he realized this thoroughly.

Something for her he had done, and something Vere had done. But how little it all was!

To-day a new light had been thrown upon Hermione, and he realized what she was as he had never realized it before. No, she was right. She could never live fully as a girl child—she was not made to do that. Why had he ever thought, hoped that perhaps it might be that perhaps Vere might some day completely and happily fill her life? Long ago he had encouraged her to work, to write. Misled by her keen intelligence, her enthusiasm, her sincerity and vitality, by the passion that was in her, the great heart, the power of feeling, the power of criticizing and inspiring another which she had freely shown to him, Artois had believed—as he had once said to her in London—that she might be an artist, but that she preferred to be simply a woman. But he found it was not so. Hermione had not the peculiar gift of the writer. She could feel, but she could not arrange.

She could discern, but she could not expose. A flood of words came to her, but not the inevitable word. She could not take that exquisite leap from the known into the unknown which genius can take with the certainty of alighting on firm ground. In short, she was not formed and endowed to be an artist. About such matters Artois knew only how to be sincere. He was sincere with his friend, and she thanked him for being so.

One possible life was taken from Hermione, the life of the

"It is the greatest mistake in the world to bother about to-morrow's mischance!"

artist who lives in the life of the work.

There remained the life in Vere. To-day Ariola knew from Hermione's own lips that she could not live completely in her child, and he felt that he had been blind as men are often blind about women, are blind because they are secretly selfish. The man lives for himself, but he thinks it natural, even distastefully womanly, that women should live for others—for him, for some other man, for their children. What man finds his life in his child? But the woman—she surely ought to, and without difficulty. Hermione had been sincere to-day, and Ariola knew his blindness, and knew his secret selfishness.

The gray was lifting a little over Naples, the distant shadowy form of Vesuvius was becoming clearer, more firm in outline. But the boatman rowed slowly, influenced by the seclusion.

How, then, was Hermione to live? How was she to find happiness or peace? It was a problem which he debated with an order that had in it something of passion. And he began to wonder how it would have been if he had acted differently, if he had allowed her to find out what he suspected to be the exact truth of the dead man. Long ago he had saved her from suffering. But by doing so had he not dedicated her, not to a greater, but to a longer suffering? He might have deduced a beautiful memory. He must have done so had he acted differently. But if he had deduced it, might not Hermione have been the subject of a grosser revelation? Horror can kill, but it can also cure. It can surely root out love. But from such a heart as Hermione's?

Despite all his understanding of women, Ariola felt at a loss to-day. He could not make up his mind what would have been the effect upon Hermione if she had learned that her husband had betrayed her.

Presently he left that subject and came to Vere.

When he did this he was conscious at once of a change within him. His tenderness and pity for Hermione were replaced by another tenderness and pity. And those were wholly for Vere. Hermione was suffering because of Maurice. But Vere was surely suffering, subconsciously, because of Hermione.

There were two links in the chain of suffering, that between Maurice and Hermione, and that between Hermione and Vere.

For a moment he felt as if Vere were betrayed, were motherless. The sensation passed directly he realized the exaggeration in his mind. But he still felt as if the girl were deprived of something which she ought to possess, which, till now, he had thought she did possess. It seemed to him that Vere stood quite outside of her mother's life, instead of in it, in its centre, its core; and he pitied the child, almost as he pitied other children from time to time, children to whom their mothers were indifferent. And yet Hermione loved Vere, and Vere could not know what he had only known completely to-day—that the mother often felt lonely with the child.

Vere did not know that, but surely some day she would find it out.

Ariola knew her character well, knew that she was very sensitive, very passionate, quick to feel and quick to understand. He discovered in her qualities inherited both from her father and her mother, attributes both English and Sicilian. In appearance she resembled her father. She had "thrown back" to the Sicilian ancestor, as he had. She had the southern eyes, the southern gaze, the southern vivacity and warmth that had made him so attractive. But Ariola divined a certain subtleties in Vere that had been lacking in the dead man, a subtleties that took its rise not in stupidity but in a secret consciousness of force.

Vere, Ariola thought, might be violent, but would not be feeble. She had a loyalty in her that was Sicilian in its fervor, a sense of gratitude such as the comrade have, although by many it is denied to them; a quick and lively temper, but a disposition that responded to joy, to brightness, to gaiety, to sunlight, with a vivacious, almost a serene, that was entirely non-English.

Her father had been the dancing fawn. She had said, could never have his gift of thoughtfulness. For she had intellect, derived from Hermione, and an odd trustfulness that was certainly non-Sicilian. Often there came that Ariola called "Northern Light" in her sincerity. The strain in her, united, made, he thought, a

Shutting his eyes for a moment as if to ward off some dreadful vision

fascinating blend. But as yet she was undeveloped—an interesting, a charming child, but only a child. In many ways she was young for her age. Highly intelligent, she was anything rather than "knowing." Her innocence was like clear water in a spring. The gracefulness of youth was hers to the full.

As Ariola thought of it he was conscious, as of a new thing, of the wonderful beauty of such innocent youth.

It was horrible to connect it with suffering. And yet that link in the chain did exist. Vere had not something that surely she ought to have, and without consciously missing it, she must sometimes realize, perhaps vaguely, be aware that there was a lack in her life. Her mother gave her great love, but she was not to her mother what a son would have been. And the love that is mingled with regret has surely something shadowy in it.

Maurice Delaney had been as the embodiment of joy. It was strange that from the faintest of joy sorrow was thrown up. But so it was. From him sorrow had come. From him sorrow might still come, even for Vere.

In the white and silent day Ariola again felt the stirring of intuition, as he had felt it long ago. But now he roused himself, and resolutely, almost angrily, detached his mind from its excursions towards the future.

"Do you often think of to-morrow?" he suddenly said to the boatman, breaking from his silence.

"Sigher?"

"Do you often wonder what is going to happen to-morrow, what you will do, whether you will be happy or sad?"

The man threw up his hand. "No, signore. Whatever comes is destiny. If I had food to-day it is enough for me. Why should I bother about to-morrow's maccheroni?"

Ariola smiled. The boat was close in now to the round platform of stone that projected beneath the wall of the Marina.

As he stepped out he gave the boatman a generous huomano. "You are quite right, comrade," he said. "It is the greatest mistake in the world to bother about to-morrow's maccheroni."

CHAPTER V

THREE days after Ariola's conversation with Hermione in the Grotto of Virgil the Marchese Indro Fanciulli came smiling to his friend's apartments in the Hotel Royal des Etrangers. He was smartly dressed in the palest possible shade of gray, with a bright pink tie, pink socks, brown shoes of the rather bottle-like shape affected by many young Neapolitans, and a round straw hat, with a small brim, that was not slightly on the side of his curly head. In his mouth was a cigarette, and in his buttonhole a pink carnation. He took Ariola's hand as he left the boat, squeezed it affectionately, murmured, "Caro Emilio," and sat down in an easy attitude on the sofa, putting his hat and stick on a table near by.

It was quite evident that he had come for no special reason. He had just dropped in, as he did whenever he felt inclined to gossip with "Caro Emilio," and it never occurred to him that possibly he might be interrupting an important piece of work. The Marchese could not realize work. He knew his friend published books. He even saw him sometimes actually engaged in writing them, pen in hand. But he was sure anybody would be rather sit and chatter with him, or tear him play a value on the piano, or a bit of the "Bok-wa," than bend over a table all by himself. And Ariola always welcomed him. He liked him. But it was not only that which made him complaisant. Doro was a type, and a singularly perfect one.

Now Ariola had drawn his pen, and pulled forward an armchair opposite to the sofa.

"Non Doro, Doro! How fresh you look, like a fish just pulled out of the sea!"

The Marchese showed his teeth in a smile which also shone in his round and bonny eyes.

"I have just come out of the sea. Papa and I have been bathing at the Eldorado. We swam round the 'Cicello until we were opposite your windows, and saw, 'Punchelli, fanticelli!' in the

(Continued on page 20.)

Books and Bookmen

(Continued from page 20.)

"It's interesting, breaking into this play-writing business," he confided. "They say that there's more money in it than in writing a novel, but a successful novel brings in from \$25,000 to \$75,000, and it takes a pretty good play to make that much. When you write a book, the publisher is supposed to give all the credit to the author, but the play manager only seems to observe himself. Most people in the writing game are weak enough to want some credit for it. I suppose there is some sort of credit in it. I wonder how much a publisher makes out of a successful play?"

"How did you come to get into Alaska?" I parried.

"I went up with the first rush in '07. I'd been studying law at the Chicago Law College, with the intention of joining my brothers, who have a practice in that city. Then the gold rush came and I hiked out there. I took my chances at anything that came along, riding wood for stambucks and any odd thing. I was a big husky, and it was always easy to get a job that would keep me alive. Then I went up in Nome with a dredge, and I got hold of some good property there."

"I did all kinds of things. Whenever people wanted a job done that nobody else would handle, they'd take a look at my back and ask it to do it. By the way, I first broke into playwriting up there. It was a local comedy which took me four days to write. I first got an agreement with the power dance hall owner who produced it that if the first act went off well I was to receive the money immediately after, or the rest wouldn't be given. Then I hiked off to the Arctic Brotherhood. That's a mighty strange secret society all over Alaska—a cross between the Elks and Masons, I should say. I told the Arctic chief to bring a bunch down to meet for me. Say! you ought to have seen them. They roared and stamped and tore up the benches, and I got my money all right, but just as the second act began the show was broken up by a dog fight."

"You see, when the miners come in to town they leave their dogs in the town room. Dogs up there are worth from \$75 to \$100 apiece, so naturally as soon as two get to fighting their owners rush out and start battering them about the head to prevent them biting each other in the foot. Well, there was a full house dog fight back in the town room that evening, and that burst up the show."

"I used to sing when I was in the camps. My partner and I became the most popular people round there because of our musical gifts, and we organized a regular orchestra. We had a deal of lorgnettes and an awful tenor, and they only sang our song, which began, 'I would that my love.' It was very amusing when they began to sing. The tenor would strike his bedrock tone, and the deaf man would bend down until he caught it and then let his lorgnette fly. He was always a little bit behind the tenor, because he had to watch his partner's lips to know where he was singing."

"He told me many such stories as we sat there beneath the kayaks and comacks and beds of salmon-skin and wolverine skins. But of Flannahan and the mining camp that was born there, of old man Gable and his enemy Stark, of the originals of Nevie and the devoted Poleson, the two great characters of *The Barrer*, I could learn little. Perhaps upon such subjects he reserves himself best toward the medium of his books."

Senate Agreements

To persons who follow the doings of Congress few announcements mean more than one which reads something like this: "The Senate has agreed to vote on the full act Thursday, the tenth, at three o'clock." If the measure is one that has long attracted the attention of the country the statement means that its Senatorial battle is over; that on the day named advocates and opponents will answer to the roll call, and the majority will prevail. It is usually

known in cases where there has been serious debate and considerable delay that the bill will pass when it reaches a vote.

The importance of a simple agreement to vote reveals the theory of procedure in the United States Senate. No majority, no presiding officer, and no committee can determine the date for a vote. The consent of all the Senators is requisite. The least important man on the minority side is thus assured of the fullest opportunity to discuss any measure. In return for this courtesy it is understood that no bill for which a majority actually desires to vote shall be killed by delay. There are thus two sides to the "Senatorial courtesy" of which we hear so much—a concession to the individual, and a deference to the will of the known majority.

Making It Clear

A COLLEGE professor, in company with his son, was enjoying a walk in the country, when he met an old farmer. It had been a very wet season, and the professor, thinking to start the conversation in a way that would prove interesting to the farmer, remarked:

"There has been a rather abnormal precipitation of late."

The farmer seemed somewhat embarrassed, and the professor's son, who used a different vernacular, though he was a student in the college to which his father was attached, attempted to straighten out the matter. Drawing the farmer to one side, he said in a superior way:

"The governor means that we've been having a hell of a lot of rain."

A Presentiment

Sue has married for love, and her wedding is o'er;

And the clothes that she never will need

any more.

That she would not take with her and never

would wear.

Now her mother folds up with the tender

care.

Perhaps there are tears that fall into the

fold,

For the wise mother's heart a presentiment

holds

That her daughter, enlightened, ere six

months have passed

Will have cause to send back for the clothes

she discarded.

GEORGE BURNETT.

The Wrong Tense

DOROTHY's father was sitting before a window in his country home with Dorothy on his knees. He was looking across the fields with unseeing eyes, when the lassie broke in on his reverie with, "What are you looking at, papa?"

"I was looking into the future, my dear."

"The future, papa! I thought it was into the pasture!"

Britain's New Patent Law

ENGLAND has adopted a new patent law under which all articles patented must be produced in that country or the patent will be cancelled. This is due to Mr. Lloyd George, the President of the Board of Trade, and has already produced a remarkable stimulus to certain trades. It is a distinctly and clearly worded act, and there is no escaping from it. Every patent granted within the limits of the British Isles will have to be worked there. Further, the act is retrospective, and all owners of patents taken out in 1904 and before that date will by the 28th of August this year be compelled to show cause why they should not be made to work their manufactures in that country. Great Britain has granted something like 3000 patents to foreigners. Many

of these are not worth much, but a large number are very valuable.

It is rumored that a large American machinery firm has representatives now in England looking for suitable land for the purpose of manufacturing all the tools for which they have British patents. Another American firm holding British patents for safety razors will in a few months be finishing work for 5000 blades at Sheffield. Another company has bought land in London, and all this in four weeks time. One can already compute that 10,000 additional working people will be directly employed twelve months hence as a result of the patented patents act.

Finally, when all these patents lapse England will have definitely established concerns ready to continue the industries. The new act, unlike its preceding ones, is so definitely and clearly worded that there are no loopholes to afford escape from it. The industries about to be created will become British industries.

Not Exactly

"Time is money."

"Hard times aren't."

The Omen

MR. NEWTOWN: "But, my love, why are you weeping?"

MRS. NEWTOWN: "Oh, John, John! I just peeped into the kitchen and saw that cook has on her travelling gown."

A Chicago Tragedy

"Why does that tall woman over in the corner look so sad?"

"Because she can't get a divorce."

"Why can't she get one?"

"She's not married."

JOINING THE WORLD'S LARGEST CANTILEVER BRIDGE

IT IS NOW POSSIBLE TO CROSS THE EAST RIVER BETWEEN UPPER NEW YORK AND THE LONG ISLAND SHORE BY MEANS OF THE NEW BLACKWELL'S ISLAND BRIDGE. THE LAST GAP IN WHICH WAS RECENTLY SPANNED BY A NARROW STEEL PATHWAY. THE SPAN OF THE BRIDGE, THE LARGEST CANTILEVER STRUCTURE IN EXISTENCE, WILL BE 8230 FEET, AND IT WILL CARRY A DOUBLE DECK.

THE APOLOGY OF A DICTATOR

SENIOR JOAO FRANCO, the Portuguese dictator, whose measures of repression were the direct cause of the assassination of King Carlos and the Crown Prince, has explained the motives which actuated him to the correspondent of an Italian newspaper. Senhor Franco fled from Portugal almost immediately after the tragedy, and has since then been wandering through the west of Europe, moving from city to city, steering clear of conspirators who are believed to be trailing him.

"I am here in exile," said Franco. "The work to which I had dedicated my life and all my strength was destroyed by the blood-thirsty act of a few unfortunate madmen. The fate of man conceals ferocious stupidities! The shots that killed the King and the Crown Prince struck me also. I died with my friends, just at the time when I was sure that my life was useful to my country. . . .

"But I must not talk about it! The future will either vindicate or condemn me. Let it condemn me if my dis-grace can help my country. My duty to my country seals my lips. I have no right to defend myself; my words might trouble the work of my co-workers. My country is in need of peace, and I had hoped to give it both peace and grandeur. Portugal is a little country, but she may still be great. I thought that I had a great work to do, but destiny willed that I was not to do it. I have come away, but I have no right to talk or to do anything to disturb the work of the people who stand to-day where I stood yesterday."

"Your enemies will say that you cannot find anything to excuse your acts; they will say that their accusations are true and that you cannot deny them," it was urged.

"Well, and if they do? Who do I serve except myself and my own interests if I defend myself? And after all what difference does opinion make when a man knows the truth? The result is the only thing that counts in the work of the statesman. If he succeeds he is a hero; if he fails he is an adventurer—and more than one great victory has been the work of chance. Last July, when the special envoys of the great European journals came to Portugal to look into the condition of the country, they were transmitters in their spontaneous expressions of sympathy and in their indorsement of my governmental work. When their opinion was known, all the Portuguese journals unfavorable to me attacked me with extraordinary ferocity, and so they attacked the foreign journals. They said that I had defamed my country to justify my work and so "put myself upon a pedestal to foreign eyes."

"If I should talk now they would again accuse me of slandering

my native land. They begged me to come away; they said that my leaving the country would make it easier to establish peace. I promised them that I would go, and so I went. I want to keep to the spirit of my promise; I do not wish to interfere with them in any way, and I will say nothing but this: all that the newspapers said about my relations at court being strained is false. Until the moment of my departure I received nothing but proofs of cordiality. I will affirm one thing more; they say that the assassination was provided by my dictatorship. That is false. The crime was committed when it was known that my dictatorship had ended. That is proved by the fact that my decree of November fixed the election for the month of April. We were in the midst of electoral preparation when the crime was accomplished."

"But the decree abolishing parliamentary immunity was promulgated only two days before the assassination; they say that it was that decree which filled the cup to overflowing."

"In such events they always say that the last act of the government was the cause. I will tell you why I promulgated that decree, although the Chamber had been dissolved since May. I did it because of the crimes against the safety of the state. I did it after I discovered that there were Deputies—members of the Chamber of Deputies—among the conspirators who organized the revolutionary attempt of January 28, which failed only because the army was faithful to the King."

"So there was a revolutionary movement among the population?"

"No, not among the population; among the politicians. It was not a movement strong enough to effect a revolution, but it was a menace; it was strong enough to be dangerous; strong enough to bring about much trouble. I knew that if I did not warn the conspirators I should be forced to suppress them later on. My decree had but one meaning—prevention. I wanted it to have across the frontier of Portugal men who I knew were dangerous to the state. But, I beg of you, do not make me say things that I do not want to say and that I must not say! I have said too much."

"What are your future plans?" the ex-dictator was asked.

"I do not know. I must have advice. As far as I am personally concerned I care for nothing but my country's peace. But it seems to me that my own needs the life of a city. He had studied law three years; he remonstrated that by the wish of his mother. I want him to perfect himself in foreign languages. I want him to live with his fellow creatures, to live in the common life, to make friends and to be a friend. In a short time he will be twenty-one years old. Young people need companions; they ought to live among people of their own age."

Franco was silent, repressed in thoughts of his son's future.

A Merry Throat Within Mother's Hearing. The

Health Merry-Go-Round

before the children's excitement and enthusiasm for hours together at the same time furnishing much amusement.

It is a real Merry-Go-Round, with a real organ that will play over time. The children do the jumping with an easy forward and backward swing that gives exercise every nearly, develops the lungs, strengthens the back and strengthens the limbs. It gives the motion of going without the danger of most swings, since the little figure swings from the arms of the structure, instead of away from them, and the gentle of the arms, instead of sudden, makes those popular with their mothers. There is no danger, no strain even in rainy days. Each Health Merry-Go-Round has four wonderful gifts.

Not a toy for a few days—it will last for years. Built substantially of iron, steel and seasoned hard wood. Handsomely painted in black and red. Organ has three true changes, and may be had any time—a good discount, nearly made, an ornament to grounds and shelter from sun and rain.

A father's favorite for his child. Physicians endorse it. To see it is to buy it. We make a special offer to parents.

Hygienic Fads of a Day

By Edward A. Ayers, M.D.

The world is full of pent hygienic ambitions, latent explosive forces seeking cures, and, as corn in the popper, they must explode to relieve tension. Yesterday it was sun baths modified by blue glass, marine strolls on the dew, or in the "allogotheric" chloride of gold, vegetarianism, nut diet, Jagerstein, electric belts, high oscillations, hunting, etc., and Jagerstein. Today it is negation therapeutics, evanescent psychotherapeutics, Melekoff lactone; and to-morrow it will be something else equally exciting and ephemeral. What a scrap-bag of sanitary fads is accumulating! Shades of colonel, fresh air, exercise, and simple diet! The constant succession of fad cures, which go up like a rocket and come down like the stick ought to develop a large lump of pessimism—but does not.

A "cure," as the average mind conceives it, is of scarcely equal importance to angel visits or arrival of one's proverbial "ship," to hon's teeth or to incantation weather prediction. If the medical profession can qualify as an expert it will count demonstrated "cures" on fingers and thumbs, and still not find all required. There are thousands of remedies wholly satisfactory, and hundreds of complaints directly curable, but not a dozen specific cures of constitutional diseases.

A remedy which can cure a constitutional disease is called a "specific," because it can single out and destroy the special cause of a disease. Such are quinine in malaria, Behring's anti-toxin in diphtheria, mercury in syphilis, and a number of other germ destroyers. But as infectious diseases have yet been cut short by direct saturation of the blood with germicides, the strength of saturation necessary being also destructive to man.

Another great field in which we may look for "specific" cures is that of the chemical diseases, which are due to loss of proper proportion of the natural secretions which sustain health—gastric, pancreatic, thyroid, adrenal, and to over-accumulation of chemicals which should be eliminated. Such diseases are gout, rheumatism, cruetism, Addison's disease, various heart and kidney disorders, hardening of the arteries, and consequent apoplexies, convulsions—even epilepsy.

Most of the exploited cures that hold the public eye for time have elements of truth, and while applied with the caution and fidelity innate with new fads, prove helpful, but only for a while. Did the Kewley cure ever cure? No doubt many men did stop drinking liquor who took the cure; but the chloride of gold had nothing to do with it. No chloride of gold, nor any other remedy, can reverse the destructive change in structure found in cirrhosis of the liver due to prolonged alcoholic saturation, any more than a harness maker can "doctor" a rotted trunk back to sound leather. The blue-glass crane had a scientific basis of fact which was elucidated through the Finson light rays.

The influence of mental attitude over physical and mental hygiene is very great, but its degree is widely exaggerated when set up as a cure-all, or even a remedy that is independent of many purely physical aids. At what insanity one must have arrived who treats melanocholia, headache, with loss of appetite and ferret tongue, all due to too much food and too little elimination, by lectures and prayers, when a good dose of castor oil will give dumb, struggling Nature the simple assistance she would gladly give, could she but speak? Or what shall we say of analgesic acetaminol headache cures in similar conditions, which only another Nature's cry for genuine relief? The world's remedy stage is recorded with a mob, each member watching hawked for a passing monopoly of the blue-print centre. With will we realize that our bodily mechanism is the most complex unit on earth, and that the application of remedies is and must be a great art founded in wise adjustment of widely varying, yet intimately interdependent, scientific facts?

Medical science is the most exciting of all, yet what a host of "half-baked" enthusiasts, or promoters, rush forward, ready to juggle with the mechanism of life!

There's twice the pleasure in the journey, and twice the pleasure afterward—if you

A SPIRIT IN PRISON

(Continued from page 26.)

water, to persuade you. Why didn't you hear me? Papa has a splendid voice, almost like Tanigamo's in the gramophone, when he sings the 'Addio' from *Otello*. Of course we kept a little out of ear. Papa is so easily recognized by his red mustaches. But still you might have heard us.

"I did."

"Then why didn't you come on to the balcony, amico mio?"

"Because I thought you were street singers."

"Davvero? Papa would be angry. And he is in a bad temper to-day anyhow."

"Why?"

"Well, I believe Gilda Mai is going to bring a *reunion* against Viviano. Of course he won't marry her, and she never expected he could. Why, she used to be a milliner in the Toledo. I remember it perfectly, and now Nigimondo— But it's really Gilda that has made papa angry. You see, he has paid twice for me, over four thousand lire, and the other time three thousand five hundred. And then he has lost a lot of money lately. He has no ink. And then he, too, was in a row yesterday evening."

"The Marchese?"

"Yes, in the chain. He slapped Signora Morani's face twice before every one."

"Diletti! What a lady!"

"Well, if you like to call her so," returned Doro, negligently. "Her husband is an impigante of the post-office, or something of the kind."

"But why should the Marchese slap her face in the chain?"

"Because she provoked him. They took a flat in the house my father owns in the Strada Catinone. After a time they got behind with the rent. He let them stay on for six months without paying, and then he turned them out. What should he do? Doro began to gesticulate. He held his right hand up on a level with his face, with the fingers all drawn together and pressed against the thumb, and moved it violently backwards and forwards, bringing it close to the bridge of his nose, then throwing it out towards Arleto. "What else, say? Was he to give his beautiful rooms to them for nothing? And she with a face like—have you, I ask you, Emilio, have you seen her teeth?"

"I have never seen the signora in my life!"

"You have never seen her teeth? Dio Mio!" He opened his two hands, and, lifting his arms, shook them loosely above his head, shutting his eyes for an instant as if to ward off some dreadful vision. "They are like the keys of a piano from Bartorelli's! Bartorelli!" He dropped his hands and opened his eyes. "Yesterday papa was walking in the Chain. He met Signora Morani, and she began to abuse him. She had a red parson. She shook it at him! She called him 'rigliando'—papa, a *Pancetti*, del *buco di Vetrasso*! The parson—it was a bright red, it irritated papa. He told the signora to stop. She knows his temper. Every one in Naples knows our tempers, every one! I, Viviano, even Nigimondo, we are all the same, we are all exactly like papa. If we are insulted we cannot control ourselves. You know it, Emilio!"

"I am perfectly certain of it," said Arleto. "I am positive that none of you ran."

"It does not matter whether it is a man or a woman. We must do something with our hands. We have got to. Papa told the signora he should strike her at once unless she put down the red parson and was silent. What did she do, the imbecile? She stuck out her face like this,"—he thrust his face forward with the right cheek turned towards Arleto—"and said, 'Strike me! strike me!' Papa obeyed her. Poem, poem! He gave her a smack on each cheek before every one. 'You want education!' he said to her. 'And I shall give it to you.' And now she may bring a *processo*, too. But did you really think we were street singers?" He threw himself back, took the cigarette from his mouth, and laughed. Then he caught hold of his blond mustache with both hands, gave it an upward twist, at the same time putting his big lips, and added:

"We shall bring a *processo* against you for that!"

"No, Doro, you and I must never quarrel. By the way, though, I want to see you again. Every one talks of the *Pancetti* temper, but when I am with you I always see you smiling or laughing. As to the Marchese, he is as lively as a boy. Viviano—"

"Oh, Viviano is a buffoon. Have you ever seen him imitate a monkey from whom another monkey has snatched a nut?"

"No."

"It is like this—"

With extraordinary subtleness he distorted his whole face into the likeness of an angry ape, hunching his shoulders and uttering three simian cries.

"No, I can't do it."

With equal subtleness and self-possession he became his smiling self again.

"Viviano has studied in the monkey-house. And the monk looking the other way when he passes along the Marina where the women are bathing in the summer? He shall do that for you on Sunday afternoon when you come to *l'appuntamento*. It makes even mamma die of laughing, and you know how religious she is. But then, of course, men—that does not matter. Religion is for women, and they understand that quite well."

The Marchese never made any pretence of piety. One virtue he had in the fullest abundance. He was perfectly sincere with those whom he considered his friends. That he might be any need for hypocrisy never occurred to him.

"Mamma would hate it if we were saints," he continued.

"I am sure the Marchese can be under no apprehension on that score," said Arleto.

"No, I don't think so," returned the Marchese, quite seriously.

He had a sense of humor, but it did not always serve him. Occasionally it was stifled and, when assuaged by irony, remained at a distance.

"It is true, Emilio, you have never seen me angry," he continued, reverting to the remark of Arleto; "you ought to. Till you have seen a *Pancetti* angry you do not really know him. With you, of course, I could never be angry—never, never. You are my friend, my comrade. To you I tell everything."

A sudden remembrance seemed to come to him. Evidently a new thought had started into his active mind, for his face suddenly changed, and became serious, even sentimental.

"What is it?" asked Arleto.

"Today, just now in the sea, I have seen a girl—Maddonna! Emilio, she had a little nose that was perfect—perfect. How she was sympathetic! What a beautiful girl!"

His whole face assumed a melting expression, and he pressed his lips in the form of a kiss.

"She was in the sea too?" asked Arleto.

"No. If she had been! But I was with papa. It was just after we had been scolding you. She had heard us. I am sure, for she was laughing. I dived under the boat in which she was. I did all my tricks for her. I did the mermaid and the seal. She was delighted. She never took her eyes from me. As to papa—she never glanced at him. Poor papa! He was angry. She had her mother with her, I think—a signora, tall, fat, ugly, but she was sympathetic, too. She had nine eyes, and when she did the seal she could not help laughing, though I think she was rather sad."

"What sort of boat were they in?" Arleto asked, with sudden interest.

"A white boat with a green line."

"And they were coming from the direction of Posillipo?"

"Yes, all! Emilio, do you know them? Do you know the perfect little nose?"

The Marchese laid one hand eagerly on the arm of his friend.

"I believe you do! I am sure of it! The mother—she is fat as a carabinieri and quite old, but with nine eyes, sympathetic, intelligent. And the girl is a little brown—from the sun—with eyes full of fun and fire, dark eyes. She may be Italian, and yet—there is something English, too. But she is not blond, she is not cold. And when she laughs! Her teeth are not like the keys of a piano from Bartorelli's. And she is full of passion, of flame, of sentiment, as I am. And she is young, perhaps sixteen. Do you know her? Present me, Emilio! I have presented you to all my friends."

"Mio caro, you have made me your debtor for life."

"It isn't true!"

"Indeed it is true. But I do not know who these ladies are. They may be Italian. They may be Sicilian. Perhaps to meet you they will have left Naples. Or they may come from Sorrento, Capri. How can I tell who they are?"

The Marchese suddenly changed. His ardor vanished. His gesticulating hands fell to his sides. His expressive face grew melancholy.

"Of course. How can you tell? Directly I was out of the sea and dressed, I went to Santa Lucia. I examined every boat, but the white boat with the green line was not there, *bastia!*"

He lit a fresh cigarette and was silent for a moment. Then he said:

"Emilio, rarely will you come out with me to-night?"

"With pleasure."

"In the boat. There will be a moon. We will dine at the Antico Giuseppe."

"So far off as that?" Arleto said, rather abruptly.

"Why not? To-day I hate the town. I want tranquility. At the Antico Giuseppe there will be scarcely any one. It is early in the season. And afterwards we will fish for *caridee*, or *caracelle*. Take me away from Naples, Emilio; take me away! For to-night, if I stay—well, I feel that I shall not be happy."

Arleto hushed into his big roaring laugh.

"And why do you want to be saints to-night?" he asked.

"The beautiful girl! I wish to keep her memory, if only for one night."

"Very well, then. We will fish, and you shall be a saint."

"Caro Emilio! Perhaps Viviano will come too. But I think he will be with Lidia. She is staying to-night at the Teatro Nuovo. Be ready at half past seven. I will call for you. And now I shall leave you."

He got up, went over to a mirror, carefully arranged his tie, and put on his straw hat at the curiously most impudent angle.

"I shall leave you to write your book while I meet papa at the villa. Do you know why papa is so careful to be always at the villa at four o'clock just now?"

"No?"

"Nor does mamma? If she did! Povera mamma! But she can always go to mass. A clerical, Emilio."

He moved his hat a little more to one side and went out, swinging his walking-stick gently to and fro in a manner that was positive and almost sentimental.

(To be Continued.)

Trees as Crops

"It is as sure that forest land can be made to grow successive crops of trees under proper methods as that plough land can be made to grow successive crops of wheat," says the Secretary of Agriculture, in the part of his annual report wherein he speaks of the national forests.

This country, which once could boast of forest resources richer than any other nation in the world, has been cutting three times as much timber for a number of years as there is grown, and the consideration of timber as a crop to be carefully harvested has come at a time when many of the virgin forests are already depleted. Continuing, Secretary Wilson says in part:

"Just as American farming has had to develop, and is still developing, methods adapted to the conditions of each region to make the best use of the agricultural lands, so must the forester learn by scientific study and practical trial to make the best use of our timber land. And the best use means, of course, not merely its best use for the growing of trees, but its best use with reference to all interests directly or indirectly affected by it.

"As time passes, it will doubtless appear that the principles which centuries of experience in other countries have placed at our command can be applied with increasing good results as we grow more familiar with our own special conditions. The issue is sharply between caring for our forests by applying a system of known efficiency or suffering certain loss, not only of the forests, but of water and soil as well, through the operation of causes as certain to set as are the rivers in run to the sea."

The Forest Service now has administration over more than 164,000,000 acres of land. This is slightly more than one-fifth of the country's total forested area; the remainder is in the hands of private owners. Nearly all the timber land of the unappropriated public domain is now in the national forests. This means that it is being protected against fire, theft, and wasteful exploitation, that its power to grow wood and store water is being safeguarded for all time, and that, nevertheless, its present supply of useful material is open to immediate use whenever it is wanted. The report says:

"The timber in the national forests, which is the legacy of the growth of centuries, is now in the trust of the public property, administered for the benefit of the people—primarily for the benefit of the people of the West, since they are nearest at hand, but on the whole, for the benefit of every part of the country, since the welfare of every section is interwoven with that of all others. The communities and settlers adjacent to the forests are safe from any fear of monopoly of one of the chief necessities of civilized man."

The secretary tells interestingly of how the government manages its timber lands as a trustee. It gives timber away through free-use permits in small quantities to the actual home-maker, who comes to develop the country, and in larger quantities to communities for public purposes. Its system of management is vastly different from that of a landlord. Where large quantities of timber are harvested from the national forests sales are made to the highest bidder, but under such restrictions as look to the maintenance of a lasting supply answering to the needs of the locality, to be had without favoritism and without extortionate demand based upon the necessity of the consumer.

The Tax Dodger Doesn't Tell

"What is 'untold wealth,' pa'?"

"The property you keep out of the tax list."

Spring Cleaning

Mrs. JAMES. "Good gracious, Mrs. Brown, why is your husband going through all these 'strange actions'? Is he training for a prize-fight?"

Mrs. BROWN. "Not at all; he's merely getting in form to beat the carpets."

The Social Work of the French Railroads

HE railroads of France cover 34,778 kilometers, and employ 253,000 men, each of whom is comfortable, comfortable, and comfortable. He needs have no anxiety for the future of his family, for he knows that he will receive his pension when he becomes too old to work. He saves from twelve to twenty per cent. per diem on living expenses. All the men who work on the roads are lodged free of charge in houses

built by the companies, and as a rule their fuel and lights are supplied free. In exceptional cases payment is made at the price for which the companies obtain their own lighting and fuel. When the employee does not need a house he is allowed the rent equivalent, the money being devoted to his credit with his retirement fund. The building and loan associations maintained by the companies build houses for the employees and lend money at three per cent.

By forming societies which work under their own auspices, or by contributing to the employees' independent associations, all the companies have made it easy for their workmen to buy provisions, furniture, clothing, and household goods of every kind. The railroads have established general stores, which are open to all who work on the roads and sell goods at cost prices. They also maintain and assist the free stores which the employees have founded, but these are not sufficiently numerous to do the work of the companies' own stores.

When a man changes his run, or when the company moves him to a new station, if the cost of living in the new place exceeds the cost of living in the old, allowance covering the excess is added to his pay. The company helps him pay for his uniform. In 1903 the railroads' bill for uniforms for their employees amounted to \$125,000. When a man has two or more children, and his pay is below a certain amount, the company supplements his salary in order to enable him to bring up his child in a manner adequate to his dignity as a representative of the road. If he has needy relations dependent upon him the company allows him money enough to do his duty, as he sees fit. Just as French justice admits the heat of passion as an "extenuating circumstance" in crime, so the French railroad corporation recognizes the necessity of a man who may live on a stipend sometimes burdening himself with dependent relations. When the workman is sure that his circumstances are beyond his resources he turns to the boss as a boy turns to his father, and his right to assistance is never questioned. The company lends him just what he needs, without interest. Sickness, death, a request for help from a poor relative—anything of that kind is considered valid reason for his demand for a loan, and he gets his money without a string to it.

A notable source of profit is the prize-money for vigilance and good work given by the companies. In 1906 this item amounted to \$1,028,200.

The men work for the comfort and convenience of the company; they represent the roads; they are the only men of the roads seen by the public. The American railroad employee may be the only visible representative of the road, but he does not glory in his position; he is hard worked; generally he has no pension to look forward to; he knows that his widow will work after he dies—presumably for the company, but still she will work and work hard. Not so with the widow of the French railroad employee. She lives on the pension. The companies maintain a fund for the orphans of their employees. The apprentice schools in the companies' workshops, professional schools, and similar institutions, which include house-keeping schools, are considered necessary to the normal well-being of the employees and their families. In 1906 \$171,200 beyond the regular subscriptions were devoted to the employees' musical societies, clubs, and analogous associations.

Employees and their families travel on their own lines on passes, and the passes cover all the dependents. Indigent off-shoots of the family and the children who may be under care of the family. On all lines except his own, the railroad employee and his family pay one-quarter fare. Once a year every employee has a right to travel free on all the lines; the company takes it for granted that it will do him good to see the total railroad system of France. The women of the family go in and from the market on trip tickets, the children travel free of cost to school and back.

Although strict precautions are taken to prevent diseases, accidents, and alcoholism, the companies' expenses are heavy. But no man employed by a French railroad corporation worries for his future or for the future of his family. Doctors, nurses, and aid are furnished. So, well dressed, well fed, well housed, with money plied up against the idleness of his latter years, assured of the well-being of his family, the French employee dances gaily through his twenty-five years of active service; or, if incapacitated, ends his days a pampered invalid. During sickness his pay goes on. Some roads allow their employees full pay for six months of sickness, with the right (well supported by a doctor's certificate) to increase the time to an additional six months' full pay, followed by six months' half pay. The families of the employee also receive free medical attendance.

Usually the working life of the railroad man amounts to twenty-five years, but the systems of the companies provide for premature incapacity. The railroad employee's widow receives half his pension's present, and orphans are given a proportional fraction of this amount.

Antwerp's Diamond Cutters

T is estimated that nearly one-half of the 3000 diamond cutters of Antwerp were thrown out of work through the failure of orders from the United States on account of the financial crisis. Almost three-fourths of the world's production of diamonds are bought by the people of the United States. There were practically no diamonds sold to the United States in the Antwerp market during November and December, owing to the financial crisis. What an instantaneous effect financial slumps have on the selling of luxuries may be seen from the falling off in the demand for diamonds on American account, as shown in recent statistics from New York, according to which the cut diamonds imported amounted in November to a value of only \$353,000, as compared with \$781,000 in October, \$1,311,000 in September, \$2,369,000 in August, and \$2,674,000 in July, the annual products showing a similarly heavy shrinkage.

The diamond trade of Antwerp is one of the most important and valuable of Belgium. It is certainly the most exclusive trade in the world, and attempts are made on the part of cutters, cutters, and polishers not to allow any outsider to become acquainted; and, in fact, the dealers on the part of the diamond manufacturers to introduce apprentices, owing to a lack of skilled labor, brought about a very serious strike two years ago. To settle it the employers agreed to reduce the number of apprentices to 300 and made other concessions.

Apprentices are required to take a course of one year's instruction before being entrusted with regular diamond cutting. This begins by learning the formation of a diamond, the number of facets to be cut, and

the handling of the machinery. For the latter work they are given crystals to cut. When the year's instruction is over they begin to earn a wage of from \$5 to \$8 per week. Diamond cutters are paid a wage of \$12 to \$16 per week, cleavers \$20 per week upward, while the sorters receive \$6 to \$10 per week; thus the average wages amount to \$13 to \$14 per week.

Thirty-five years ago the diamond trade was in such flourishing condition that a good cutter earned as much as from \$220 to \$250 per week. This remarkable state of things, however, attracted the attention of workers from all over the country; keen competition ensued, with the consequent diminishing of wages.

The secrecy of the art of cutting and polishing diamonds is maintained so completely that it is difficult to introduce this industry anywhere, save through Belgian or Dutch emigrating cutters. Thus some of the Antwerp manufacturers have emigrated to the United States, where they now supply a good part of the demand for diamonds in that country from which they have been expelled there. A similar attempt has been made in London.

The diamond cutting industry is divided into three distinct heads—cleaving, rough cutting (or bruting), and polishing. The first process is that of cutting a large, rough stone from the mine into smaller ones; but this is avoided as much as possible, unless the manufacturer knows that the smaller stones will realize a higher price than would the one large size. The process of cleaving is not practiced to any extent, a majority of the stones being at once submitted to bruting.

In cleaving or sawing the rough stone is placed in a metal receptacle with the side to be cleft downward, when a mould is placed

over it into the top of which liquid aluminium is poured. This takes the shape of the mould and, after cooling, firmly grasps the stone in its position, the mould being then removed. The cutting tool is a circular saw, about four and a half inches in diameter, made of soft copper, the edge of which is prepared with diamond dust and oil. The rough stone is then set with a slight pressure against the side of the saw, and remains in that position frequently as long as two weeks, according to the degree of resistance of the crystal.

Some manufacturers cut the products of cleaving into layers as thin as a layer sheet of paper, and from these layers is cut what is known to the trade as the Antwerp rose, a specialty of this market.

Rough cutting, or bruting, is a process which might be termed that of "diamond cut diamond." Two stones of similar size and degree of hardness are fitted into metal cups with cement. One of these cups is fitted to a rotary machine, of which the stone forms the centre. The other cup is fitted to a long handle, and the cutter places this against the revolving stone, which is the first one to become smooth. Then the diamond held by the cutter is in turn put in the rotary machine, etc.

For final cutting and polishing the point of the bruting is either set in position at the exact angle, in a copper holder, into which it is firmly fixed by means of a clamp, or held in position by a mould of lead, which has been heated for the purpose. When the stone is properly held by the clamp or mould it is pressed by the weight of the same against a revolving disk of soft red rotating horizontally at the rate of 2000 revolutions per minute. The disk is covered with a film of diamond dust and olive oil. After this the diamond becomes marketable

Skyscrapers

SKYSCRAPERS still aspire. They rank to-day among essentials, while their future teems with possibilities. Erected here and there, isolation made them all the more conspicuous, and at first suggested doubts of their stability. Now, however, they have become commonplace, and their capacities await development.

In London, where the problem of the sixteen millions to be sheltered in 1961 is causing some uneasiness, skyscrapers have at length been recognized among means toward that end. America, upon the other hand, processes buildings ready to exploit, not for instance, by the introduction into New York city of an elevated road above the present one. Presuming lanes still to grow, indeed who knows but that an airship system will ultimately obtain with transportation further skyward.

One outcome of "the higher life" may be the cultivation generally of the roof garden. Bridges between blocks will unify the upper world, which will present the appearance of a horticultural cloistered or of an elevated Central Park in flower.

Skyscrapers constitute in brief man's final protest against burrowing instincts. Babel was his first idea, but wiser now he is content with humbler yet more practical results. True, he mines and "moles," but either to enrich himself or for convenience sake, not as certain animals to make a subterranean home. Basement dwelling, for example, may be taken as significant of his last lingering tendency toward old cave habits.

As to Wisdom

THE Owl the bird of wisdom is,
The Sphinx some folks consider wise.
The first has no known varieties,
The second sounds no foolish cries.

The first we judge by sunny winds,
Portentous, full of gravity;
And what the second really thinks
Is doubtless thought sagaciously.

Yet wisdom goeth not by rules—
That's clear, for it is all too true
I've had more sage advice from fools
Than ever I got from Coler too!

BLAKESLEY GRAY.

BENJAM. "I wonder what he will do with it?"

The Plumber's Trade

Good plumbers are now said to go to Chile when they die. The national government has just directed that a large number of the cities put in complete water and sewerage systems. This means a greatly increased demand for all plumber's supplies. Hereafter the demand for this class of goods has been limited to Valparaiso and Santiago, while from now on it will be much more general, and the demand should soon be doubled.

So far the United States has been supplying only a comparatively small part of this business, and while American-made goods are well received, the trade has not been properly exploited. The United States supplied in 1906 only about 3 per cent. of the lead pipe imported, which in all amounted to \$24,577, 1/2, currency; while of the bath supplies we furnished about 51 per cent. of the \$21,390 worth. The other accessories of the plumbing business largely came from Europe, England taking the lead in such articles as brass tubing, valves, faucets, etc.

SHAM. "Yes; poor dear father went to board."

George Washington

UNTIL every generation of Americans George Washington is justly held to be the purest figure in history—a superb example of the perfect citizen—a just and righteous ruler and "a light for after time."

This commanding personality had a magnificent physique. He stood over six feet in his stockings, was remarkable for brawnymanhood, agility and strength—the finest gentleman and athlete of his day.

His constitution was of iron and he knew how to keep it so. His biographers declare that in eating and in drinking as in all things he was normal, enjoying the juice of the malt all the days of his life. He drank it around campfires, as well as in his own home and upon social and state occasions.

Furthermore, upon his Mount Vernon plantation he had a brew house, as was the regular custom of wealthy Virginians.

"In Virginia the richest colonists brewed beer from malt imported from England."—NAT'L MAG. HIST., vol. 16, page 150.
Ford's Biography (1906), page 153. Quotation from Samuel Stanwix (1814).
History of Virginia by Beverley, Colonial Lessor Laws (Thomas), p. 66.

Budweiser

IT shines like liquid gold—it sparkles like amber dew—it quickens with life—a right lusty beer—brewed conscientiously for over fifty years from barley and hops only.

It prolongs youth and preserves physical charm—giving strength to muscle, mind and bone—a right royal beverage for the home.

"Better than
THE SPOILERS"

THE BARRIER

FIRST of all, this new novel by Rex Beach is a big, buoyant, bracing story of the last frontier—Alaska—a story to equal "The Spoilers" in every way. This is one half of **THE BARRIER**. The other half is its triumphant love drama. In this the new book surpasses "The Spoilers."

By
REX BEACH
Author of
THE SPOILERS

In **THE BARRIER** there is a new setting, too, but still in the virile air of the North. The new people whom Mr. Beach makes live before you in the clean-cut pages of **THE BARRIER** are intensely human. More than one of them will become celebrities in fiction.

THE STORY? In the opening chapter of **THE BARRIER** the reader scents a mystery and is on the eve of a love affair. Old man Gale, a trader at Flambeau on the Yukon, the father of three children mothered by an Indian squaw, brings the story on with a rush. His daughter, Necia, a beautiful girl of eighteen, is **THE BARRIER'S** heroine. Necia falls in love with and is loved by Lieutenant Burrell, a young Kentuckian, arrived with a handful of men at the post to act as mounted police. From this critical moment there is not a dull page to the end. Some quaintly humorous characters are introduced also. In fact, the humor of **THE BARRIER** is another feature in which it surpasses "The Spoilers."

STORIES OF SYMPHONIC MUSIC

A Guide to Modern Orchestral Programme-Music

By LAWRENCE GILMAN

Music Critic of "Harper's Weekly"

This book fills a genuine need of the music-lover, for it offers in compact, accessible, and easily intelligible form information which will help him to listen understandingly to the music of an orchestral concert. It presents clearly and without technical analysis the poetic or pictorial or dramatic basis of every important example of programme-music in the symphonic repertoire, putting the reader in possession of information which will enable him to listen comprehendingly, for example, to a symphony by Berlioz, an overture by Mendelssohn, a symphonic poem by Liszt, or a tone-poem by Strauss or Debussy.

"The best thing for every concert-goer to do is to get a copy of Mr. Gilman's book and prepare himself beforehand."—*N. Y. Evening Post*

"From Berlioz and Liszt and Raff and Wagner, down to the latest works of Stravinsky, Debussy, Nielsen, Rimsky-Korsakoff, Elgar, Chabrier, and Converse, with many others that will occur to concert-goers, Mr. Gilman has left nothing that has any claim to the attention of music-lovers. . . . It is a useful and interesting book."—*The New Music Review*

"A valuable contribution to the music-lover's library."

Price, \$1.25 net.

COMMENT

Whyum, Whyum!

MR. BRYAN prints the following in big type at the head of his *Commoner*:

"THE BEST AND ONLY POLICY"

GEORGE HARVEY, editor of HARPER'S WEEKLY, replied to be asked by JOHN HUNTER MORGAN, made an interesting answer to the New York World's query, "What is the best principle and what the best policy to give the Democratic party new life?" Here is Mr. HARVEY's answer:

To the Editor of the *World*: The best principle: The Constitution. The next best: Tariff for revenue only. The best and only policy: Beat BRYAN.

GEORGE HARVEY.
 New York, March 10.

Now, WHYUM! Honest, Injun, cross your heart, do you really believe that any living human being other than the editor has or pretends to have a word to say respecting the policy of this journal? Moreover, between ourselves, aren't your arguments in favor of your own candidacy getting down to cupbuns when you have to base them upon the presumed opposition of a standfast Republican, who probably never voted a Democratic ticket in his life, and who, if we may be so bold as to say so, recently rendered greater service to his country in two weeks, than you have in your whole forty-eight years?

Still Calling for Instructed Delegates

On February 21 Mr. BRYAN addressed his faithful adherents at Springfield, Illinois. There was a good turnout, a thousand delegates from seventy-nine BRYAN clubs. It was BRYAN day in Springfield, and the *Commoner* calls it "a glorious Democratic day." Brother BRYAN, speaking as it were in his own political family circle, poured out of his heart the thoughts that were warmest in it. He told how he had abstained from coming forward as a candidate until he just had to, and then he unbuttoned his heart. He said:

If I am nominated I want the nomination to come from the voters rather than from the convention. The convention is but the servant of the voters—the voters are the masters. They have a right to determine both the platform and the candidates. If you want me nominated, instruct for me. Instructions are democratic. No one has any right to represent others unless they want him to represent them.

I believe in instruction. I do not care upon whom your choice falls. Wherever he is he would have delegates instructed by the people who elected them. They should represent the wishes of the people.

If I am to be your candidate I want your delegates instructed for me. If I am your candidate again it will be in answer to a call from the party, and upon that condition only am I a candidate. If the voters of the party want me for their candidate they will instruct their delegates to that effect.

And there is more needed than instructions. The delegates should be men who are willing to be instructed. They should be men willing to carry out the instructions which the people give them.

Is not the Old Doctor getting a bit nervous about his prospects? What is all this chatter about instructions but a token of the eagerness of assurance to make itself doubly sure betimes. The every man up to me that you can, says BRYAN. Tie him up tight and early. There's no telling what a lot of delegates may do when they get together and begin to talk things over. Tie them hard and fast beforehand and hand them over to me. I am the only possible choice by previous instruction, therefore instruct. "There is no doubt that a large majority of the people believe in Democratic principles and are ready to try the policies that our party has been advocating." Therefore instruct for me! Send only instructable men, and instruct them beforehand.

"Smash the Corporations"

The night before he spoke (as above) at Springfield, Mr. BRYAN spoke at a mass meeting in Chicago. It was his forty-eighth birthday, but it was not so much of a family party as he made the next day at Springfield. "Why Democracy?" was his subject, and the gist of his address seemed to lie in this inquiry:

Shall the government be administered in the interests of the whole people, by unpartisan and incorruptible representatives of the people, or shall the favor-seeking corporations control the elections, raise their representatives to power, and through them exploit the country? If the present situation is satisfactory; if the people are contented with the distribution of wealth and with the predominant influence of these combinations, then there is no good reason why the Republican party should not be continued in power, for it has created the conditions which now exist and must have credit or blame, according to whether these conditions are desirable or undesirable.

So far as there is meaning back of this language, Mr. BRYAN's answer to his question of "Why Democracy?" is, "To pound the corporations still harder than they have yet been pounded, and wipe them out if possible." That cry will carry no elections this year. The disposition already is more to save the pieces than to smash, and it is likely to be stronger in the fall than it is now. "Smash the corporations" won't do, Mr. BRYAN. If there is anything in it, Republican La FOLLETTE is a likelier man to profit by it than you are.

Hope for the Jobless

SENATOR L. A. FOLLETTE has declared in the Senate that Mr. MORGAN and Mr. ROOSEVELT and a few of their friends devised and brought on the panic, timing its culmination to their personal convenience and profit. Can he not induce these powerful gentlemen to bring on a return of business prosperity, or at least learn the terms on which they will undertake the work? If they could blight business, probably they can also restore it.

Political Hysteria and the Prospect of Rest

If the judicially minded among us need any evidence to establish the truth of Mr. CLEVELAND's epistolary observation in the *Hartford Times*, that we are as a people at present politically hysterical, a perusal of this month's newspapers should be sufficient. Neither the preparations in San Francisco to put ex-Mayor SCHWARTZ back on the gridiron, nor the promising prosecutions in Illinois of JOHN R. WALSH and in Pennsylvania of the Capital grafters, nor the investigations by the House of Representatives into the conduct of the Electric Boat Company and Duke LAMARUS F. WALKLEY, nor the naval investigation by the Senate, nor the true bills found against Messrs. HAYNE and MOORE, nor the charges of having spoken evil of our Chief Magistrate lodged against Chancellor DAY, nor the proposal that our State Legislature investigate the Attorney-General, nor the proposal that the same body delve into the secrets of this city's administration, reads as conclusive evidence of hysterical hyperactivity. But when we read of the District Attorney and the Police Commissioner and the Mayor being charged with

neglect of duty, and labor demanding exorbitant concessions from the Speaker and the Vice-President on pain of political injury and in terms, to say the least, uncomplimentary to the Supreme Court, the only explanation is that as a people we have become undrugged. Probably from seeing Prosecution so often issue precipitously and noisily from his high place we have unconsciously begun to do likewise. Sometimes in the manner of labor, when it reflected upon the wisdom of the judiciary, we have been imitative in our choice of victims; but even more distressing is the fact that of late we have been at times quite original, as, for example, when Dr. PARKHURST preferred his charges against the Police Commissioner and the Mayor. Like the Sparti, a CARMER having thrown stones among us, we have begun to be unreasonably suspicious and quarrelsome. But we cannot continue this way forever; indeed, there are indications even now that we are beginning to appreciate the need that Mr. CLAYLAND speaks of—our need of rest.

Bryan by Acclimation

We learn from a reproachful correspondent, who writes from Tallon, Nevada, that "Mr. WILLIAM J. BRYAN will be nominated, very likely by acclamation, at Denver." We hope he will be nominated that way, if at all, but if the delegates stay till they get acclimated, they will have time to deliberate, and if they once begin to deliberate, Brother BILL will be dropped over the side. Denver is an altitudinal place; the atmosphere is rarefied, and tends to increase heart action, make the head light, and intensify the efficiency of stimulants. Brother BILL's best lay will be to swoop down on the delegates while they are still bewildered by the atmosphere and their ears are still ringing. That is the time when he can best stampeede them by a transcendent feat of oratory. My! what fun he will have with them! But if he waits till acclimation has brought them back to normal, his burst may not take effect.

The Intricacies of the Law in California

A few months ago the people of the State of California having proceeded to conviction the then Mayor of San Francisco, EDMUND R. SCHMITZ, that gentleman was sentenced and incarcerated to the accompaniment of much talk about the violation of the city. But, if we remember rightly, the only thing certain about litigation is its uncertainty, a truism of which the San-Franciscans must be aware now that SCHMITZ is to be seen again at liberty about the streets. For SCHMITZ, if the judgment against him had not been reversed on appeal and the reversal affirmed by the Supreme Court of California, would still be wearing stripes. The trouble was with the indictment; it was, in the opinion of the Supreme Court, "insufficient." It charged the defendant with extortion, but it omitted the allegation of certain facts essential to an establishment of the same as defined by the penal code of the State. According to the code, the demand for money must be accompanied by a threat to do unlawful injury. But the indictment merely averred that SCHMITZ had threatened to prevent the French restaurant keepers from obtaining liquor licenses if they did not pay him money. Now, as it was lawful for the city police commissioners to withhold such licenses and lawful for the Mayor to legitimately persuade them to do so, SCHMITZ's threat as presented in the indictment could not be assumed to be a threat to do an unlawful injury, and therefore the indictment did not make out a case of extortion. On such reasoning, without consideration of the record, the Appellate Court reversed the judgment of the trial court against the defendant, and the Supreme Court affirmed the reversal. Whether they did well to decide as they did without looking at the record is a fine point of law. The custom of thus taking advantage of every technicality in favor of the accused grew up in the days in England when tender-hearted English judges were expected to sentence to death even those convicted of the most trivial offenses; but why it should be observed by the courts of California, where judges are not and never have been required to send thieves to the gallows, is difficult of explanation.

A Loss to the "Upstate" Commission

Mr. CHARLES HALLAM KREFF is the new president of the Knickerbocker Trust Company. An excellent man for

the place, no doubt, with a good reputation as a public servant, and his experience as the Assistant Secretary of the Treasury behind him. There is only one thing to regret about his taking the important place to which he has been called. It takes him away from the "Upstate" Public Service Commission. If the most efficient members of these important commissions are to be called to other posts as soon as they begin to be useful as commissioners, how are the commissions going to acquire the experience that they need to qualify them for their work?

The Exonerations of Judge Lebbeus R. Wilfley

Owing to the unsatisfactory administration of justice by the United States consular courts in China, Congress, on June 30, 1906, created a United States court for China, which was opened in due course the following December at Shanghai by Judge LEBBEUS R. WILFLEY. Now conditions in Shanghai were unusual; therein America was predominantly represented, greatly to the detriment of her good name, by saloonkeepers, gamblers, and ladies of Mrs. Warren's profession, and it behooved the judge to clean house, which he did—much to the relief of decent American citizens resident. But in the process he awakened by his stern rulings a spirit of resentment in certain of his compatriots of the legal persuasion. Above all, they appear to have objected to his having required them to give satisfactory evidence of their good moral characters and legal qualifications in order to gain admission to the bar of his court. The reason for this objecting is to be found in the result of the examination—of the eight who took the first examination only two passed. On a subsequent trial, Mr. LOUIS ANDREWS, one of the six who failed, succeeded in passing, but his disqualification seems not to have been dispensed, for last month, through Representative WALSH, he submitted to the House charges against Judge WILFLEY, and demanded of that body the judge's impeachment. However, it is pleasant to note that last week the sub-committee of the Committee on the Judiciary, to whom the matter had been referred, exonerated the accused, as had already Secretary ROSS and the President, who, after a generous use of characteristic adjectives, ended his letter of endorsement by writing, "It is not too much to say that this assault on Judge WILFLEY, in the interest of the vicious and criminal classes, is a public scandal."

Memorials

JAMES WHITEHOUSE BRYAN's "old swimmer's hole" has been saved from destruction and will remain as a memorial to the poet.—*Daily Paper.*

Good! And while we are saving let us save the Constitution as a memorial to President ROOSEVELT, who has plunged into it over his head several times.

The "Tatsu Maru" Affair in the Light of History

In 1875, only seven years after the birth of modern Japan, the King of Korea refused to give audience to an ambassador from Tokio, and subsequently a Korean fortress fired on a Japanese man-of-war, but rather than undertake the punitive measures demanded by many of the people, the Mikado's government negotiated a treaty of peace and friendship, in full expectation that this would result, as it actually did, in an intercorne rebellion. Again Korea dined, in 1882, and again Japan was magnanimous; for the murder of her people and the enforced flight of her minister she merely demanded an apology and a small indemnity, most of which she subsequently returned. A third time, in 1884, history records that Korea, with the assistance of China, committed offenses against Japan—offenses more outrageous than any of those previously perpetrated. The Mikado's subjects were slaughtered by the populace of Seoul, and his legation was attacked by Chinese and Korean soldiers. Among the killed was Captain POTYANSKI, the military attaché. Notwithstanding the Tokio government not only refrained from chastising Korea, but also from reacting to the popular clamor for war with China. They considered it sufficient to exact an apology, a small indemnity, and a speedy punishment of the POTYANSKI murderers. In the light of these three historic episodes a peaceful outcome of the controversy between Japan and China over the seizure of the *Tatsu Maru* was to have been expected, and, having come, is but one more

verification of the often repeated diplomatic announcement that Japan is adverse to seeking redress by violence, whether in war with the strong or in chicanery and robbery of the weak after the manner of certain Western Powers.

Was Governor Gould Misquoted?

The *Buffalo Express* quotes Governor GOULD of Massachusetts as saying in a speech at the Saturn Club in Buffalo on February 29:

Look to the yellow journalism of the civil war—back to HARPER'S WEEKLY, for that was the yellow journal, and see the caricature of a tall giant figure, drawn as a moving skeleton—a figure caricatured, after Frederickburg, as the image of death with his hands dripping with the blood of Union soldiers.

The Governor was disclosing that KINGOLEY was not the first President to be criticized. We have looked, as invited, but do not find the caricature he described. There never was such a picture in HARPER'S WEEKLY. From the breaking out of the civil war the WEEKLY supported LINCOLN'S administration, and it supported LINCOLN for President in 1864.

Insolubility of Professions

College professors are stubborn men, prone to stick to the thoughts their mental processes have yielded, and rash in speaking them in the teeth of the opinions of majorities. On March 10 Mr. KREMER, professor of economics at Cornell, in speaking of stock exchanges declared that "exchanges are big insurance companies, in which every member of society is a member and the speculators are the managers." The managers, he said, took great risks, and must be able men, and deserved to be well paid. By getting advance information about crops and politics they are able to minimize sudden fluctuations and so help to insure society against violent changes. The same day Professor MÜNSTERMANN of Harvard was talking about the dangerous illusions of so-called "common sense," and the help that experts in mental science might bring to the solution of cases that come before courts, and of social questions. He found the use of alcohol a case in point; a psychologist would be able to show, he said, how far alcohol was a factor in crime. And then he dared to say—

Life entirely without stimulation—that is, for the large masses of the people, not for the exceptional individuals—and by that I mean the life without physiological stimulus of any kind, leads to a certain mental monotony which, from another point of view, is exceedingly dangerous. The only solution of this problem would lie in strong education for temperance, but not for absolute temperance.

What shall be done to a professor who goes and says that total abstinence may be dangerous for some people, and that the safer course is in the direction of "strong education for temperance, but not for absolute temperance"? To be sure, Professor MÜNSTERMANN is a German, but would even that be held to excuse him if he held a professorship in a State university in one of the States that have gone, or are going, for prohibition? One professor who says that stock exchanges and speculators are of value to society, and another who declares that common sense is liable to dangerous illusions, and that "absolute temperance" is not the very best thing for all persons. Awful!

The Armstrong Insurance Laws

On another page of this issue of HARPER'S WEEKLY is printed an article by Mr. DAVEN P. KINGOLEY, president of the New York Life Insurance Company, who takes this method of placing before the public his views concerning the ARMSTRONG laws, now in force in the State of New York. As may be understood by reading Mr. KINGOLEY'S paper, the management of the New York Life thinks that certain features of the ARMSTRONG laws are too sweeping in their scope; that their tendency is not merely to limit in future the amount of life insurance that may be written each year, but to hamper the development of the principle of life insurance, and perhaps to lessen efforts to increase the stability and financial resources of the great companies. The latter phase, we take it, is largely of academic interest, for the reason that if every one of the greatest insurance companies quit doing business to-morrow the policyholders of to-day would be amply and thoroughly protected. All the evidence goes to show that life insurance as at present conducted is on a sounder, safer, more businesslike basis than ever before.

Yet it is easy to see that the presidents of the largest organizations must not be content with to-day's situation alone, but must look ahead and plan for future years and future contingencies. As the head of one of the greatest insurance concerns in the world Mr. KINGOLEY is entitled to a fair and impartial hearing. There may be question as to the wisdom of starting at the present time an aggressive campaign for certain changes in the ARMSTRONG laws, but at least Mr. KINGOLEY goes about that work in an admirable fashion. In the old days, happily past but not forgotten, "Homes of Mirth" and "yellow-dog funs" were maintained for the purpose of amending insurance laws. In contradistinction to that is the newer and better method that Mr. KINGOLEY illustrates in an official "appeal to the people" over his signature.

Abruzzi Comes a-Courting

The papers disclose from day to day more or less interesting matter about the proceedings of the Duke of the Abruzzi, an Italian gentleman of credit and renown, an explorer, an officer in the Italian navy, and a cousin of the King of Italy. This good duke, it appears, lately came here a-courting. He was in this country last summer on some errand—to fetch his ship to the Jamestown Fair, wasn't it?—and met Miss KATHARINE ELKINS, the daughter of Senator ELKINS of the ELKINS bill. Miss ELKINS, it appears, was polite to the young duke, and showed him hospitality proper to be offered to a visiting sailorman. The duke readily, even greedily, accepted them all, and even then, it appears, was not satisfied. He wanted more, and asked for it; no less more, it seems, than Miss ELKINS herself. So for some time it has been rumored, and the newspapers have further confirmed to us that when the duke went home and it came to be known that he had set his affections with rivets, and not without hope, upon an untitled American lady, there was a good deal of embarrassment in the royal family of Italy, because the young duke is not only a man of personal deserts and of rank, but of ample fortune, and a proper match for a royal princess. If Abruzzi's relatives required a title, it was but natural. We suppose it is not true that a proposition was advanced to confer an Italian ducal title on Senator ELKINS in order that his daughter might not come to Italy entirely unadorned with appellations of rank. At any rate, the Senator is still unadorned. But the duke, as said, has been back a-courting, and has attended quietly to his affairs of the heart, and gone home; and there seem to be due grounds for the expectation that he will be back again presumably, and that he and Miss ELKINS will get married.

On the American Plan

Good Italian gentlemen are good men to marry. They are men of sentiment and constancy, and handsomely civilized. Moreover, the best of the international marriages to which American girls are parties are probably of more importance to the world than we are apt to give them credit for. They help to make Europe and America acquainted, and where there is due acquaintance there is by so much the less danger of misunderstanding. At any rate, we are all bound to like so much as we have read of the Abruzzi methods of courtship. He proceeds, apparently, on the American plan. We have read of no submission of a schedule of debts, no flicker about settlements, no stipulation for new roofs on the ducal castle or new wallpaper on the ducal walls, no discussion as to whether the money shall be paid in gold coin or drafts on Genoa. All we have heard—pretty much—is that the duke fell in love with Miss ELKINS and that Miss ELKINS is pleased with the duke, and that the chances are favorable to their hitting it off. And, things being as reported, we hope they will, whether it be true or apocryphal that Grandfather GANNAVAY DAVIS has said that "if KATHARINE loves him and wants him, the old man is with her, and if it is money that is needed she can count on me for every dollar in the pile."

Don't Mix Metaphors, Please!

Don't give up the ship, I do not HARVEY, editor of HARPER'S WEEKLY, is still holding on to the country by its nasal appendage—*Knoxville Journal and Tribune*.

Be the rubber, Colored, by the rubber!

It is some such thought as this that comes over us in reading Mr. FREDERICK HALL's most recent book, *The Inward Light*, and in reviewing his equally beautiful book, *The Road of a People*. It is all so like the faith and the trials to which we have been and in which we have grown up that we might almost wonder what new thing we have added to our store by the reading, until we remember the student who was interrupted in his study of the "Bhagavad-Gita" by a call from a sweet old lady who practiced religion, but did not think about it. For, fortunately, we are not all doomed to thinking. "Never mind, father," said the gentle little girl, consoling, to the parent who had made a verbal slip in reciting the Psalms to her—"never mind; it is not your sad business to know the Psalms by heart." So there are plenty of people in the world, and they are often the salt of the earth, who are art apart for fine actions, and it is not their sad business to think out the meanings of religions. So the sweet old lady looked reproachfully at the student, and asked, "Why do you read that book when you have the Bible at hand?" And the student, who enjoyed nothing more than finding out why he did what he was doing, being of the modern complex school, half paralyzed by over-attention to his own mental processes, said, after some reflection: "You see, it is because I never knew anything but the clothes and the outer trappings of my own religion until I read about the soul of another, and then I discovered that I was just exactly what lay under the trappings of my own religion, and that the soul of all good endeavor is the same soul everywhere."

And this is perhaps the main conclusion we have left when we lay aside Mr. FREDERICK HALL's two exquisitely poetical volumes. "The Buddha," he says, "approach to the heart, not to the brain," and this is true of all divine teachers. They, at any rate, know that what is man think is as accidental as what we can have; a mere combination of fortitudes or unfortunate circumstances. "Love and clarity and compassion, endless compassion, are the foundations of his teachings." But so were these the foundations of the teachings of our own religion; only when we are tired of practising them we say that his teachings are impracticable and that probably Christ did not mean what he said. Yet when one takes it at its face value he commends the pure, the humble, the meek, the seekers after righteousness (not in the least those who think they know all about it already, and who feel that they have already paid instalments on their pew rent in heaven by a few orthodox conformities here), the merciful, the daring, the persecuted. He also ratiocinated us not to resist evil, not to go to law, not to judge, not to turn away from borrowers, not to walk along the other side of the street with our eyes turned away when a poor man or a sinful man stumbled and fell; never to excuse ourselves by fancying that we were not our brother's keeper; and finally came the warning, the great warning, the warning to which perhaps nine tenths of humanity would do well to listen very attentively: "Not every one that saith unto Me, Lord, Lord, shall enter into the kingdom of heaven; but he that doeth the will of My Father which is in heaven."

"Many will say to Me at that day, Lord, Lord, have we not prophesied in Thy name? and in Thy name have cast out devils? and in Thy name done many wonderful works?"

"And then I will answer unto them, I never knew you."

The chapter in *The Inward Light* it would be particularly well for Christians to read, the one called "David," the gist of which is for each man to build his life on that he has and build upon it as best he can; for none becomes a good Buddhist by being a bad Christian, or a good Human by being a bad Englishman.

Personal and Pertinent

The papers quoted Mr. ROCKEFELLER as saying lately in Augusta, Georgia, "I am getting to be an old man now, but I am proud and glad to say that I have never touched whiskey in my life." So far, so good; but if it is true, as is alleged, that Mr. ROCKEFELLER acquired in middle life the habit of eating slinkers from railroad lunch counters, and that the digestive collapse which troubled him so much from five to ten years since was due to that reckless practice, he has not much to be proud of in the way of dietician discretion. More rum and brandy might have left him a better man, though he is pretty well again now.

An ancient custom ordains, we are told, that each princess of the house of Hohenlohe shall bring a trade. What foresight this shows in the most aristocratic of houses to so prepare the women of the house that they could, if necessary, stand on their own feet, and that they need not in any emergency find themselves on their hands! Perhaps if the rising American aristocracy were to educate its daughters in kind we should find less narrow and unhappy in the feminine hall of humanity. It might even tend toward stemming the tide of divorces and suicides. To have no other occupation than that of expending money is to make a dangerous social factor of one's self. Spending money for the sake of spending money has never made for rest or contentment. The

only fixed rule to lay down is that the more one spends the more one desires to spend. It is, therefore, the part of prudence to have a safe issue, an interesting avocation, and none is healthier discipline than making some of the money one spends. This is a method almost uniformly applied to the sons of a family, and perhaps as distinctions between masculine and feminine methods and pursuits are more and more obliterated we shall begin to follow the example of the house of Hohenlohe, and have our American princesses taught a trade.

Reading the reminiscences by various "eminent hands" of the late Lord KELVIN, one is more than ever bowed to the conclusion that the great Scots professors are a rare apart. We hear of no such teachers anywhere else, great scholars universities everywhere produce, but we have to read of those North Country teachers who were not only giants mentally, but who also brought to their work extraordinary physical activity and the enthusiasm of boys. We all know more or less of Professor BLACKIE, and STEVENSON, in more than one of his essays, has given us some idea of many another Edinburgh professor, as, for instance, the young TAIT, Lord KELVIN's collaborator on the *Natural Philosophy*; of old LANDAU, TAIT's laboratory assistant, with his rustic air, "sturdy and fresh and plain." And who does not recall the fascinating picture of Professor KELLAND, "lively as a boy, kind like a fatherly grandfather, and keeping perfect order in his class by the spell of that very kindness?" As to FLEMING JENKIN, no one can forget the brilliant characterization of him in *Talk and Teasers*. "LOCKHART is bottled effectiveness, the sworn foe of sleep. Three in the morning LOCKHART," says a victim. "His talk is like the driest of all imaginable dry champagne; slight of hand and lightning quickness are the qualities by which he lives." And all of these men were not merely teachers, but inventors, discoverers, leaders in their several departments.

Lord KELVIN was, of course, the most wonderful of them all. His many inventions in the matter of electrical apparatus, his services in laying the Atlantic cable, need not here be commented. The point is that Sir WILLIAM RAMSAY dwells at length upon his kindness and gentleness, and Professor AYRTON, in the *Popular Science Monthly*, lingers regretfully upon the enthusiasm and high spirits of the man. "When he came into his class room," says Professor AYRTON, "he had hardly given a thought to what he was going to talk about—if it were Monday morning, he had just returned from staying the week-end with TAIT at Edinburgh, and he gave us an enthusiastic account of their talk, bubbled over with what they had been doing, was full of suggestions about it, told us how the manuscript of *Natural Philosophy* was progressing. We felt that we also had been discussing these points with TAIT in his Edinburgh study, and listened with rapt attention to THOMSON's narrative." His talk, we are told, "his sagaciousness, his buoyancy, were like the rays of brilliant May sunshine following April showers." His students dreamed to see him make experiments with his own hands. He was too impulsive, too full of exuberant energy to handle the very apparatus he had adjusted. But the students were only too eager to do things for him, feeling as they did that they "were soldiers of a great warrior." And yet the first laboratory in which Lord KELVIN worked when he became professor of physics at Glasgow in 1846, at the age of twenty-two, was established in the wine-cellar of an old professor's house, and later his laboratory "consisted of one room and the adjoining coal cellar, the latter being the birthplace of the archæo-recluse." To-day the high-school had works in airy laboratories equipped with completeness undreamt of in those days. But those were the days of giants.

Correspondence

RED CROSS BEGINNINGS IN AMERICA

By JAMES MOTT, March 4, 1901.

To the Editor of Harper's Weekly:

SIR,—In the WEEKLY for February 8 I have just seen an account of the founding of the "Red Cross." The story as told of its origin is true as to its early work in Europe. But its early introduction in America and its origin, in fact, as an organized working force, is not so well known. I am, so far as I know, the sole survivor of the first great movement for human relief here or abroad that would now be grouped under this picturesque name. It is for this reason I briefly tell its story.

The United States Sanitary Commission, beginning as an organization of medical experts for the inspection and improvement of our armies in the field at the outbreak of the civil war in respect of health and general sanitation, early found itself made the recipient of endless streams of supplies of all kinds—gifts of the people for the relief of individual soldiers, and for general use in relief work. By 1863 its technical service of inspection as such had been dropped, and the energies of the commission were thereafter largely devoted to the relief of individual soldiers in various directions—a story already familiar to our people. But to reach the soldiers in the field with the supplies sent or bought with the

great sums of money devoted for such purpose, the "Field Relief" service was organized, having its own wagon trains and its special staff of employees to carry these medical and general supplies to the temporary hospitals set up near the scenes of operation—the so-called division hospitals. The system, though operative, was founded costly and often wasteful. Evidently then, the wagons sent to the front found themselves "out in the air"—the army advanced, the hospitals gone elsewhere, the sick and wounded en route to the nearest town.

In the earlier campaigns this seemed the best that could be done. It was the plan kept up in the West to the end, since great regions were there involved and concentration impossible. Wasteful or not, untold good was done and thousands of lives saved.

When in the spring of 1864 the great movement was begun by Grant with Lee's army as its objective new conditions were evident. There was to be concentration. Continuous attack—"If it took all summer."

This implied a line of water bases upon the Virginia rivers at points convenient for supplies, reinforcements, and return of the sick and wounded. The lines subsequently developed were Fresh-water, Port Royal, White House, Belle Plain, and City Point. To these bases the commission attached its relief work as movements progressed.

In May, 1864, upon the first movements of the advance, the sanitary bureau Elizabeth, of 1000 tons laden, was put in commission loaded to the top of her smoke-stacks with hospital supplies, stretchers, cot-berths, piles of hospital clothing, barrels and boxes of stores of all kinds, the gifts of hundreds of Women's Relief Societies. She carried also a corps of fifty young men regularly enlisted, full outfits for special diet kitchens, each with its trained woman in charge prepared to work independently at division hospitals. It was the business of the barge to keep up with the change of bases and to ambulate them. To meet at all points the needs of ambulances and army wagons coming in with their loads of exhausted and famished sick and wounded, when, as too often happened, the medical service broke down under its terrific strain. This organization was styled the Auxiliary Relief Corps.

The writer was a member of this corps from first to last, until the closing of the last hospital at City Point in June, 1865, and the disbandment of our arms.

Your space will not admit of details. But the history of this great humane movement has never been written. It need not be, but its existence is to be noted.

As a result of this compact organization, aside from the saving of life by a better nutrition, the general standard of hospital life was improved and a higher standard of comfort insisted, the energies of government were efficiently supplemented, and the humane and loving service of tens of thousands of waiting mothers, wives, and sweethearts were carried direct to the bedside of the soldiers in the field.

In January, 1864, the writer succeeded to the direction of this service in the armies of the Potomac and the James, where it had its origin and its highest development. I immediately had the "General" Cross—slare, the world famous "Red" Cross—placed upon each man of the corps just three months after its recognition by the International Conference. We had already anticipated the "neutralization of the ambulance," making no distinction of blue or gray in our ministrations.

The man who originated and worked out this scheme of organization, Mr. Frank B. Fay, of Chelsea, Massachusetts, after a volunteer service beginning at Antietam in September, 1862, lay passed on to his reward. He was, after the close of the war, given the unique distinction of the red, white, and blue button of the Loyal Legion, the only civilian to be so decorated. His devoted ward and assistant, Miss Helen L. Gilson, also of Chelsea, died, after the surrender, of disease contracted in the service, wearing the bronze button of the U. S. A. R. conferred by the State of Massachusetts—an honor never duplicated and richly deserved.

And thus it was that America set the pace that the world has yet to learn to follow effectively. Let us hope it may never again need to learn at so costly a price.

I am, sir,

ANSON M. SPERRY.

("A Minnesota Farmer.")

WHEN THE CHIEF JUSTICE SUBJUGATED THE PRESIDENT

BRANDRETH, MASS., February 27, 1904.

To the Editor of Harper's Weekly:

Sir.—The attacks of the President on the judiciary and fear of a "real despotism" from Executive interference, as expressed in the letter of H. R., are rather oddly composed with the assaults of President Jefferson on Chief-Justice John Marshall to have him interpret treason according to his construction and not the Constitution as seen by Marshall, thereby accomplishing his desire of convicting Aaron Burr of that greatest of crimes against the government—treason. Jefferson made no attempt to conceal his bitterness of feeling toward Burr in his strong desire for a conviction, and in the trial there developed the spectacle of open antagonism between the President of the United States and the Chief Justice, which culminated in the issue by the Chief Justice to President Jefferson of a subpoena to appear and produce certain papers.

Jefferson, very angry, produced the papers, but would not appear. Marshall received a large amount of criticism, but stuck to his interpretation of treason as defined in the Constitution, and the jury rendered a verdict of not guilty under the influence of the opinion of the court on the law of the case. This was a fine

example of even-handed and courageous administration of the law under the embarrassing conditions of "Executive interference" amounting almost to coercion.

Receiving the same number of electoral votes for President as Jefferson, who finally was elected by one vote in the House of Representatives, Burr was considered too powerful a political rival to leave at large, so Jefferson and the double-dealing Wilkinson exerted themselves to the utmost to end the greatest lawyer and politician of his time.

I am, sir,

FREDERICK W. SORLEY.

OUR PICTURE OF TAFT

CARROLL, N. Y., March 29, 1904.

To the Editor of Harper's Weekly:

Sir.—With many others, doubtless all right-minded persons, I feel that I must protest against such an outrageous caricature as appears on the cover of the WEEKLY just received. It is far beneath the dignity of such a paper as my published by the Harpers, and of a man prominent in public life, and who in popular throughout the country.

If I subscribed for the WEEKLY I should discontinue it at once, as I consider it most disloyal to those in high position. But my husband has subscribed for it for so many years he is unwilling to give it up.

I think you ought to apologize publicly and to the public.

I am, sir,

(Miss) F. H. W.

We don't want to apologize, but you still have a remedy. You can subscribe, and then discontinue.—EDITOR.

OBSTREPEROUS SENTIMENTS REBUKED

PLATONIA, February 25, 1904.

To the Editor of Harper's Weekly:

Sir.—May I ask the meaning of the article—on the ninth page of your issue of the 22d—called "Lost Standards"? That there are ignorant vulgarisms who would write such a thing can be imagined, but that HARPER'S WEEKLY would publish an insult to the major portion of its readers is somewhat remarkable.

I am, sir,

MICHAEL MYERS SHUMAKER.

It was the letter of the Missouri correspondent who declared: "There never existed in this country but two sets of decent people—the old-time black-bellied Yankees and the cultured Southerners. All the rest have been mongrels and misdeeds, and unfortunately they run the business and politics of this age." We confess to have been delighted with the obstreperous energy of these sentiments so tersely conveyed, though they are not sentiments which we share.—EDITOR.

THE THREE WILLIAMS TO RUN

LEWIS, MISS., March 10, 1904.

To the Editor of Harper's Weekly:

Sir.—The Presidential contest looks as though it would finally develop into a race with three entries, after several proud States have complimented their respective favorite sons. Of course apparent winners have been leaders before in national conventions, and they may be beaten again. In 1829 Henry Clay thought that he was going to be right, and to be President, too, but the Whigs nominated William Henry Harrison. In 1844 Martin Van Buren was sure of a vindication—until the Southern politicians sprung James Knox Polk upon a surprised country. In 1860 William Henry Seward was positive of a victory, but Providence, assisted by mortal combinations, passed the crown to Abraham Lincoln.

In spite of these and other examples, however, the writer still thinks that the campaign of 1908 will be fought out between the three Williams. "William" means a defender or protector, and the name is quite logical as far as the prospective candidates are concerned. William Howard Taft, being the proclaimed heir presumptive of Theodore Roosevelt, regards himself as the natural and inevitable defender and protector of the Rooseveltian policy. William Jennings Bryan, the human paradox who preaches the rights of everybody while practicing an absolute dictatorship over his party, believes that he has the divine right to defend and protect the Democratic nomination from falling into any hands but his own. William Randolph Hearst, the modern crusader, is ever ready to defend and protect the outraged Republicans and disgruntled Democrats who are willing to accept him as the one man who can lead them into the promised land where none but political snails may hope to enter.

The probable result will be the election of Secretary Taft, the final passing of Colonel Bryan, and the coming of Mr. Hearst. In the event of President Taft being alive and pleased with his job, with no inconvenient financial panics in his wake in 1912, he may have a more serious encounter with the gentleman from New York. Mr. Hearst secured such a large vote for Mayor of the city of New York in 1902 that the Democrats were compelled to induce him for Governor of the Empire State in 1904. He is now ready to play the same game on a national scale. He hopes to pull such a convincing vote as the Independent or Nationalist candidate this year that the Democratic nomination will be forced to accept him the next time. He will certainly bear watching in the near future.

I am, sir,

WILLIAM F. WEICHER.

Prosperity And The Exchange

WHY THE GREAT TRADE MARTS OF THE COUNTRY ARE ESSENTIAL TO THE CONDUCT OF ITS LEGITIMATE BUSINESS

By HIRAM N. SAGER

President of the Chicago Board of Trade

much that is uninformed and unjust has been written in criticism of American exchanges and their methods of doing business, that it seems to the writer to be high time that the public should be given a fair idea of the work done by these marts of trade and their value to the country.

If the public will stop to think of an assassin of criticism, it will not seem at all strange that the most prominent factor in our commercial system, the system which brings buyer and seller together, should be the central target—"the bull's eye"—of the general and indiscriminate fusillade.

President Roosevelt's remarks about curtailing bucketshop methods and purely gambling operations have been distorted into a wholesale condemnation of all trading in the form of future contracts, without which the merchants, manufacturers, transportation interests, and even agriculture, would be paralyzed. Usual traders are misled by it. What President Roosevelt did say was this:

"The great bulk of the business transacted on the exchange is not only legitimate, but is necessary to the working of our modern

of a question of vital importance is the owner of every acre of grain-raising land in this country, and the indiscriminate charges of gambling, defalcations, embezzling, outlooks, etc., described by some writers, many of whom know no such word as responsibility in their utterances. They write very glibly about 'thousands of professional gamblers about the Stock Exchange of New York, and hundreds of thousands who are scattered about the country,' but ask a word do they say about the broad scope of the legitimate features of the grain, cotton, stock, and coffee exchanges as aids in the commerce of the world. They simply take up their pens and brand the entire collection as 'gamblers,' and ask to have the wheels of progress reversed so that they may be able to make the point of their story. Take, for example, one exchange—the Chicago Board of Trade. Whoever heard of gamblers securing a charter from the commonwealth for the purpose of handling \$500,000,000 worth of actual property annually? Whoever heard of thirty-two great railroad lines entering a city of over two millions of people cooperating with a gambling concern, recognizing its authority and rules in the delivery and transfer of 400,000,000 bushels of grain annually? Whoever heard of the State appointing a board of commissioners and conducting a bureau of inspection, at an expense of thousands of dollars annually, to furnish certificates as to the grade and character of the property bought, sold, and distributed at home and abroad by Board of Trade houses, if the institution was for gambling purposes? The same pertinent question may be asked about the regulation and control of warehouses holding the product of vast packing and live-stock interests. Why are the agents of lake and ocean steamship lines, the agents of vast marine insurance interests and representatives of European grain and meat-handling concerns on this exchange if it is conducted for gambling purposes?

Where in all the business world will be found a more rigid code of business morals or a more vigilant supervision of each and every transaction of the year than on the representative exchanges of this country? Yet all are branded by these writers as gambling institutions.

Do the assailants of the exchanges wish to set their opinions up against that of the highest courts in the State and the United States Supreme Court, who have reviewed the transactions in the open markets time after time, after hard-fought legal battles, and always vindicated the rights of the commercial body—the exchange?

I cannot these writers good and unbiassed history? Do they need to be told that this same line of indiscriminate attack was made on the exchanges of the country under the old fluted bill? Do they know that an industrial commission of five United States Senators, five Representatives, and nine other leading men of the country, spent three years' time, following the special act of Congress of June 18, 1890, investigating this entire subject?

With unlimited opportunity, in point of time, and the power to subpoena witnesses, and to visit all sections of the country, this commission, after its investigation into the methods employed to distribute the surplus crops of the country, unreservedly took the ground that future trading is in the interest of the farmer. The report was contemned in by every member of the commission and was signed by the chairman, the late Senator Kyle, of South Dakota, who was originally a strong Granger, and a Populist, but who had been convinced that the old crusade against boards of trade and cotton exchanges was a mistake.

The Floor of the New York Stock Exchange during a Period of active Trading

industrial system, and extreme care would have to be taken not to interfere with this business in doing away with the bucketshop type of speculation."

The President voiced the sentiment of every member of every legitimate exchange in this country in the above words. He knows the difference between real transactions, backed by the product of the country, and the imitation which simply makes wagers upon the quotations that are made by men engaged in actual trade on the various exchanges, and he is frank enough to say so.

The President knows, too, that the leading agricultural action of Europe made a fine political mess of it by restricting open markets on public bourses, and he adds this further warning:

"We should study both the successes and the failures of foreign legislators who, notably Germany, have worked along this line, so as not to do anything harmful. Moreover, there is a special difficulty in dealing with this matter by the Federal government in a Federal republic like ours."

What a contrast there is between this cool, conservative view

Can any man who pretends to write for an intelligent public be blind to the fearful punishment visit of upon the producing classes of Germany by the closing of the bourses of that country a few years ago? Can he be ignorant of the fact that the arguments to close the German exchanges were borrowed from the politicians in this country who tried to force anti-future trading legislation at Washington? The experiment was a dismal failure for the leading agricultural nation of Europe. In 1906 the German government ordered the bourses reopened on the urgent petition of grain refiners. Does this country want to try such a costly experiment? Ask any of the big grain handlers of any exchange, and they will tell you that about fifty per cent. of the year's production is sent forward to market during the four months following the gathering of the crops. If they are honest, they will tell you that only the presence of the open world's markets prevents gigantic combines among buyers, and a lowering of prices from ten to twenty-five per cent. to producers while the rush of marketing is in progress. Once the grain is accumulated at the big centers, this same combine would be able to mark prices very much higher to consumers. It needs no special insight into trade conditions to know that the open market, which the exchange makes possible, is the only barrier to the formation of the greatest trust this country ever dreamed of, with all its blighting effects on the welfare and tillers of American farms.

Much is said about short selling in grain or cotton by those who have not the property to deliver. The penalty for the same under the rules of the exchange is equivalent to that of a bond—the seller has to deliver or must buy back the amount of his short sale in the open market, and thus become a factor in advancing prices to the benefit of the original producer of the grain or cotton, as well as the buyer of futures who anticipates his wants by making contracts months in advance.

It is not easy to understand why so many well-meaning people have a hobby of attacking the exchanges, the public markets of the great centers, and well established modern methods of buying and selling for future delivery. The only reasonable explanation is that notions of legitimate transactions have been allowed to flourish, in the shape of bucket shops and irresponsible so-called brokerage concerns which deceive the public, and are responsible to no one for their acts, as they are outlaws to start with. For a period of years the big exchanges have waged a war on these parasites, with the aid of the various States. Even now, would-be reformers who look only at the surface of things, condemn the whole system of trading in agricultural products simply because they do not know where commercial transactions end, and where imitation and fraud begin. As well might the farmer chop down the fruit-bearing trees of his orchard to get rid of lice and insects that are working damage to his fruit, as for the State or nation to propose the abolishment of exchanges and their open markets because of the objectionable parasites which live upon them, and become a tax upon that credulous portion of the public which patronizes them, even after knowing them to be enemies.

An editorial in an important Eastern paper, re-

The "Wheat Pit" of the Chicago Board of Trade

take their profits, and sales of bulls check advancing markets when they take their profits. In all genuine speculation, the goods actually change hands on the Stock Exchange and then usually do so on the produce exchanges. It is only bookkeepers that merely register bids, and do not trade in real things. Nobody defends "bookkeeping" nor has experience devised any way to prevent the foolish from losing money by the practice. Laws to prevent mistakes regarding markets are, indeed, a long-settled want, but no wit of man has yet devised such a thing.

Every thoughtful man who will study the business of the world as conducted to-day must see that in all lines the future contract is a necessity. The world is fed, clothed, and transported by supplies furnished on future contracts. There can be no possible distinction between supplying grain, flour, and provisions on future contracts and supplying coal, lumber, steel, wool, and leather on future contracts. Any man who knows that the business of the country could not go on for a day if the builder could not buy lumber, the manufacturer buy wool and leather, the railroad buy coal, steel, and hundreds of other things, weeks, months, and sometimes years in advance. For every buyer of future contracts, Sellers have to meet demands of buyers by making future contracts.

The sales are made before the wool is taken from the sheep's back, the hide from the steer, the iron and coal from the mines. Just so, wheat, corn, and cotton are sold before the crops are harvested; sometimes before they are out of the ground. The miller cannot wait until the wheat is on the cars to provide for this output. He sells four months ahead. He must make contracts for his wheat months ahead. The seller (short seller, if you please, until he has the property) is an absolute necessity. America is engaged in feeding and clothing Europe with her surplus grain and cotton. The exchanges, with their facilities for ascertaining crop promise at home on one hand, and foreign needs on the other, enable their members to make contracts with the producers, from whom they buy, and with the consumers, to whom they sell. The whole business is based on future contracts. Back of these contracts stands the exchange with its iron-clad rules offering a guarantee to all the world that the contracts of its members will be faithfully met. If future contracts under the commercial world it is difficult to see how lawmakers can interfere with their operations on legally and honorably conducted exchanges without running foul of the constitutional provision against alien legislation. The problem which confronts the trade and Congress is how to

The Building occupied by the Boston Stock Exchange

The Philadelphia Stock Exchange

do away with the parasites, and their vicious and harmful abuses of grain and cotton contracts, without crippling the enormous business depending on legitimate transactions based on future contracts.

The Supreme Court of the United States, in its decision May 8, 1905, in favor of the Chicago Board of Trade, held that future contracts on the Board of Trade were not gambling transactions, and this court, referring to the Chicago Board of Trade's methods of distributing its quotations to the world, said: "The telegraph companies all receive the quotations under a contract not to furnish them to any bucket shop or place where they are used as a basis for bets or illegal contracts."

Note the prohibition not to furnish them to any bucket shop or place where they are used as a basis for bets or illegal contracts; and yet these bucket shops obtain these quotations in an illegal way and on them they base their bets.

The Supreme Court gave its explanation of what the Chicago Board of Trade was, and said: "This chamber of commerce is, in the first place, a great market where, through its eighteen hundred members, is transacted a large part of the grain and provision business of the world. Of course, in a modern market contracts are not confined to sales for immediate delivery," and then this court referred to speculation in the following words:

"People will endeavor to forecast the future and to make agreements according to their prophecy. Speculation of this kind by competent men is the self-adjustment of society to the probable. Its value is well known as a means of avoiding or mitigating catastrophes, equalizing prices, and providing for periods of want. Legislatures and courts generally have recognized that the natural evolutions of a complex society are to be checked only with a very cautious hand, and that such course attempts at a remedy for the waste incident to every social function as a simple prohibition and laws to stop its being are harmful and vain."

Business enterprise inevitably involves speculation.

Such speculation is utterly distinct from gambling.

It differs in no moral quality from the speculation entered into by the jobber who accumulates silks or woolsens or any other commodity in preparation for an estimated future demand, or from the business judgment used by the contractor who agrees to deliver a great building or workshop at a given price. The former buys on his estimate of future values, the latter agrees to sell short on his best judgment of the future cost of materials and labor.

No branch of business can be broadly conducted without the element of speculation.

Most important, however, to the prosperous progress of a country with a large agrarian population is that character of speculative enterprise which enables the product of the soil to be marketed at the will of the producer at prices in line with the estimates of statisticians as to the average year's value.

Based on hedging sales made possible by the great exchanges of the country, buyers in country districts are able to pay prices figured closely to terminal markets, allowing for its items of freight, handling, and a small margin.

Prior to the existence of these exchanges, prices paid by buyers were far out of line, and the producer frequently suffered from a cash market temporarily dull, or supplies temporarily large at distributing points, either of which conditions, lacking a speculative market, were enough to cut down obtainable prices on country districts from ten per cent. to twenty-five per cent.

A recent illustration of this situation has been seen in the case of the barley markets, in which commodity there is practically no speculative trading for future delivery, and prices for which have fluctuated frequently from twenty cents to thirty cents a bushel, while wheat, corn, and oats have experienced comparatively slight fluctuations.

No market can be broadly maintained without both buyers and sellers who are able and willing to make future contracts based upon their views of future values.

In the few months succeeding the grain harvest the country sends to market the requirements of consumption for a long period; an enormous surplus is stored in sight. Nobody must carry this load. Two classes do this. First, the farmers carry a large part of the crop for varying periods; second, the skilled judges of values on the various exchanges, and their following, carry that part which the farmers do not choose to hold. If such a custom did not exist we should be confronted annually with ten hurtful extremes of value. First, immediately succeeding the harvest, prices would, in the face of a present over-supply, fall to values below the cost of profitable production; later on, however, just before the following harvest, supplies would be exhausted, an eager consumer demand would then find no adequate supply, and as a result values would leap upward to figures distressing to the poor and burdensome to the rich. Consequently, speculation, merely another name for the act of adjusting supplies to requirements, gradually bringing prices, as it does, from one condition to meet another, is of the utmost importance. Speculation then is a natural and legitimate outgrowth of the great system that has been perfected for the marketing of our crops. It is a moderator, checking the greed of holders and placing a firm hand of restraint upon the exactions of buyers. It broadens the market; it makes world conditions the measure of values. It preserves an equilibrium that could be maintained through no other agency, and as carried on under the legal restrictions and judicious regulations of the great exchanges, it is a factor conducive to the general welfare.

If the present safe methods of hedging purchases of grain with sales for future delivery is interfered with, the banks will unquestionably be less willing to furnish the funds to finance the crop movement, as grain collateral would in such event be regarded as less desirable security for loans.

The exchanges, with their facilities for ascertaining crop promise at home, on one hand, and foreign seeds on the other, enable their members to make contracts with the producers, from whom they buy, and with the consumers to whom they sell. The whole business is based on future contracts.

The New Orleans Cotton Exchange

Legislation and Life Insurance

By DARWIN P. KINGSLEY

President of the New York Life Insurance Company

ABAD law is a bad law, although passed in furtherance of a good cause. As a people we exhibit an increasing tendency to remedy every kind of evil by legislation. This is a natural development, because legislation is the chief method through which the instinct of local self-government and the sovereignty of the citizen find expression.

The expansion of thirteen colonies with their earlier and later possessions into forty-six great States, coupled with facilities for transportation and communication that have made it possible to despatch business at an unprecedented rate, has developed problems of government which were unknown a hundred years ago. It is no exaggeration to say that in both State and national affairs important legislation has often been enacted at times of public excitement and under the stress of anger and resentment. There is too little legislation anywhere which is well thought out and really constructive in character. This condition is probably unavoidable; but it explains the initial crudities of our legislation. We usually go too far at such times, and after a good deal of damage has been done we proceed to correct excesses, and we ultimately arrive at legislation which is just and workable.

There is perhaps no more striking example of the operation of these methods than the passage, by the State of New York in 1906, of a new code of insurance laws known as the Armstrong laws.

New York State and New York city had become the life insurance centre of the world. The greatest, soundest, and most successful life insurance companies were located there. Their accumulated assets exceeded one and one-half billion dollars. Their employees were many thousands in number. Their contracts covered the world. They had become institutions whose stores, whose integrity of management, and whose financial responsibility were matters of grave importance to millions of people, embracing the citizenship of about every race and every nation. The public investigation of 1905 uncovered bad methods—methods which may have been common to all estimate life, yet never should have been the methods of life insurance. This aroused a fury of condemnation. Driven by this fury the Legislature of 1906 wrote new laws. In writing laws hastily, under the pressure of public opinion, the Legislature did what every such body has always done; it struck hard and directly at admitted evils; it had no opportunity—and perhaps at that time little disposition—to take care that the innocent did not suffer with the guilty.

I maintain that a part of this legislation has already done great injury to life insurance, and is certain to work incalculable damage unless its excesses are soon corrected. Moreover, it will almost certainly discredit its own moral achievements—which are great—unless its unsound doctrines are speedily eliminated.

One instance—already closed and but little discussed—shows the evils of hasty action. In order to prevent the recurrence of certain methods employed by the larger companies in making investments, the law governing life insurance investments was rewritten. It was rewritten along special and narrow lines. It drove directly at practices which had been justly enough condemned. It went so far in its specific prohibition that when, lately, a certain street railroad bond, largely held by the life companies of this city, defaulted in its interest, the companies found themselves denied the right to exercise the salvage measures universally resorted to under such circumstances. A relief bill was proposed, rushed through the Legislature, and signed upon the last day of grace but one. The amounts involved reached into the millions, and if the default had occurred when the Legislature was not in session, heavy losses would almost certainly have followed.

This instance and the investment law do not, however, go so directly to the economic unsoundness of certain sections.

Section ninety-six, section ninety-seven, section eighty-seven, section fifty-three, and some others, are all economically wrong, and unless repealed or modified will result in large losses to policy holders.

Section ninety-six arbitrarily limits individual and corporate activity; it is a plain combination in restraint of trade. Its logic would compel people to take insurance in certain companies by denying them the right to take it in other companies, even though those companies may be the soundest and the most economically managed. It involves a dangerous and un-American invasion of private rights. It strikes at all citizenship, because while it here arbitrarily limits life insurance production, it may to-morrow be exercised through another enactment against any form of business activity.

In section eighty-seven the State undertakes not only to regulate but to administer the details of business. It is about the latest attempt to fix prices and control by law. It not only limits the wages of the soliciting agent, but it fixes narrowly when the agent shall be paid and how he shall be paid. It in effect not only limits the total he shall receive, but compels him to wait from three to nine years for a large part of his earnings. It has resulted in driving more than ten thousand men out of the insurance business in eighteen months.

Section eighty-seven is thoroughly bad. It coerces the judgment of trustees, and compels the annual distribution of assets in the

large companies down to limits that are insufficient for safety. The law otherwise fixes a minimum of assets which a life company must have or be insolvent. This section fixes a maximum, to exceed which is criminal. The fluctuation of first-class bonds within twelve months has—for the largest companies—compassed the difference between the line of solvency and that of criminality nearly two to one. This section should be wholly repealed.

Section fifty-three puts a snare on the business of life insurance. It pillorises life insurance men as being a class likely to indulge in improper practices, and makes any infraction of any part of the insurance law a misdemeanor.

Lately a wave of indignation swept over the Regular Army because a regulation was adopted which takes the finger-marks of all recruits, merely because some soldiers desert, and the finger-marks are valuable always in the identification of criminals. Small wonder that men rebel at being rated as criminals because some men have been unfaithful. Life insurance men rebel at a similar brand.

All these sections and some others are the expression in law of a false premise laid down in the report of the Armstrong committee. The committee declared their conviction that certain life companies had already become so large that no good purpose would be served by their further growth. Then they recommended such legislation as would make their assumption effective. They succeeded. They have stopped the growth of the companies named, and the growth of all other companies which are equitably and fully affected by the laws.

At the rate of gain recorded by the companies operating in New York State at the close of 1904, maintained through 1905-6 and 7, the life insurance risk of those companies would now be \$2,000,000,000 more than they are. This represents about 750,000 families without insurance who might otherwise now be protected. What does the presence or absence of such a volume of good insurance mean to the State—to the world? It would make a company as large in risk as the largest now in existence.

Personally I doubt if the companies could have maintained the rate of growth recorded in 1904 and for some years previous thereto. The insurance risk was so vast that natural wear and tear would have reduced the ratio of gain. I doubt, also, if legislative action sufficient to stop unquestioned abuses could have been taken without some considerable shrinkage for a few years in the annual output. But all this is one thing, and the slaughter which has followed the enactment of the Armstrong law is another.

Section ninety-six and section ninety-seven and section eighty-seven are invasions of private rights. The State has power to destroy; but the people mean to be very careful how that power is exercised. These sections vary from direct to indirect destruction of individual opportunity. They are imposed, because the premise from which they are drawn is un sound.

Under full publicity the people do not fear any honestly created corporation, however large or successful it may be. The Armstrong committee was seized with a recurrence of the fear that gripped the Legislature of this State in 1834 when it decreed that the New York Life Insurance and Trust Company should never be allowed to receive on deposit more than \$5,000,000. To the good people of that day obviously anything beyond \$5,000,000 was "a public menace." I can imagine that in the debate attending this enactment it was gravely stated that no useful purpose will be served by its becoming larger, and that "the question of responsible control and conservative management will soon become one of extreme difficulty." (Paraphrase from the Armstrong Report, p. 282.)

It is perhaps now time to say that the avidity with which the public seized upon the insurance disclosures of 1905 is not explained by reference to the sensational methods of the yellow press and the general willingness of men to listen to scandal.

The public had long been offended. There had been too much strutting and bragging; too many acts on the part of leading life insurance men which violated the proprieties. That a feeling of resentment over such things can pervade all through public thought is a fact that does not need proof. It extends now toward a small and really unimportant section of the community which poses as "society." All it needs to become a fearful instrument of destruction is opportunity. The opportunity always comes sooner or later.

But the offensive and the wrong things in life insurance in 1905 no more represent life insurance itself than the so-called leaders of society represent the great body of the people.

It is just as unwise, just as unstatemanship, to cripple and limit and smother life insurance because of the resentment which the public felt in 1905, as it would be to abandon manhood suffrage or the right of private property because of the scandal and degeneracy of "high society."

The legislation of 1906 strikes kindly at certain demonstrated evils. It stops certain practices, and it stops growth. It is in parts un sound, unwise, un-American. It needs quick revision. The question is, will the Legislature get it out and prevent heavy losses to the State; or will it wait and act after a clear mandate from the people—which will come as soon as these laws are understood and their effect is clearly in evidence.

The Invisible Navy

By ROBERT G. SKERRETT

The "Emeraude," the latest type of French submarine
TO OFFSET HER LOW FREEBOARD SHE HAS BEEN FITTED WITH AN EXCEPTIONALLY LARGE CONNING-TOWER

HE partisans of the submarine type of naval vessel have precipitated a pretty wrangle in Congress by dropping two of the four battleships recommended by the Navy Department, and substituting in their stead an additional number of under-water craft. Apart from raising a rumpus in the Capitol, this action has fostered widespread and erroneous ideas concerning the real value of submarine vessels.

Whatever may be the present fighting worth of the submarine boat,—and it has an admitted value,—it would be hard to find a serious-minded student of naval affairs willing to jeopardize his reputation by comparing the fighting efficiency of the submarine to that of the modern battleship. The battleship and the submarine boat have distinct fields of usefulness, and the standard of naval power is now and probably always will be based upon the number of battleships available. Should Congress, however, provide for more submarine boats, the field should be open to all builders and inventors because of the rapid developments that are taking place; and it behooves the American people to know something about the present state of the art in this new field of naval construction.

Only a few years ago all under-water boats were called submarines, and so effort was made to indulge in precise distinctions. This prevailed until 1897, when Monsieur Laureud of the French navy brought out his boat, the *Narval*, which, by way of designation, he termed a "Submersible." His idea was to characterize his craft as a vessel that might be submerged, but which ordinarily was to run on the surface, and to have there much of the outward appearance common to the French torpedo boats of that date. Monsieur Laureud had built the *Narval* in competition with the other submarine *Gastone Zédé*—a vessel lying very low upon the water, built with a eiger-shaped form of hull, and possessing very limited endurance and habitability. Because of her form of hull the *Gastone Zédé* also had a tendency to plunge head first when running submerged, and despite improved methods of control it has never been possible to make her run with less than an inclination of five degrees. When pitching and rolling she frequently split the air out of her batteries, and this made the atmosphere within the boat quite unbearable. In order to give his vessel sea-keeping qualities, Monsieur Laureud shaped her hull like that of a surface craft. This gave her a considerable measure of freeboard or body above water, and offset the inherent tendency to dive peculiar to the eiger-shaped hull. In addition to this, he fitted his boat with hydroplanes—side fins, or submerging rudders, symmetrically disposed forward and aft, and by means of these he was able to force the *Narval* under water on an even keel, thus avoiding all risk of spilling the electrolyte out of his batteries or assuming hazardous inclinations.

All submarine vessels are brought to a condition of readiness to submerge by taking in water ballast in suitably arranged and controlled tanks. This causes more of the boat to sink below the

water's surface, and finally leaves her with only a small part of her conning-tower out of water. The remaining part above water represents what is called "reserve buoyancy." This buoyancy varies generally from two hundred to a thousand pounds, depending upon the size of the craft; and it is to overcome the permanent tendency to rise represented by this reserve that pressure is brought to bear upon the submerging rudders or the hydroplanes in order to make the boat sink after she is once put in motion.

Now, the amount of water that must be taken into a submarine vessel to bring her body sufficiently below the surface for readiness to dive constitutes one of the two prime distinctions between the submarine and the submersible. In the submarine only from five per cent. to twelve per cent. of her total submerged bulk lies above the surface when she is in her lightest condition, and, accordingly, nearly that percentage of water ballast must be pumped into her tanks to bring her down to the required condition preparatory to running submerged. In a submersible, on the other hand, two, three, and even four times this percentage of water ballast must be pumped into her tanks in order to reduce the vessel's reserve of buoyancy so that she may be forcibly made to sink out of sight. It is the height out of water or reserve of buoyancy of the submersible which gives her her superior sea-keeping qualities, which permits the vessel to be driven safely on the surface at higher rates of speed, and which contributes in other ways to the efficiency, the habitability, and the military value of the craft.

The second prime difference between the submarine and the

submersible lies in the form of hull. As the great bulk of the true submarine always lies below the surface, the first aim of the designer is so to form that hull that it will offer the least resistance to the water. Experience has proved that a eiger-shaped body is the best for this purpose, but it is not the best for surface navigation. The submersible, on the other hand, relying primarily upon its surface speed to cover long distances that she may the sooner reach the field where she must act as a submerged craft, has a ship-shaped body which enables her to attain this end better than the submarine.

The British Submarine "B-10"
THIS VESSEL HAS A PARTIAL SUBMERGIBLE HULL UPON THE MAIN BODY OF HER EIGER-SHAPED HULL. THE SAILING ON THE LEFT OF THE CONNING-TOWER IS STANDING ON THE "SEABOARD HYDROPLANE," AND BEFORE THE VESSEL CAN BE MADE TO RISE THESE HYDROPLANE MUST BE UPRIGHT

When running submerged, however, this form of hull offers more resistance to the water than that of the eiger-shaped body. The submersible can go farther seaward, can hold her station longer, and can face weather conditions that would put a submarine out of action. While her submerged speed is less than that of a submarine of corresponding displacement, yet she is a far more formidable craft because of her wider field of usefulness and the measure of habitability and comfort that her sea-keeping facilities assure her crew.

When the submersible was first designed, her great reserve of buoyancy promised to be a serious handicap because of the length of time taken to fill her ballast tanks with the measure of water needed to bring her into readiness to run submerged. In the earlier French boats this took nearly half an hour, as compared with the five or six minutes required by the submarines of that date to reach the same stage. Improved pumping facilities and a

better system of handling these large volumes of water have revolutionized this feature, and in the comparative tests between the submarine *Z* and the submarine *Aigrette* of the French service in 1903, the latter boat actually beat the submarine in this very particular. Since then France has concentrated her efforts upon the development of the submarine.

In 1902, Great Britain was forced, by reason of French activity in the field of submarine navigation, to subscribe to popular demand, and a certain number of modified boats similar to our vessels of the *Admiral* class were ordered by the British Admiralty for experimental purposes. Almost before the last of this initial group of five was finished the British naval

A Submersible being built for Russia
THIS VESSEL IS ONE OF A NUMBER NOW
UNDER CONSTRUCTION AT ST. PETERSBURG

THIS IS ONE OF THE EGG-SHAPED TYPE OF UNDER-WATER VESSELS ON
THE BASIS OF WHICH SO MANY OF THE SUBMARINES HAVE BEEN BUILT

authorities had undertaken improvements on their own initiative, and the *A-1* was the pioneer vessel of the so-called "Admiralty" type. The *A-1* was not a thoroughly satisfactory vessel, but before her fatal sinking in 1904 she had satisfied the Admiralty that they were making departures in the right direction. They had bought the experience paid for by the United States government in developing the *Admiral* class, and our British brothers were solvent upon getting ahead of us. The rest of the boats of the "A" class—twelve in number—contained various improvements, but all of them retained the egg-shaped form of hull, with its limited stability and its hazardous tendency to plunge voluntarily; and all of them were characterized by the very moderate portion of their bodies remaining above water when the vessels were in their lightest trim. The speed of these boats had been steadily increasing, and yet nothing had been done to raise their bows out of water, so that, when running rapidly, the mass of the bow wave should not fall on the vessel's upper body and tend to weight her down by the head. This omission was given fatal emphasis by the sinking of the *A-1*. That vessel was running in a smooth sea at a speed of ten knots an hour and with a considerable reserve of buoyancy. Her stern had been made to dip a couple of degrees in order to bring her bow up, and yet the volume of water sweeping upon her deck forward forced the boat under before her engines could be stopped, and fifteen lives paid the penalty.

In the succeeding boats of the "A" class, and in the later vessels of the "B" and "C" classes, a superstructure of limited proportions was built upon the egg-shaped body of the main hull. The primary intent of this was to increase the reserve of buoyancy in the light condition, to raise their bows to rise more easily to the sea, and to make the boats more stable and less liable to dive voluntarily when running on the surface with their buoyancies somewhat reduced. Model tank experiments in this country had previously disclosed this tendency peculiar to the diving boat with the egg-shaped form of hull.

In order to obviate as far as possible the angle of dip needed to drive the diving boats of the "A" class initially under water, the British authorities placed a single pair of hydroplanes on the vessels of the "B" class, and located them in the middle of the boat just forward and near the bow of the conning tower. They projected horizontally—one on

each side—like a pair of short, broad oars. They were intended to supplement the diving action of the diving rudder at the stern, by causing the vessel to sink bodily. They did not exercise any control over the vessel's horizontal trim. However, they constituted an improvement.

The diving boat goes under water head first by reason of the tilting action of horizontal rudders placed at the stern of the vessel, and to give this type of submarine facility in this maneuver the craft is purposely made unstable in a fore-and-aft direction, and in this particular may be popularly likened to a slightly sluggish scow. The disadvantages of this method of getting under water increase as the vessel grows longer, and it becomes a still more serious matter as the vessel's speed is raised, and especially so when operating in waters of moderate depth. The even-keel boat simply goes down on an even keel and assumes none of these dangerous angles; and, unlike the diving boat, she works better the more stability she is given.

In time of serious stress the best-trained man is liable to err. In the case of a diving boat running at high speed submerged this might cause the vessel to assume a dangerous angle of inclination and either to strike the bottom or to invite peril in a number of different ways. The same oversight or lapse on the part of the man in control of the hydroplanes of an even-keel boat, however, would result merely in the vessel going slowly deeper without changing the direction of her line of motion. The diving rubber-man must be skilled by months of careful training in his office of balancing the great scow which his vessel virtually becomes; while the hydroplane man can be taught all that is required of him in a few hours, and his task is quite as simple as that of controlling a slow-speed elevator.

Within the past year France has increased her force by ten submarines. Austria has ordered two more, and Norway has ordered one. England has ordered sixteen more submarine vessels, and thirteen of these belong to the "D" type, which are more nearly submarines than submarines; while the United States has ordered seven more submarines and a single submersible. It is to be hoped that the advent of this single submersible in our submarine fleet marks the beginning of a serious official determination to test the relative merits of both types.

The London "Times" and its Directors

THE MEN WHO WILL CONTROL THE FUTURE OF
ONE OF THE GREATEST OF BRITISH INSTITUTIONS

THAT staid old ship of English life, the London Times, has emerged with triumph from the sea of troubles that has lately beset it. The institution of the Times book club, some two years ago, resulted in a war with every publisher in the United Kingdom, and the withdrawal of publishers' advertising was an important factor in the financial troubles which followed. When reconstruction of affairs had become necessary, Cyril Arthur Pearson, the newspaper proprietor, led his forces to capture this reef of odd-fashioned conservative orthodoxy by the name of Protection. This act aroused a storm: not, characteristically, because of Mr. Pearson's politics, but because he was a newcomer in the newspaper field, whereas the Times had become sacrosanct through generations of Walters, its owners. The storm drifted the Times into the hands of a new company: Mr. Pearson withdrew, and Mr. Moberly Bell retains his powers and becomes managing director.

The Representative of the Walters

The chairman of the company will be Arthur Fraser Walter, present principal proprietor of the Times, and the direct descendant of John Walter, the founder of the paper. By an arrangement with the present partners previous to his death the father of Mr. Arthur Walter practically made him manager of the Times for life. As chairman of the new company Mr. Walter will continue to hold the same relationship to the paper that he has always done. He and his brother, Mr. Godfrey Walter, are both men of ample fortune and extensive interests aside from the Times, though they each give the paper considerable attention and thought. The actual management, however, has always been left to Mr. Bell, Mr. Buckle, and their able corps of assistants. Mr. Walter has a fine estate of two or three thousand acres at Bear Wood, where he has entertained people of distinction from all parts of the world. It is a model estate, and to it Mr. Walter produces and raises almost everything that is needed for daily use. He cuts and sows his own timber and manufactures it into doors and windows. He makes his own bricks, but is more smelly and machine shops, and does much of the building for the tenantry.

Over the estate is a picturesque little church in which the master of Bear Wood takes a great interest, and not infrequently relieves the doctor by reading the lessons himself. Bear Wood is a large mansion of red brick and gables, with an effective tower and many bow windows and creeping vines relieving the monotony of its vast frontage. The fact that nearly one hundred guests can be comfortably put up here for the week-end gives some idea of its size. There is a fine picture gallery containing rare paintings, and the corridors are filled with famous old prints, originals of cartoons, and other souvenirs of the many historical and political campaigns in which the Times and its proprietors have figured during the century or more of its existence.

Mrs. Walter takes a great interest in the extensive hothouses and garden, and spends much of her time sketching and adding to a collection of rhinoceri which already embraces some famous historic services. Aside from the innumerable responsibilities which rest upon the mistress of such an establishment Mrs. Walter's talent as hostess is lavishly taxed in the large house parties for which Bear Wood is famous.

Personally Mr. Walter strikes you as a direct-spoken man with a clear head and strong grasp of all the questions of the day. In essentials his personality, but in considerable extent, dominates the Times. In details he rarely interferes. If he disagreed with the policy of the paper on a given question he would not necessarily order it changed, but would endeavor by argument, reinforced perhaps by men of great authority on the debatable question, to bring the editor around to his view.

Moberly Bell and His Achievements

C. F. Moberly Bell, who now becomes managing director of the Times, has been connected with the paper as foreign correspondent and assistant manager for over forty years. From 1845 to 1859 Mr. Bell was the Egyptian correspondent, and distinguished himself not only for his newspaper capacity, but in the broad treatment of all the questions of far-reaching importance which came up between Great Britain and Egypt in the stirring times covering this period. An English gentleman now in America said in the writer the other day: "Our control of Egypt is of incalculable value to the Empire. If there is one agency in which more than any other we are indebted for that control it is the Times, through its former representative in Cairo, Moberly Bell. As one behind the official scenes of Egyptian matters both in Cairo and in Europe from 1855 to 1884, and connected therewith, I speak from personal knowledge. The full story of the Egyptian occupation has yet to be written, and when it appears I

think that you will find that it will show conclusively the extent to which the British Empire owes her unrivalled position on the banks of the Nile and her mastery of the highway to India to the Times—and more especially to the work done as its representative in Egypt by Moberly Bell." Mr. Bell is the author of several interesting works on Egypt, among them *Khedives and Pashas*, *Egyptian Finance*, and *From Paros to Fellah*. From 1880 to the present time he has directed the business affairs of the Times, and his personality has undoubtedly been recognized as the strongest of the staff in the conduct of the paper. While the organization of the Times office makes the editor absolute dictator as to its policy and of what is printed in its columns, Mr. Bell has by reason of being a trained journalist of ability always exercised an advisory relationship, and has taken considerable interest in the editorial and the financial departments, and naturally enough in the foreign correspondence. His wide circle of acquaintance among people of affairs in England and throughout Europe and America has made his hospitable home on Portland Place known and appreciated not only to British statesmen, soldiers, and men of letters and science, but to foreign celebrities of all sorts and kinds. Though turned sixty years, Mr. Bell is as young as only an Englishman can be at that age. Of untiring energy and of that temperance which endures the great strain of journalistic work with equanimity and cheerfulness, he retains all the keenness of wit and optimism characteristic of his early manhood.

Mrs. Bell during her two visits with her husband in this country made many friends. She is known in London as an exceedingly clever woman, a linguist, a lover of art and literature, and as one who has won distinction as a French scholar. She has also that tact and quick sympathy which have enabled her to attract the best element of society to her drawing room.

The Man to Whom All England Turns

George Earle Buckle, with the exception of a few years spent as a Fellow of All Souls College, Oxford, has devoted his life to the Times. He is a barrister of Lincoln's Inn, but never practiced, and entered the office of the Times on the editorial staff twenty-eight years ago, to be appointed editor a few years later. Mr. Buckle is a scholarly man and has undoubtedly kept up the tone and dignity of the paper, especially of the editorial or leader page, as it is called in England. Partly on account of the tradition of the office, and partly because Mr. Buckle is himself a man of natural reserve, the editor of the Times has never figured largely in public. He is less known and more seldom seen at official functions than either Mr. Walter or Mr. Bell, but his influence within the office in guiding the editorial policy of the paper is real and final. Like Mr. Bell he is a man of large stature and enormous capacity for work. Golf is his chief form of recreation, and it is an unusual weekend that does not find him on the golf links. Frank and plain spoken, inclined to heartiness, and fifty-four years of age, Mr. Buckle has the loyalty of getting the best out of his staff with the least possible amount of friction. The machinery of the office moves, and moves effectively, too, without seeming to move. There are men on the Times staff who have worked under Mr. Buckle now for nearly a generation, and are devoted to him, and will rejoice that his able direction of the editorial department of the paper is to continue.

Two of the Associate Directors

Valentine Chirol, who will be the fourth director, was also a former correspondent of the Times. He succeeded Sir Donald Mackenzie Wallace as director of the foreign department in 1899, and is a factor of great influence on the staff. For some years Mr. Chirol was Berlin correspondent. He has won distinction as an extensive traveler in European and Asiatic Turkey, Egypt, Persia, and the Far East. He has many friends in this country—whom he has visited several times—among statesmen, scholars, and journalists, and his books on the Far Eastern and Middle Eastern questions are well known and regarded as works of authority. He is a lover of art, especially Oriental, and his rooms in Queen Anne's Mansions are filled with rare and beautiful things. Mr. Chirol is an engaging personality as his eminent predecessor, and the new organization has shown wisdom in thus more closely identifying Mr. Chirol with the paper.

William Flavelle Monypenny, the fifth director, is also a journalist, but his specialty will undoubtedly be matters relating to South Africa. Formerly assistant editor of the Times, he resigned some years ago to accept the editorship of the *Johannesburg Star*. On the outbreak of the war he obtained a commission and served in many capacities with distinction. Subsequently he became Director of Civil Supplies, but in 1913 returned to England, just as the war was breaking. Mr. Monypenny, comparatively a young man, being little over forty years of age.

The Vanishing French

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

LONDON

IS it true that Mr. Roosevelt has denounced the recall of M. Jaurès on account of the falling French birth-rate? No; of course it is not true. I dismiss the rumor as the invention of some enemy. But at the same time I cannot help regarding it as an unfriendly action on the part of the French Republic towards the Chief Magistrate of the United States that the French population should remain all but stationary. Considering his well-known views on the subject, a nation that wished to cultivate good relations with America ought surely to make a point of showing a handsome surplus of births over deaths. There is something a little tactless, something that borders almost on studied insult, in the persistency with which the French declines to add to their numbers. I can imagine Mr. Roosevelt reading the French census figures for 1906 that were published the other day, sending at once for M. Jaurès, declaring that the thing was terrible, and that he could no longer stand such open defiance of his commands, and offering that most alarming of ambassadors the alternative of resignation or dismissal. If nothing of the sort has happened it speaks well for the President's self-restraint. For the figures that came out a short time ago are a clear and wanton provocation.

France's Most Anxious Problem

These figures lay bare one of the oldest and most anxious of the problems of France—her dwindling population. Dwindling is not quite the right word, because the population of France does not really decrease; it remains stationary or nearly so. If there were no immigration there would be a positive decline, but the Germans, Belgians, Swiss, and Italians who for some years have been flocking into France, maintain the net population at just a little above parity. Were it not for them, the French population might in time come to show a positive recession. The figures of 1906 point to a very considerable falling off in births below the average of the preceding ten years. But for the present it is only relatively, and not actually, that the French birth-rate lags behind. It grows, but nothing like so quickly as the birth-rate of neighboring and possibly rival nations. In 1906, for instance, the populations of France and Germany were practically the same. To-day France has 39,000,000, and Germany 42,000,000. In the past fifty years the population of France has increased by only four millions, and that of Germany by twenty-six millions. If 1906 were to be accepted as a criterion, one would have to conclude that Germany is generating more than thirty times as many units of man-power per annum as France. In another decade it is calculated that Germany will have twice as many conscripts as France. "Then she will begin to devour us," say the French alarmists, and the fear of being devoured lies near the root of their anxiety over the question of depopulation.

The Most Old-fashioned Man on Earth

"All that I know about President Roosevelt," said to me the other day a very distinguished sociologist, "is that he is the oldest-fashioned man in the oldest-fashioned community on earth. His policy of obstinate individualism and his views on race-suicide have taught me that." I think for myself that is putting it somewhat strongly. But there can be little question that the best minds of England and of Europe are altogether against the President as the general problem of population, and regard his admissions as both socially and economically pernicious. There is a passage in Mr. John Morley's *Rousseau* which I will venture to transcribe, as it bears inferentially on this point. Rousseau, as every one knows, put away his new-born children, one after the other, in an asylum for foundlings—"and with such entire absence of any pretension with a view to their identification in happier times that not even a note was kept of the day of their birth." Mr. Morley, after discussing the ethics of this "unholy work," winds up: "And, at any rate, let Rousseau be a little free from extensive reproach from all clergymen, sentimentalists, and others, who do their worst to uphold the common and rather bestial opinion in favor of reckless propagation, and who, if they do not advocate the dispatch of children to public institutions, still encourage a selfish incontinence which ultimately falls in burdens on others than the offenders, and which turns the family into a scene of squalor and brutishness, producing a kind of parental infirmity that is far more disastrous and demoralizing than the absence of it in public institutions can possibly be. If the propagation of children without regard to their maintenance be either a virtue or a necessity, and if afterwards the only alternatives are their maintenance in an asylum on the one hand, and their maintenance in the degradation of a poverty-stricken home on the other, we should not hesitate to give people who act as Rousseau acted all that credit for self-denial and high moral courage which he so uncharitably claimed for himself. It really seems to be no more criminal to produce

children with the deliberate intention of abandoning them to public charity, as Rousseau did, than it is to produce them in deliberate reliance on the besotted maxim that He who sends mouths will send meat, or any other of the spurious saws which make Providence do duty for self-control, and add to the gratification of physical appetite the grotesque luxury of religious unctiousness."

A Future Ideal State

Another English thinker, even more original and with a wider speculative sweep than Mr. Morley,—I mean Mr. H. G. Wells,—has made the rejection of the common and Rousseauian views on race-suicide the very foundation of the future ideal state. He altogether subscribes to the Malthusian opinion that a state whose population continues to increase in obedience to unchecked instinct can progress only from bad to worse. "From the view of human comfort and happiness," he says, "the increase of population that secures at each advance in human civility is the greatest evil of life," and in *A Modern Utopia* he has brilliantly expounded the workings and principles of a system of competitive selection in the propagation of children. All countries more or less are discussing some aspect or other of this immense problem. It is, of course, as ancient a problem as mankind itself, but it is at last being approached with sense and responsibility. If it might attempt to summarize what the most enlightened observers have said and thought about it, I should say that the world is gradually nearing these conclusions: First, that race-suicide, in the sense of a conscious limitation of population to the means of subsistence and to the definite standard of living, is not, when practiced by a nation instead of by a small and well-to-do class, to be construed as necessarily a sign of decay or degeneration, but may be the starting-point of a far higher civilization. Secondly, that its causes are at bottom economic, complicated, and intensified by a vulgar set of social ideas. Thirdly, that the "remedy" is to be sought not in any specific legislation, but in a wide and long-continued effort to promote a greater equality in the distribution of wealth, and to transform the very nature and essence of the average man's social ambitions. Fourthly, that it is the duty of the state to ensure, even by the most drastic enactments, that those who fail to reach a certain minimum of age, health, physique, economic efficiency, and mental development, shall be permitted to add to the population of the state. We are, of course, a very long way from the time in which these conclusions will be accepted and acted upon by the common sense of mankind. But that the best thought of the world on this matter is moving in these directions, and no others seems to me unquestionable.

A Nation of Small Land-owners

In France the limitation of offspring is more widely observed than in any other country. Those who do not observe it are either the destitute poor in the country districts—especially districts like Brittany, where the Church is strongest and her teachings most faithfully obeyed—and the heedless and improvident poor in the towns. The great bulk of the French people are Malthusians by conviction and temperament. Indeed, it is difficult to see how any people who have incorporated into their legal code the principle of forced testamentary division of property can be anything else. Napoleon borrowed the idea of this enactment from Montesquieu and established it in the framework of French law. It would be an interesting study to work out its social, economic, and political effects. It has made France a nation of small landowners; it has encouraged vital stability and conservatism and checked the growth of a "submerged tenth"; it has also contributed indirectly but powerfully to the spread of *le fourgonneurisme*, and it has operated as a brake upon migration and colonization. But above all things, it has imposed the necessity of limiting the population. When you are obliged by law to divide your property equally among your children, and when you know that the same restriction will be applied to your children when their turn comes, you naturally and inevitably elect to have a small family. After a few generations of constant dividing and parcelling out of estates, whatever their dimensions, the peasant proprietors, if they would hand down more than a square yard of land, are forced to renounce all hope of more children. There comes a time when even the largest estate may be so subdivided as to afford adequate support to no one. Then, again, the dowry system operates in the same direction. In all countries an extra child means extra expense; in France it means an extra fortune, and that is a very powerful reason why the French have few children. Another kind of "solution" has been suggested, but against the ingrained compactness of the French family, which is patriarchal in spirit if not in numbers, and against the ingrained instinct of thrift, they have all dashed themselves in vain. France will continue to cut her coat according to her cloth, to regulate her population by her resources and her well-worn social structure. She will remain the placid, prosperous, provident, and strictly limited country that we know.

The Youngest Archbishop of a Hemisphere

THE recent elevation of the bishopric of Yucatan, Mexico, into an archbishopric, and the imposition of the pallium as the formal religious rite denoting the raising of the bishopric, was a matter of great interest, not only to the Catholic Church, but to the student of secular history as well.

The event brings into prominence the story of the oldest bishopric of the Mexican republic, or New Spain, as the country was called at the time when this see was instituted. It is a story as strange as any of the old episcopal sees in the Americas.

Just off the northeast coast of Yucatan lies Comuel, the "Isle of Swallows." It is the habitat of fishermen and turtle hunters, and never was anything else; yet in the year 1518 the Pope raised it to the dignity of a bishopric and bestowed it upon a distinguished prelate, as a more lucrative bishopric and greater honor than the bishopric of Culhua, now Mexico, the richest see in all the land of what was then New Spain.

Here are the events which led up to an occurrence of such notable character:

In the year 1511, when Vadilva and his following were on their way to Spain from Darien, not far from Jamaica, a sudden tempest drove them out of their course, and so ill-used them that only a few managed to reach the nearest land in a leaking boat, where exposure and ill treatment by native raptors caused the death of all but two.

The land on which these sea-tossed waifs were thrown was that which is now called Yucatan. It was then unknown and uninhabited by white men, although one of the old companions of Columbus, the pilot Pinzon, claims to have sailed along the coast, and to have seen it from his vessel, in the year 1506.

In the March of 1517, Francisco Hernandez de Cordova sailed from Santiago de Cuba to discover new lands. On the 4th of that month he sighted what is now known as Cape Catoche. Continuing along the coast, when near the river and native town of Champoton he was attacked by the assembled Maya natives and severely routed. Returning to Havana with the remnant of his forces, he died a few days after his arrival.

In the following year, 1518, the young and energetic baidago, Juan de Grijalva, sailed from the port of Matanzas, Cuba. Like Cordova, he sailed to discover new lands and, if possible, much gold. He skirted the coast of Yucatan and, on the 6th of May, 1518, discovered a large island but at a short distance off the main land. More fortunate for a while than Cordova, he was hospitably received by the natives of Comuel, or Island of Swallows, as they called their land. He visited the chief personages of the place, which was apparently sacred to its inhabitants and contained many shrines, statues, and temples.

In one of these, the priest Juan Diaz, belonging to the expedition, said mass, without any opposition from the natives. This done, Grijalva and his followers sailed away for new fields. As they passed the island shores, so the official chroniclers told in their reports to king and Pope, they counted no less than fourteen towers in sight.

Now the term towers, in old Spain and older Rome, conveyed the idea of moated castles, turreted embankments, and temples, as well as the rich and flourishing population that naturally accompanies such imposing structures. This was the impression that was evidently, and perhaps purposely, produced upon the minds of the Spanish king and Roman pontiff by the chronicle of the voyages of Grijalva and, later, those of Cortez.

Under these circumstances, it was not so ludicrous that the first bishopric of Yucatan should have been erected upon an almost uninhabited island, and then given, as a coveted prize, to a person whom both Pope and King desired greatly to honor.

The cathedral of Yucatan, in Merida, is one of the most imposing and satisfying examples of ecclesiastical architecture in all Mexico. In striking contrast to the richly ornamented facades of

some other cathedrals in the republic of Mexico, this of Merida is striking in its austere simplicity, and so typical of all that a religious edifice should exemplify. The later cathedral, built to replace the primitive one, had cost, at the date of its completion in 1598, over three hundred thousand dollars, which was in those days a very large sum.

Since then large amounts have been spent from time to time, mostly upon the interior of the edifice, so that the result is an immense surprise to the casual visitor, who is ill prepared by the plain exterior for the magnificence of the interior.

To look down the nave, the dim vista of sept and transept between the multitude of smooth great round columns makes one think of the first cathedral that nature built for man to worship in, the arcades of the forest primeval. The high altar surrounded by the religious symbols, the receded back of the many altars, are each and all magnificent examples of old wood carvings. They are covered with thick gilding and toned by time to a rich old gold effect. The carvings were in their day worked upon by artists impelled by love of their work and reverence for their religion, as well as for the kins that they received. This art is recognized by the authorities of the cathedral, and most of the later work has been of a nature not calculated to produce the sometimes startling anachronisms so often found in the interiors of religious structures in Mexico and South America.

Dr. Martin Tritschler y Cordova, since the 31st of July, 1909, thirty-ninth bishop of Yucatan, was born on the 28th of May, 1868, in the town of San Andres Chalechucum, State of Puebla. His father was a German merchant, Martin Tritschler, who in the last half of the nineteenth century came to Mexico, married a very estimable lady of San Andres, Doña Jose Cordova, raised a

family, and fought on the side of Juarez in the War of Independence.

Martin Tritschler y Cordova, his son, and present Archbishop of Yucatan, received his earlier education at the college seminary in the city of Puebla. From there he went to Rome, where he finished his collegiate courses. Returning to Mexico and his native state, with high honors and doctorates in philosophy, canonical law, and theology, he at once entered the theological seminary of Puebla, as instructor, and later the cathedral, at the same place, as a most valuable aid to the bishop.

Pope Leo XIII., who followed the young man's career with kindly interest, made him head of the

see of Yucatan, vacant by the death of the ever-lamented Crescencio Carillo, eminent not only as a theologian, but as a scholar. Pio X., by papal bull dated the 11th of November, 1906, decreed the elevation of the Yucatan diocese to an archbishopric, which decree was carried into effect on the 14th of April, 1907.

The elevation of the bishopric into an archbishopric was then an accomplished fact from the date above mentioned, but a most important rite, the placing of the pallium upon the shoulders of the archbishop, had yet to be performed.

The pallium is a kind of scarf, a species of stole or cape, with two pendula, upon which are seven velvet crosses; it is made from the wool of consecrated sheep, woven in a special way, upon a certain day, by the nuns of a specially designated order, and deposited in a certain unvarying location, there to remain until taken out to perform its destined mission. It is a symbol of Saint Peter, the prince of the Apostles and the Good Shepherd who carried upon his shoulders the weak lamb of the flock. The placing of it upon the shoulders of the archbishop signifies that upon him now falls the privilege and duty that Saint Peter possessed when on earth.

The Cathedral, Merida, Yucatan

In the Centre stands the Most Reverend and Illustrious Archbishop of Yucatan, Don Martin Tritschler y Cordova, with the Bishops of his Diocese, Doctor Don Francisco Regis Campos, Bishop of Tabasco, and Doctor Don Francisco de Paula Mendosa, Bishop of Campeche

New York Tries a New Kind of Street Car

The Rear Platform of the new "Pay-as-you-enter" Car

Alighting from the Front Platform of the new Car

THE "pay-as-you-enter" car has reached New York. Several of these vehicles have been placed in service on the Fourth and Madison Avenue line, and, should these prove satisfactory, this type of car will no doubt gradually supersede the kind now in use over all the chief car lines of the city.

The new car was first introduced into Montreal, and its success there led to its adoption in Chicago and Buffalo, by Mr. T. E. Mitten, head of the street railroad systems in those cities, and subsequently in Newark, New Jersey. In Pittsburgh the system proved a failure, owing to the company's neglect to provide specially constructed cars. In the other cities it has been uniformly successful.

The new cars are eleven feet longer than the standard cars of the Metropolitan system. Their chief feature is the very wide platform, seven feet and a half by six, which is divided into compartments, one for entrance and one for exit. The conductor stands behind a railing on the platform and collects the fares, dropping them into a changing box before the passengers enter the car. Entrance is only to be had by the rear platform, but exit will be permitted at both the front and rear.

It is fully expected that these new cars will pay their way. Under the present system the traction company has missed collecting a good many fares. Moreover, in cases when the conductor is standing at the front end of a crowded car collecting his fares, he is frequently dependent upon the word of passengers on the rear platform for a starting signal. As a result of this system a great many persons have been thrown in the street as they were boarding and alighting from surface cars, and the negligence actions that have followed have been a source of heavy expense to the com-

One of the new Cars with which New York is seeking to simplify its Transit Problem

A Ground Plan of the "Pay-as-you-enter" Car, showing the Arrangement of Entrance and Exit

pany. In the new cars the conductor does not leave the rear platform.

The cars are equipped with air and differential brakes and each is driven by four powerful motors. There are push buttons between every two windows by means of which the car may be stopped. Colored light signals are displayed at night to indicate the direction. Cars with blue lights run between Brooklyn Bridge and Elsie Street; with yellow lights, between 116th Street and Roosevelt Tunnel; with green lights, between 80th Street and Astor Place; while a red light indicates that no passengers will be carried.

Hoop-La! The Circus

By VICTOR ROUSSEAU

"The Woman in White"

The Sisters who pass in the Air

catch that gleaming gleam in the orbit of bald, blood Paternfamilias' Notice his slinking hand, his outstretched eremum, the furtive hitch which he gives to his well-recessed, immaculate trousers? Paternfamilias has the circus fever. He is a lay one more: he watches the attendants stealthily. As soon as their backs are turned he means to sneak in under the tent. Or perhaps they'll let him in for watering the elephant.

"Here they watered the elephant?" asks Paternfamilias.

"Sir," replies the gent in uniform, "we have a water supply laid on for fifty elephants, not to mention Itchy Ah, the prodigious phenomenal pachydermatous pachyderm born at Bridgeport, the smallest elephant now in captivity.

Paternfamilias wakes from his dream, recovers his dignity, and stalks into the arena. He sniffs the sawdust and turns three hand springs into his place. The spectacle starts.

Yes, the circus is here. The seal of Barnum and Bailey has been stamped upon Madison Square Garden. All our old friends are with us again, fresh and personably young. Dear old jokers, your spring clothes cannot conceal you, but we will laugh with you. Look! here come the elephants, thirty-six in number, the dancing

horses, the tapering tapirs, the performing pigs, the daring lady equestriennes and tight-rope dancers, the camels, the monkeys, the—

What is it isn't as it is? What is this void? Where is the asymmetrical association of assorted stativisms? Where is the bearded lady? Where are the last two specimens of the Aztec race, captured by strenuous and superhuman skill upon the plains of Pennsylvania? Where are the freaks of yesterday?

"Where is the bearded lady gone,

The human cushion for point and pin,

The giant, and also the skeleton,

And he who wears the elastic skin?

Nothing is left of all, I ween.

The dwarf and the dog-faced boy do-joe,

And the tattooed girl are the one-lashed,

Where are the freaks of last year's show?"

But if the freaks have gone, they are scarcely missed among the miscellaneous medley of delightfully daring and delectable demonstrations which Barnum and Bailey offer us. You should have seen the Leamy Ladies. They are three. Five thousand nerve-racked, neurotic-necked crickets contemporaneously when they performed their feats on the trapeze. Right up at the very top of the garden one leamy lady knog by a slender limb, while another leamy lady, holding between her teeth one end of a leather attachment whose other end was tethered to the extremity of the aforesaid limb of the leamy lady of the first part, performed

a species of aerial hula dance, while the leamy lady of the third part worked an electrical display of whirling lights by pedalling a bicycle.

And you should have seen the barly bear and the trio of tricky trained mules and reckless riders, and the Imperial Viennese Troupe and Fisher Troupe, who fly from hand to hand like rubber balls upon the high trapeze.

But Wotan, the horse balloonist, must not be ignored. Standing on a small platform under a balloon, Wotan and his plucky rider, Miss Leon Mardor, ascended one hundred feet up to the dome of the arena, and there endure a baptism of fireworks, through which Wotan stands like a statue.

Also commend me to the grand hippodrome races: the lady jockeys and the two and four horse chariot races, and the dog and monkey races. But here's the climax. What do you think of the aerial auto race between the sisters La Roque, two pretty French girls? Down the climes fly the machines, one inch apart: the foremost turns a somersault through the air, while the second shoots deftly beneath it and lands fifty feet away.

Go up, thou bald-head! Go up, thou Killjoy! Go up to the circus, and if Gust Bopalar shall follow thee, send him to the asymmetrical association of assorted stativisms in liches.

The circus is over! A twilight of the gods descends on it. Illusion yields to hard, prosaic reality. Paternfamilias, shivering with the cold fit that succeeds his fever, comes to himself with a start, and glances round him, in some degree alarmed. He is no longer a boy, but an old man. He rises to his feet, stretches his cramped old limbs, and struggles into his overcoat. The benches and boxes, filled five minutes before with the applauding crowds, remain bare, empty witnesses of the tankard arena. The rump and high trapezes which swing so recently beneath the adept, agile acrobats, look an archaic, archaic array of the Fisher Troupe and Imperial Viennese (not to mention the lissome, lithe, leamy ladies), still oscillate ferociously. But where is that galaxy that held us enchanted in reminiscences of boyhood? Where are the clowns, the elephants, the tricky mules, the performing pig? (Where are the leamy ladies?) Where is the sublime, stupendous, and spectacular scenario of Amos, Africans, Abyssinians, and Nababians, all accurately accoutred according to actuality?

The dancing horse droops his head wearily as he plops to his stall. The performing pig runs to his sty squealing in anticipation of potato peelings and cold slop. I see three very weary Leamy ladies going home to bed (or supper); and the sisters La Roque, wondering whether they will have sufficed a sum sufficient for retirement before that constant spectre of death shall claim them. The midget blinks her black eyes sleepily at the youngest lady elephant ever born in captivity, and the youngest lady elephant blinks back at her again. The electric light goes out in the toy monkey house, and the marmoset, who had slept with her face pressed to the hot bulb, shivers and wakes.

"It was a good show this year, Tommy," says Paternfamilias. "But they don't have circuses like they did when I was a boy. The elephants were larger then. And you ought to have seen the clowns! They don't have clowns like they did forty years ago. I remember how I wanted my father to take me to the circus once, and—still, it was a good show, Tommy, wasn't it?"

How the Jarroles support themselves

Music and the Opera

AN "AMERICAN" CONCERT

By LAWRENCE GILMAN

DR. KARL MUCK did an amiable thing when he placed upon the programme of the Boston Symphony Orchestra at its last New York appearance of the season three works by composers living in America. The occasion thus brought about was described in the preliminary announcements as "an American concert." It would be idle to quarrel with the designation on the score of the dubious Americanism of one of the composers represented, though it would be vain to regard the concert as in any important sense a demonstration of musical nationalism. Dr. Muck chose for performance a suite, "Jeanne d'Arc," by Mr. Frederick S. Converse, the "Pagan Poem" of Mr. Charles Martin Loeffler, and the "Indian" suite of MacDowell. Mr. Converse is undoubtedly an American, so, of course, was MacDowell; Mr. Loeffler was born at Mühlhausen, Alsace; he studied composition both in Germany and in France, and now lives in Medford, Massachusetts; he has been a naturalized citizen of the United States for almost a quarter of a century. Mr. Converse in his music displays orientalism; he writes at times like Frensdorff of to-day, at times like a German of the day that followed Wagner. What little there is of external influence in the musical personality of MacDowell suggests Scandinavia and the Germany of Wagner. As for Mr. Loeffler, he is in his music scarcely less French than the French, though there is a richer and stronger fibre in the substance of his thought than there would be if he were merely Gallic.—So again is one baffled in one's search for a unifying Americanism in the interesting exhibit arranged by Dr. Muck. One can fancy that excellent foreigners pondering the questions, "What constitutes an American? And what is American music?" Doubtless Mr. Converse is as American as may be though he is a little difficult to trace any characteristic in his music which invites the exorbitant adjective. Doubtless, too, MacDowell was unimpeachably an American, and he wrote music that is saturated with individual flavor, but there is nothing American in his mysticism, his bardic fervor, his poetic glamour? And coming again to the cosmopolitan Mr. Loeffler, it is possible to call his music American for any reason save that it was written within the bounds of Mr. Roosevelt's empire? So let us, in this matter, emulate the attitude assumed by Dr. Johnson upon a certain occasion. A lady had been discussing with the omniscient Doctor the question of a future state. "She seemed desirous of knowing more," relates the delectable Boswell, "but he left the question in obscurity." So, therefore, may we. It will be more profitable to consider briefly the actual quality of the musical exhibit so regally displayed by Dr. Muck.

Mr. Converse's suite, which he describes as a series of "dramatic scenes," is a concert arrangement of the incidental music which the composer wrote for Mr. Percy Mackaye's play, "Jeanne d'Arc," performed in New York last winter by Miss Marlowe and Mr. Sothorn. It then shared the fate which in this country befalls all serious and ambitious music composed for use in connection with the spoken drama. That is to say, it had to suffer performance by an inadequate orchestra, and those portions of it which were designed to be played while the curtain was down were simply not listened to at all. In other words, Mr. Converse and the managers who commissioned his music were taught by melancholy experience the lesson which has so often been inculcated—that American players are not prepared to listen to, and do not care to hear, incidental music in the theatre. To write and to perform it is a sheer waste of energy, time, and money.

Mr. Converse's "Jeanne d'Arc" music is therefore, in its concert form, virtually a new thing. It is presented in five movements, bearing these titles: (1) "In Deming"; (2) "Pastoral Revue"; (3) "Battle Hymn"; (4) "Night Vision"; (5) "The Maid of God." The music, completed—as to its present form—in 1907, is the latest that Mr. Converse has put forth. It cannot be said

that it reflects credit upon its composer. We have before, and at some length, considered in this place the qualities which make Mr. Converse a conspicuous figure among composers living and writing in America. He has much skill, he has fervor, he has a sense of backgrounds and atmosphere, and he has poetic instinct. In his "Mystic Trumpeter," after Whitman, there are splendid moments, there are freedom and verity, a large and impressive sincerity. But one feels always with him that he is too hospitable to the casual idea, the inferior inspiration. His creative instinct is not fine enough, not scrupulous or suspicious enough. Then it happens that his "Jeanne d'Arc" music, for example, has often the quality which Mr. Meredith had in mind when he characterized certain worthy sentiments as "platitudes under bala." Mr. Converse has obviously been moved and stirred by the noble and exalted implications of his subject; he has put down his meditations concerning them in music which is undoubtedly sincere, but which is grievously far from being eloquent or just. It is not telling in ideas, it is not marked or individual in its physiognomy, and it often verges upon something which, in a less responsible music-maker than Mr. Converse, would be called sheer commonness. One striking virtue it has; it is poetically and ingenuously scored, though it does not betray a particularly original method.

Mr. Loeffler's "Pagan Poem" is in a different case. It was inspired by a portion of the Eighth Eclogue of Virgil, and its burden is the longing of a Thracian girl who, deserted by her lover, seeks by magic rites and incantations to have him back to her. When Mr. Loeffler's music was performed for the first time in Boston, on November 23 of last year, it was reviewed on this page, and a deliberate opinion of it was set down. It will therefore suffice to say now that the impressions recorded four months ago were confirmed by the first New York performance of this extraordinary work. We said then, and we say now, that it is original and imaginative; this tempo has not been surpassed by any piece of orchestral writing that has come out of America. It is music which, because of its push-breaking qualities, its utter freedom and independence of style, will be long in compelling any general recognition of its importance. This is music of to-morrow. Let there be noted here simply a conviction of its great beauty, its superb and victorious artistry, its engrossing eloquence.

Concerning the "Indian" suite of the lamented MacDowell, there is nothing to say that has not been said repeatedly by those who rightly value this noble and deeply affecting score. The suite is now sixteen years old, and it has been known to our concert rooms since 1890; yet its beauty and its ability do not seem less potent and actual with the passage of time; rather does the music seem more deeply impressive, more certain of its potency, with the advancing years. And it will not be inept to remark here that the music is most valuable in those portions of it which are of MacDowell's own invention. The themes of avowedly Indian origin upon which he founded the work give it an unquestionable pungency, a characteristic flavor; but the less adroitly aboriginal the composer is here the more memorable and consequential is the result. The themes which are of his own creation are, paradoxically enough, not only more melodically swelling and potent, but more truly indicative of the essential mood, the fundamental intent, of the work. The fact is significant,—and, it may be ventured, worthy of consideration by those who hold a brief for aesthetic nationalism.

It remains to be said that Dr. Muck, one of the greatest of living conductors of these works, with astounding insight, with unflagging sympathy, with exquisite discrimination and noble authority, with the skill and clairvoyance of a master. The orchestra—an orchestra that for more than a quarter of a century has been an honor to art in America—played as it always plays; incomparably. It is certain that this remarkable body of virtuosos has never in its history played with so harmonious a blend of technical adroitness and expressional variety.—It has never been at once so perfect and so eloquent an instrument.

A Spirit in Prison*

A Novel

By Robert Dickens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER VI

THE Marchesino Panarello was generally very sincere with his friends, and the boyish expression in his eyes was not altogether deceptive, for despite his wide knowledge of certain aspects of life, not wholly admirable, there was really something of the simplicity of a child—in a child that could be very naughty—in his disposition. But if he could be naive he could also be mischievous and even subtle, and he was very swift in grasping a situation, very sharp in reading character, very cunning in the pursuit of his pleasure, very adroit in deception, if he thought that publicity of himself would be likely to lead to the frustration of his purpose.

He had seen at once that Artola either knew, or suspected, who were the occupants of the white boat with the green line; and he had also seen that, influenced, perhaps, by one of those second thoughts which lead men into caution, Artola desired to conceal his knowledge or suspicion. Instantly the Marchesino had, therefore, dropped the subject, and as instinctively he had devised a little plan to clear the matter up.

The Marchesino knew that when Artola had arrived in Naples he had had no friends in the town or neighborhood. But he also knew that recently an Englishwoman, an old friend of the novelist, had come upon the scene, that she was living somewhere not far off, and that Artola had been to visit her once or twice. So Artola had spoken of her very casually, and the Marchesino's interest in her had not been awakened. He was not an inquisitive man by nature, and was always very busy with his own pursuit of pleasure. But he remembered now that once he had seen his friend being moved in the direction of Posillipo, and that in the evening of the same day Artola had mentioned having seen to visit his English friend. This fact had suggested to the Marchesino that if his suspicion were correct, and the ladies in the white boat with the green line were this English friend and a daughter, they probably lived in some villa as easily reached by sea, as by land. Such villas are more numerous toward the point of the Capo di Posillipo than nearer Naples, as the lighthouse, after the Mergellina, mounts the hill and diverges further and farther from the sea. The Antico Giosepone is a small waterside restaurant at the point of the Capo di Posillipo, a little below the Villa Rosebery.

The Marchesino's suggestion of a dinner there that evening had been prompted by the desire to draw his friend into the neighborhood which he suspected to be the neighborhood of his chamber of the sea. Once there, he might either find some pretext for making her acquaintance through Artola—if Artola did know her—or, if that were impossible, he might at least find out where she lived, by the manner of Artola when the Antico Giosepone was mentioned, he knew at once that he was playing his cards well. The occupants of the white boat were known to the novelist. They did live somewhere near the Antico Giosepone. And certainly Artola had no desire to bring about his—the Marchesino's—acquaintance with them.

That this was so neither surprised nor seriously vexed the Marchesino. He knew a good deal of his friend's character, knew that Artola, despite his geniality and friendliness, was often reserved—even with him. During their short intimacy he had certainly told Artola a great deal more about his affairs with women than had been told to him in return. This fact was borne in upon him now. But he did not feel angry. A careless good nature was no essential part of his character. He did not feel angry at his friend's secrecy, but he did feel mischievous. His lively desire to know the girl with "the perfect little nose" was backed up now by another desire—to "teach" the Englishman—that it was better to meet complete frankness with complete frankness.

He had strolled out of his friend's room pleasantly, acting the melancholy youth who had lost all hope of succeeding in his desire; but directly the door was shut his manner changed. Disregarding his lift, he ran lightly down the stairs, made his way swiftly by the revolving door into the street, crossed it, and walked towards the harbor of Santa Lucia, where quantities of pleasure boats lie waiting for hire, and the boatmen are gathered in knots smoking and gossiping, or are strolling singly up and down near the water's edge, keeping a sharp lookout for possible customers. As the Marchesino turned on to the bridge that leads towards Castel dell'Oro, one of these boatmen met him and saluted him.

"Good day, Giuseppe," said the Marchesino, addressing him familiarly with a loud Neapolitan accent.

"Good day, Signorino Marchesino," replied the man. "Do you want a boat? I will take you for—"

The Marchesino drew out his cigarette case.

"I don't want a boat. But perhaps you can tell me something."

"What is it, Signorino Marchesino?" said the man, looking eagerly at the cigarette case, which was now open, and which displayed two tempting rows of fat Egyptian cigarettes reposing side by side.

"Do you know a boat—white with a green line—which sometimes comes into the harbor from the direction of Posillipo? It was here this afternoon or it passed here. I don't know whether it went on to the Asinara."

"White with a green line?" said the man. "That might be—Who was there in it, Signorino Marchesino?"

"Two ladies—one old and one very young. The young lady—"

"Those must be the ladies from the island," interrupted the man. "The English ladies who come in the summer to the Casa del Mare, as they call it, on the island close to the Grotto of Virgilio by San Francesco's Pool. They were here this afternoon, but they're gone back. Their boat is white with a green line, Signorino Marchesino."

"Grazie, Giuseppe," said the Marchesino, with an immovable countenance. "Do you smoke cigarettes?"

"Signorino Marchesino, I do when I have any sold to buy them with."

"Take these."

The Marchesino emptied one side of his cigarette case into the boatman's hand, called a hired carriage, and drove off toward the Villa—towards the house going at a frantic trot, while the carriage, holding a ruin in each hand, ejaculated, "A—ah!" every ten seconds in a voice that was feverishly hortatory.

Artola, from his window, saw the carriage rattle past, and saw his friend leaning back in it, with alert eyes, to scan every woman passing by. He stood on the balcony for a moment till the end of the wheels on the stone pavement died away. When he returned to his writing table the mood for work was gone. He sat down in his chair. He took up his pen. But he found himself thinking of two people, the extraordinary difference between whom was the cause of his now linking them together in his mind. He found himself thinking of the Marchesino and of Vere.

Not for a moment did he doubt the identity of the two women in the white boat. They were Hermione and Vere. The Marchesino had read him rightly, but Artola was not aware of it. His friend had deceived him, as almost any sharp-witted Neapolitan can deceive even clever foreigners. Certainly he did not particularly wish to introduce his friend to Vere. Yet now he was thinking of the two in connection, and not without amusement. What would they be like together? How would Vere's divine innocence receive the subtle seductions of the Marchesino? Artola, in fancy, could see his friend Doro for once completely disarmed by a child. Vere's innocence did not spring from folly, but was backed up by excellent brains. It was that fact which made it so beautiful. The innocence and the brains together might well read Doro a pretty little lesson. And Vere after the lesson—would she be changed? Would she lose by giving even if the gift were a lesson?

Artola had certainly felt that his instinct told him not to do what Doro wanted. He had been moved, he supposed now, by a protective sentiment. Vere was delicious as she was. And Doro—he was delighted as he was. The girl was exchanting in her ignorance. The youth—in Artola the Marchesino seemed almost a boy; indeed, often quite a boy—was admirable in his precocity. He embodied Naples, its gay *feverish*, and yet that was hardly the word—perhaps, rather, one should say his sunny laughlines, its reckless devotion to life purged of thought. And Vere—what did she embody? Not Sicily, though she was in some ways so Sicilian. Not England; certainly not that!

Suddenly Artola was conscious that he knew Doro much better than he knew Vere. He remembered the statement of an Austrian psychologist that men are far more mysterious than women, and shook his head over it now. He felt strongly the mystery that lay hidden deep down in the innocence of Vere, in the innocence of every girl child. Vere's age, who had brains, temperament, and perfect purity. What a marvellous combination they made! He imagined the fiercer flame of their burning in the night of the world of men. Vere must be happy.

When he said this to himself he knew that, perhaps for the first time, he was despairing of something that he ardently desired. He was transferring a wish that was something like a prayer in the heart of one who had seldom prayed. He was giving up hope for Hermione and fostering hope on Vere. For a moment that seemed like treachery, like an abandonment of Hermione. Since their interview on the sea Artola had felt that for

Ireneuse all possibility of real happiness was over. She could not detach her love. It had been fastened irrevocably on Maurice. It was now fastened irrevocably on Maurice's memory. Long ago had she, while he was alive, found out what he had done, but passion for him might have died, and in the course of years she might have been able to love again. But now it was surely too late. She had lived with her memory too long. It was her blessing—to remember, to recall, how love had blessed her life for a time. And if that memory were devastated now she would be as one wrecked in the storm of life. Yet with that memory how she suffered!

What could he do for her? His chivalry must exercise itself. He must remain in the lists, if only to fight for Ireneuse in Vere. And the Marchesino? Artois seemed to divine that he might be an enemy in certain circumstances.

A warmth of sentiment, not very common in Artois, generated within him by such thoughts as these; thoughts that detained him from work still glowed in his heart when evening fell and the Marchesino came gayly in to take him out upon the sea.

"There's a little wind, Emílio," he said, as they got into the boat in the harbor of Santa Lucia; "we can sail to the Antico Giuseppino. And after dinner we'll fish for sardis. Isn't it warm? One could sleep out on such a night."

They had two men with them. When they got beyond the break-water the sail was set, the Marchesino took the helm, and the boat slipped through the smooth sea, rounded the rocks on which the old fort stands to stare at Capri, radiant now as a single isle in the curious ethereal light of evening, and headed for the distant point of land which hid Ischia from their eyes. The freedom of the Bay of Naples was granted them—the freedom of the sea. As they ran out into the open water and Artois saw the round, gray eyes of the Marchesino dancing to the merry music of a complete bodily pleasure, he felt like a man escaping. He looked back at the city and at the dark, sad, desolate bay, and his deep and persistent interest in men, he understood the joy of the hermit who casts them from him and escapes into the wilds. The radiance of the bay, one of the most radiant of all the inlets of the sea, held and glared in the brilliant daytime, becomes exquisitely delicate towards night. Tomorrow, its fiery watcher, looks like a kindly gentleness, until perhaps the darkness shows the flame upon its flanks, the flame bursting forth from the mouth it opens to the sky; and the coast line by Sorrento, the lifted crest of Capri, even the hill of Posillipo, appear romantic and enticing, calling lands holding wonderful pleasures for men, joys in their rocks and trees, joys in their dim recesses, joys and real realities building every dream upon their coasted wash by the whispering waves.

The eyes of the Marchesino were dancing with physical pleasure. Artois wondered how much he felt the beauty of the evening, and how. His friend evidently saw the question in his eyes, for he said:

"The man who knows not Naples knows not pleasure."

"Is that a Neapolitan saying?" asked Artois.

"Yes, and it is true. There is no town like Naples for pleasure. Even your Paris, with all its theatres, its cottages, its restaurants—no, it is not Naples. No wonder the foreigners come here. In Naples they are free. They can do as they will. They know we shall not mind. We are never shocked—"

"And do you think we are easily shocked in Paris?"

"No, but it is not the same. You have not Venus there. You have not the sea, you have not the sun."

Artois began laughingly to protest against the last statement, but the Marchesino would not have it.

"No, no, it shines—I know that—but it is not the sun we have here."

He spoke to the seamen in the Neapolitan dialect. They were brown, muscular fellows. In their eyes were the extraordinary boldness and directness of the sea. Neither of them looked gray. Many of the Neapolitans are much upon the sea have actions, even grave, faces. These were intensely, almost overpoweringly male. They seemed to partake of the essence of the elements of nature, as if blood of the sea ran in their veins, as if they were but with the grim and lazier fires of the sun. When they spoke their faces showed a certain cheerfulness, perhaps from Artois, but never lost the look of force, of an almost true masculinity ready to battle, perpetually alive to hold its own.

The Marchesino was also very masculine, but in a different way and more consciously than they were. He was not cultured, but such civilization as he had endowed him with a power to catch the moods of others not possessed by these men, in whom per seience was more visible than adroitness, unless, indeed, any question of money was to the fore.

"We shall get to the Giuseppino by eight, Emílio," the Marchesino said, dropping his conversation with the men, which had been about the best hour and place for their fishing. "Are you hungry?"

"I shall be," said Artois. "This wind brings an appetite with it. How well you steer!"

The Marchesino nodded eagerly.

As the boat drew ever nearer to the point, running swiftly before the light breeze, its occupants were silent. Artois gazed, watching the evening with the eyes of a lover of nature, but also with the eyes of one who takes notes. The Marchesino seemed to be intent on his occupation of pilot. As to the two sailors, they sat in the accustomed calm and stolid silence of seafaring men, with wide eyes looking out over the element that ministered to their wants. They were certain, perhaps, that from Artois, to whom it gave him an intense aesthetic pleasure, differently from the Marchesino, to whom it was just a path to possible excitement, possible gratification of a new and daring desire. They connected

it with strange superstitions, with gifts, with deprivations, with death. Familiar and mysterious it was surely to them, as to all seamen, like a woman possessed whose soul is far away.

Just as the clocks of Posillipo were striking eight the Marchesino steered the boat in to the quay of the Antico Giuseppino. Although it was early in the season a few deal tables were set out by the water-side, and a swartly waiter, with huge mustaches, and a napkin over his arm, came delicately over the stones to ask their wishes.

"Will you let me order dinner, Emílio?" asked the Marchesino; "I know what they do best here."

Artois agreed, and while the waiter shuffled to carry out the Marchesino's directions the two friends strolled near the edge of the sea.

The breeze had been kindly. Having served them well, it was now dying down to its repose, leaving the evening that was now to night profoundly calm. As Artois walked along the quay he felt the approach of calm like the approach of a potentate, serene in the vast consciousness of power. Power was invading the sea, irresistible peace. The night was at hand. Already Naples unrolled its chain of lamps along the bay. In the gardens of Posillipo the lights of the houses gleamed. Opposite, but very far off across the sea, shone the tiny flames of the houses of Portici, of Torre del Greco, of Torre Annunziata, of Castellammare. Against the gathering darkness Vesuvius belched slowly soft clouds of rose-colored vapor, which went up like a menace into the dim vault of the sky. The sea was without waves. The boats by the quay, where the wind seldom past the Villa Reale to the village of Posillipo, scarcely moved. Near them, in a group, leaning against the wall and talking rapidly, stood the two sailors from Naples with the boatmen of the Giuseppino. Old lamps glimmered upon two or three of the deal tables, round one of which was gathered a party consisting of seven large women, three children, and a very thin middle-aged man with bright eyes, all of whom were eating oysters. Further on, from a small arched that gave access to a fisherman's house, which seemed to be constructed partially in a cave of the rock, and which was gained by a steep and crumbling stairway of stone, a mother called shrilly to some half-naked little boys who were fishing with tiny hand nets in the sea. By the table which was destined to the Marchesino and Artois three ambulant musicians were hovering, holding in their broad and dirty hands two shabby mandolins and a guitar in the distance a rock with a white cap on its head and bare arms was visible, as he moved to and fro in the lighted kitchen of the old restaurant, preparing a "zuppa di pesce" for the gentlemen from Santa Lucia.

"Che bella notte!" said the Marchesino, suddenly.

His voice sounded sentimental. He twisted his mustaches and added:

"Emílio, we ought to have brought two beautiful women with us to-night. What are the moon and the sea to men without beautiful women?"

"And the fishing!" said Artois.

"To the devil with the fishing," replied the young man. "Here! our dinner is ready, with thanks to the Madonna!"

They sat down, one on each side of the small table, with a small lamp between them.

"I have ordered vino bianco," said the Marchesino, who still looked sentimental. "Cameriere, take away the lamp. Put it on the next table. Va bene. We are going to have 'zuppa di pesce', gambers, and real oysters. The wine is Capri. Now then," he added, with sudden violence and the coarsest imaginable Neapolitan accent, "If you follow play 'Santa Lucia,' 'Napoli Bella,' or 'Sole Mio' you'll have my knife in you. I am not an Italian. I am a Neapolitan. Remember that!"

He proved it with a string of gutter words and oaths, at which the musicians smiled with pleasure. Then, turning again to Artois, he continued:

"If one doesn't tell them they think one is an boobie. Emílio, do you not love to see the moon with a beautiful girl?"

His curious assumption that Artois and he were contemporaries because they were friends, and his apparently absolute blindness to the fact that a man of sixty and a man of twenty-four are both men, and that a man of sixty and a man of twenty-four are both men, always severely entertained the novelist, who made it his business with this friend to be accommodating, and who seldom, if ever, showed himself authoritative or revealed any part of his real inner self.

"Ma sì," he replied; "the night and the moon are made for love."

"Everything is made for love," returned the Marchesino. "Take plenty of soaked bread, Emílio. They know how to make this zuppa here. Everything is made for love. Look! There is a boat coming with wine is it?"

At a short distance he saw the shore a rowing boat was visible, and from it now came shrill sounds of very common voices, followed by shouts of male laughter.

"Perhaps they are beautiful," said the Marchesino, at once on the alert.

The boat drew in to the quay, and from it three sprang, with much noise and many pretensions, two overboarded women, probably, indeed, almost certainly, concubines—and two large young men, whose brown fingers and whose chests gleamed with false diamonds. As they passed the table where the two friends were sitting, the Marchesino raked the women with his bold, gray eyes. One of them was large and artificially blond, with an enormous black wig, and a small, dark, curly wig on the other side of her pale dyed hair, on which was perched a bright blue hat. The other was fiercely dark, with masses of coarse, black hair, big

(Continued on page 28.)

Sea Traffic and Transportation

Every craft of five tons register or more that plies on the coast or inland waters of America is registered, analyzed, bottled, and carefully dissected by our paternal government. The figures for the past year show that there are 35,321 such vessels, with an aggregate gross tonnage of 12,893,439, and a value of over five hundred million dollars.

By far the largest part of the American shipping—that is to say, 20,032 vessels, with an aggregate tonnage of more than 4,980,000—operate on the Atlantic coast and Gulf of Mexico. The next greatest number, 9622 vessels with a tonnage of over 4,000,000, ply along the Mississippi River and its tributaries. But so many of these vessels reported from the Mississippi River are coal barges and scows, that in spite of the large number and great tonnage the value is only about \$23,000,000 and the income only about \$17,000,000. The smaller number of vessels on the Great Lakes, 2950, represents a value of over \$100,000,000 and derives an income of \$65,000,000. Shipping on the Pacific coast does business valued at about \$49,000,000.

One striking fact is the rapid increase in the use of iron and steel as materials for the construction of vessels. In 1880, 26.5 per cent. only of the total value of new construction was of iron and steel; in 1890 the proportion was 47.2 per cent.; in 1900, 71.2 per cent.; and in 1905, 81.7 per cent. Or, to state this increase in terms of tonnage: Instead of value, in 1880 the gross tonnage reported for vessels constructed of iron and steel exceeded the gross tonnage reported in 1889 by 2,751,505 tons—an increase of more than 520 per cent. More than half of this increase occurred on the Great Lakes.

During the year 1906 ferriesboats transported 330,737,039 passengers, over sixty-three per cent. of whom were carried by the ferries in and around New York Harbor. Of the total number, 309,752,581 passengers rode on regular ferriesboats and 20,984,558 on unregular ferriesboats. While the income of ferriesboats is derived largely from carrying these passengers, in some cases, particularly on the Mississippi River and its tributaries, the carrying of goods, teams, and even the carriage of freight bring in an amount in excess of the passenger business.

On railroad ferries carrying passenger coaches, it is estimated, 37,453,512 additional persons were carried. These ferries form connecting links in railway systems and transport for short distances whole trains of cars without disturbing the passengers or the freight.

The busiest canal in the world is the St. Marys Falls Canal, connecting Lake Superior with Lake Huron. In 1906 the net tonnage of vessels passing through this was three times as great as that through the Suez Canal, and more than seven times as great as that through the Kaiser Wilhelm, or Kiel, Canal. This is the more noteworthy since the St. Marys Falls Canal, on account of the severity of the cold, is open to traffic for only about eight months in the year, while the others are open throughout the year. The increased use of the St. Marys Falls Canal has been immediately apparent. In 1905, 1,344,379 tons went through; in 1906, 7,546,022 tons; and in 1907, 41,276,962 tons—an amount 3217.3 per cent. greater than in 1890 and 440.3 per cent. greater than in 1889. The amount of freight passing through the canal and connected rivers of the United States in 1906 was 122,000,000 tons, nearly 700 per cent. more than that carried during the year 1885.

The Sway of the Typewriter

The typewriter is playing an important part in civilizing the world. The latest invention in this line is a machine capable of transcribing the Japanese ideogram; but typewriters imitating Arabic, Syriac, Armenian, Hebrew, and other Oriental languages have long been used.

It is funny the arising of anything from a slender letter to a book, can only be done under a permit from the government. Therefore, typewriters which imprint Turkish or Arabic characters are prohibited from pro-

ing through the custom-house. Nevertheless, the increasing demand has somehow produced a small supply. Baghdad, a city of 200,000 inhabitants, has twenty machines, all of which write Arabic. In Syria, one of the most polyglot countries in the world, Syriac, Arabic and French writing typewriters are used by many of the business houses. So, in writing the Arabic script, is learning to adapt the typewriter. To go further east, a number of Hindustani writing machines are now used in Bombay and other cities of India. Chinese seem to be the only language which still resists the typewriter's encroachments.

The Artful Dodger

Ben had been going to school all of a month, and Ben's father thought it high time to find out how things were running. So he asked him one day, "Just what was it you learned all about this morning?"

"Oh, a mouse. Teacher told us all about mouses."

"Fine, sonny. Now how do you spell mouse?"

"A long moment's silence, and then the future editor blue-pencilled the earlier communication thus: "Father, I guess I was wrong. It wasn't a mouse. It was a rat."

New Laws for New Crimes

If Drusus and Solon, the old-time lawmakers, should revisit the earth, a tour of investigation in these United States would make it speedily clear in them that we moderns, as well as the ancients, busy ourselves pretty much all the time with the framing of new laws.

"I am grieved for failure to provide good drinking water on my passenger trains," a Rhode-Islander might say: to which a fellow railroader in South Carolina would add: "In this State a jail sentence follows a neglect to provide spittoons for every two seats in our cars."

A man in Virginia says: "I killed a partridge on the second day of February, for which I must serve time in jail."

In Tennessee a man must pay a fine or serve three years' imprisonment for killing fish with dynamite.

In Wisconsin a baker must serve three weeks in jail for sleeping in his bakery.

In California nurses are punished by fine or imprisonment should they fail, in the proper instance, to notify the physician of certain phases of illness in their patients.

To enter a bicycle path in the State of Ohio is an offense punishable by heavy fine and sometimes imprisonment.

In most of the States it is a penal offense to tap a telegraph wire or to sell someone that is not up to the fire test.

If the old lawmakers were to extend their tour of investigation they might learn of men faced or imprisoned for dropping advertising matter in letter slots; for nagging by means of old machines; and for countless other offenses the very means for committing which were unknown one hundred years ago.

The Story of Beer

Some time ago our German friends celebrated the millenary of the sassage. The birth of beer, however, occurred far back before the dawn of history. It was brewed by the Iberian aborigines of Spain; and it is brewed to-day by tribes in darkest Africa. The history of beer is that of the human race. But there is beer and beer. Our modern beer, which represents the ingenuity of countless beer-makers, is barely five hundred years of age. Gambrinus was the legendary discoverer of beer in tin better sense. Who was Gambrinus? Some say the name is a corruption of Jan Brinon, Duke of Brabant, who did not disdain to be portrayed holding a tankard. Others believe the name to be that of some mythical, beneficent saint

who gave the amber nectar to mortals. Whoever he was, Gambrinus stands today throned in the hearts of millions.

"Hops, Broomfield, bays and beer
Come into England in one year."

says an old distich. It was the application of the hop which first lent glory to beer. Andrew Broomfield, writer of the distich, draws the first distinction between beer and ale. Ale, he says, is brewed from malt and water alone. Add hops, and ale becomes beer.

Beer is more than a beverage—it is a civilization. There are two races, and only two, which rule the world to-day—the wine-oil race and the butter-beer. The line of demarcation is clear and clean; it runs along the northern boundary of the wine lands. The Russians, Germans, Scandinavians, Belgians, English, and people of northern France belong to the butter-beer race; the peoples of the Mediterranean littoral to the wine oil.

All drinking terms run through all languages with little disguise; thus "wine" comes to us unaltered unchanged through Latin, Greek and Hebrew. "Need" has a similar history. "Whiskey" goes back to the Celtic "uisquebaugh," because the Celts invented the science of distillation, or at least first adopted it from the Arabians. "Bism," the Egyptian barley beer, has analogies in every dialect of Europe and western Asia. It survives among the English-speaking peoples in a short, homely, forcible word descriptive of excess.

DESERVING OF SUCCESS.

The marvelous growth of BROWN'S COMPOUND MILK CREAM is due to extensive use in churches and military institutions for the maintenance of their health. It is used by the British Navy and the United States Navy. It is used by the British Army and the United States Army. It is used by the British Navy and the United States Navy. It is used by the British Army and the United States Army.

ADVERTISEMENTS.

THEY GROW

Good-Humor and Cheerfulness from
Right Food.

Cheerfulness is like sunlight. It dispels the clouds from the mind as sunlight drives away the shadows of night.

The good-humored man can pick up and carry off a load that the man with a growl wouldn't attempt to lift.

Anything that interferes with good health is apt to keep cheerfulness and good-humor in the background. A Washington lady found that letting coffee alone made things bright for her. She writes:

"Four years ago I was practically given up by my doctor, and was not expected to live long. My nervous system was in a bad condition."

"But I was young and did not want to die, so I began to look about for the cause of my chronic trouble. I used to have nervous spells which would exhaust me, and after each spell it would take me days before I could sit up in a chair."

"I became convinced my trouble was caused by coffee. I decided to stop it, and bought some Postum."

"The first cup, which I made according to directions, had a soothing effect on my nerves, and I liked the taste. For a time I nearly lived on Postum, and ate little food besides. I am today a healthy woman."

"My family and relatives wonder if I am the same person I was four years ago, when I could do no work on account of nervousness. Now I am doing my own housework, take care of two babies—ten, twenty, the other two months old. I am so busy that I hardly get time to write a letter, yet I do it all with the cheerfulness and good-humor that comes from enjoying good health."

"I tell my friends it is to Postum I owe my life to-day."

Name given by Postum Co., Battle Creek, Mich. Read "The Road to Wellville," in pages. "There's a Reason."

A SPIRIT IN PRISON

(Continued from page 28.)

blatant eyes that looked quite black in the dim lamplight, and a figure that suggested a self-conscious snake. Both were young. They returned the Marchesino's stare with vigorous impudence as they sat by.

"What enigmatic creature!" he murmured. "They are two angels. I believe I have seen one of them at the Margherita. What was her name—Maria Leonì, I fancy."

He looked enviously at the young men. The arrival of the lobster distracted his attention for the moment; but it was obvious that the appearance of these women had increased the feeling of sentimentality already generated in him by the softness and stillness of the night.

The three musicians, rendered greedily rather than inspired by the presence of more rivals, now began to pluck a lively street tune from their instruments; and the waiter, whose mistakes seemed, if possible, bigger, now that night was fully come, poured the white wine into the glasses with the air of one making a blunder.

As the Marchesino ate, he frequently looked towards the party at the neighboring table. He was evidently filled with envy of the two men whose jewels glittered as they preoccupied with their big brown hands. But presently their pleasure and success recalled to him something which he had momentarily forgotten, the reason why he had planned this expedition. He was in pursuit. The recollection cheered him up, restored to him the strength of his manhood, put him right with himself. The envy and the almost sickly sentimentality vanished from him, and he broke into the usual gay conversation which seldom failed him, either by day or night.

It was past nine before they had finished their coffee. The two boatmen had been regaled and had drunk a bottle of wine, and the moon was rising and making the oil lamps of the Giuseppino look pitiful. From the table where the *cavalcade* were established came a series of laughter, which obviously upset the seven large and respectable women who had been eating oysters, and who now sat staring heavily at the gay revellers, while the two thin, middle-aged men with bright eyes began to look furtively cheerful, and even rather younger than they were. The Marchesino passed round a small leaden tray for sold, and the waiter brought the Marchesino the bill and looked inquiringly at Artois, aware that he at least was not a Neapolitan. Artois gave him something and satisfied the Marchesino, while the Marchesino disputed the bill, not because he minded paying, but merely to prove that he was a Neapolitan and not an imbecile. The waiter was settled at last, and they went towards the boat; the Marchesino casting many backward glances towards the two angels, who, with their lovers, were becoming riotous in their gaiety as the moon came up.

"Are we going out into the bay?" said Artois, as they stepped into the boat and were pushed off.

"Where is the best fishing ground?" asked the Marchesino of the elder of the two men.

"Towards the inlet, Signorino Marchesino," he replied at once, looking his interlocutor full in the face with steady eyes, but remaining perfectly grave.

Artois glanced at the man sharply. For the first time it occurred to him that possibly his friend had arranged this expedition with a purpose other than that which he had put forward. It was not the fisherman's voice which had made Artois wonder, but the voice of the Marchesino.

"There are generally plenty of sardine round the inlet," continued the fisherman, "but if the signal would not be too tired it would be best to stay out the night. We shall get many more fish toward morning, and we can run the boat into the Pool of San Francesco and have some sleep there if the signal like. We others generally take a nap there and go to work further on in the night. But, of course, it is as the signal prefer."

"They want to keep us out all night to get more pay," said the Marchesino to Artois in bad French.

He had divined the suspicion that had suddenly risen up in his friend, and was resolved to lay it to rest without, however, abandoning his purpose, which had become much more ardent with the coming of the night. The voices of the laughing women were ringing in his ears. He felt adventurous. The youth in him was rising, and he was longing to be gay, as the men with those women were being gay.

"What do you think, Emilio care?" he asked.

Then before Artois could reply he said:

"After all, what do a few scudi matter? Who could sleep in a room on such a night. It might be August, when one bathes at midnight and sings canzoni till dawn. Let us do as he says. Let us rest in the—what is the Pool?" he asked of the fisherman, pretending not to know the name.

"The Pool of San Francesco, Signorino Marchesino."

"Pool of San Francesco. I remember now. That is the place where all the fishermen along the coast towards Nisida go to sleep. I have slept there many times when I was a boy, and so has Vitorio. To-night shall we do as the fishermen, Emilio?"

There was no pressure in his earnest voice. His eyes for the moment looked as simple, though as eager, as a child's.

"Anything you like, mon ami," said Artois.

He did not want to go to San Francesco's Pool with the Marchesino, but he did not wish to seem reluctant to go. And he said to himself now that his interior hesitation was absurd. Night had fallen. By the time they reached the Pool the inmates of the Casa del Mare would probably be asleep. Even if they were not, what did it matter? The boat would lie among the vessels of the fishermen. The Marchesino and he would share the fish-

men's repose. And even if Hermione and Vere should chance to be out of doors they would not see him, or, if they did, would not recognize him in the night.

His slight uneasiness, prompted by a vague idea that the Marchesino was secretly mischievous, had possibly some plan in his mind connected with the inlet, was surely without foundation.

He told himself so, not once, as the fishermen laid hold of their oars and set the boat's bow towards the point of land which conceals the small harbor of the Villa Rosbery.

The shrill voices of the two singers died away from their ears, but lingered in the memory of the Marchesino, as the silence of the sea took the boat to itself, the sea silence and the angle of the moon.

He turned his face towards the silver, beyond which, hidden as yet, was the inlet where doubt the child he meant to know.

CHAPTER VII

ALTHOUGH Hermione had told Artois that she could not find complete rest and happiness in her child, that she could not live again in Vere fully and intensely as she had lived once, as she still had it in her surely to live, she and Vere were in a singularly close relationship. They had never yet been separated for more than a few days. Vere had not been to school, and much of her education had been undertaken by her mother, at Florence she had been to classes and lectures. She had had lessons in languages, French, German, and Italian, in music and drawing. But Hermione had been her only permanent teacher, and until her sister's death she had never been enthusiastic about anything without carrying her enthusiasm to her mother, for sympathy, explanation, or encouragement.

Nor was not quenched the *clém* of Hermione's nature. What she had told Artois had been true—she was not a finished woman, nor would she ever be, so long as she was alive and conscious. From childhood she had, her passionate, the power of her incapacity to sink herself in any one since her husband's death, her persistent, though concealed, worship of his memory, all these things proved her vitality. Artois was right when he said that she was a force. There was something in her that was red hot, although she was now a middle-aged woman. She needed much more than most people, because she had much more than most people have to give.

Her failure to express herself in an art had been a tragedy. From this tragedy she turned, out with bitterness, but perhaps with an almost deeper energy, to Vere. Her intellect, released from fruitless toil, was running loose demanding some employment. She sought that employment in developing the powers of her child. Vere was not specially studious. Such an out-of-door temperament as hers could never belong to a bookworm, or a reclus. But she was naturally eager, as her father had not been, and she was enthusiastic not only in pleasure, but in work. Long after her mother, trying with loving anxiety to educate her boy's husband, to make him understand certain subtleties of her own, had found herself frustrated. When she made such attempts with Vere she was met half way. The girl understood with sympathy. Her father's mind had slipped away, ever so gradually, from his grasp, but Vere's could grasp even the most elusive subject. There was mental grit in her—Artois knew it. In all her work until her sixteenth year Vere had consulted her mother. Nothing of her child till then was ever hidden from Hermione, except those things which the human being cannot reveal, and sometimes scarcely knows of. The child drew very much from her mother, responded to her enthusiasm, yet preserved indelibly, and quite without self-consciousness, her own individuality.

Artois had noticed this, and this had led him to say that Vere also was a force.

But when she was sixteen Vere woke up to something. Until now no one but herself knew to what. Sometimes she shut herself up alone in her room for long periods. When she came out she looked larger, her mother thought, and she liked to go then to some nook of the rocks and sit alone, or to push a boat out into the centre of the Stat's Pool, and lie in it with her hands clasped behind her head looking up at the passing clouds or at the redness of the hills.

Hermione knew how fond Vere was of reading, and supposed that this love was increasing as the child grew older. She sometimes felt a little lonely, but she was unselfish. Vere's freedom was quite innocent. She, the mother, would not seek to interfere with it. Soon after dinner on the evening of the Marchesino's expedition with Artois, Vere had got up from the sofa, on which she had been sitting with a book of Rossetti's poems in her hand, had gone over to one of the windows, and had stood for two or three minutes looking out over the sea. Then she had turned round, come up to her mother and kissed her tenderly, more tenderly, Hermione thought, even than usual.

"Good night, Madam now," she had said.

And then, without another word, she had gone swiftly out of the room.

After Vere had gone the room seemed very silent. In the evening, if they stayed in the house, they usually sat in Hermione's room upstairs. They had been sitting there to-night. The shutters were not closed. The window that faced the sea towards Capri was open. A little moonlight began to mingle softly with the light from the two lamps, to make it whiter, clearer, suggestive of outdoor things and large spaces. Hermione had been reading when Vere was reading. She did not read now Vere was gone.

(Continued on page 30.)

Moving State Lines

Two projects for changing the boundaries of States have in recent years attracted attention. One of these is to transfer a part of western Florida, extending for one hundred and fifty miles on the seacoast, to the state of Alabama, and the other is to annex the northern neck of Idaho to the State of Washington.

The chief argument in favor of the change in each case is that it would place the region in question in the State with which it is most closely allied in interests. Most of the business of Pensacola, the leading city of west Florida, is with Alabama, and if it were a part of that State its importance as an export point for Alabama products would undoubtedly be heightened. It is also considerably nearer to Montgomery than to Tallahassee, and nearer Birmingham than Jacksonville. The "panhandle" of Idaho has very direct railway connections with Boise and Pocatello.

Proposals for rectifying boundaries as well as for dividing States have been many, the changes actually made, few. Where historical associations gather around a divisional line they are not easily effaced, whatever may be the commercial considerations working in that direction. In cases where military considerations have made the business relations of a region closer with another State than with its own, the remedy is found in the construction of new lines. Political geography enters somewhat into railway building.

If a map of the United States, with all its cities and geographical features but with no suggestion of State lines, were spread out before the wisest of men, and he were asked to divide it into fifty convenient units, how different would be the result of his work from the map of the States as they are.

Where He Was

CALLER: "Is the professor of applied physics in?"

BOSTON BELLER: "No, sir. He is at present occupying the chair of applied lathe."

Shortage of Gum-tragacanth

Hiemtragacanth, a useful vegetable substance which is applied to such diverse uses as the manufacture of lozenges, stiffening fabrics, and marbling books, is being supplied in constantly diminishing amounts. The best variety is that exported from Smyrna, in Asia Minor. It is not grown, however, in the immediate vicinity of Smyrna, but comes from the interior, where the plant from which it exudes grows wild. This kind of gum consists of white, yellow, and red hardened substances, which have become separated after coming out of the bark, and are in the hot sun of a Levantine summer. The gum is secured by an incision in the bark, which is made in the spring and summer of each year, and the gum is usually scraped in September, when the first rains begin to fall.

During the last twenty years, the gum-tragacanth trade of Smyrna has decreased. It has been estimated that the trade has fallen from 600,000 pounds to 35,000 pounds during that length of time. One of the main reasons for this decline advanced is that the trade needs a large amount of capital, mutely speaking, to keep it going. Nowadays this product is shipped from the interior of the country to Smyrna in an unimproved condition. It is there one often sees seven different qualities in order to meet the demands of foreign markets, especially those in England, Germany, and France, where only certain grades are purchased.

Should the Smyrna merchant be unable to place all he has on hand in one season, he usually finds considerable difficulty in disposing of it at all. On the whole, the trade seems to be passing more and more to Constantinople. The value of the exports of Smyrna tragacanth to the United States during 1907 amounted to only \$15,625.

LIQUEUR
Peres Charreux

—GREEN AND YELLOW—

This famous cordial, now made at Tarragona, Spain, was for centuries distilled by the Carthusian Monks (Peres Charreux) at the Monastery of La Grande Chartreuse, France, and known throughout the world as Chartreuse. The above cut represents the bottle and label employed in the pasting-up of the article since the Monks' expulsion from France, and it is now known as Liqueur Peres Charreux (the Monks, however, still retain the right to use the old bottle, and label as well) distilled by the same order of Monks, who have secretly guarded the secret of its manufacture for hundreds of years, taking it with them at the time they left the Monastery of La Grande Chartreuse, and who, therefore, alone possess a knowledge of the elements of this delicious nectar. No Liqueur associated with the name of the Carthusian Monks (Peres Charreux) and made since their expulsion from France is genuine except that made by them at Tarragona, Spain.

Is sold clear West Coast States, Canada, Hawaii, Cuba, Japan & Ceylon, at Branches, New York, N. Y., and Agents for United States.

Not a "Poor Exhibition of Gunnery"

This armored cruiser Maryland of the Pacific fleet stands a good chance of winning this year's target trophy for battleships and armored cruisers, as shown by reports received by the Navy Department of the recent target practice held in Magdalena Bay.

The final merit score of the Maryland was 78.89, placing her first of the armored cruisers of the Pacific fleet. The Rhinoceros won the trophy for the big ships last year with a final merit of 75.42.

Attention is given aboard ship to the shooting of the secondary battery as well as to the shooting of the big guns. The secondary batteries on most of the ships are manned by marines. The gun division, whether of the big guns or the small, which does not help out the score of the ship is very much in disfavor.

The marine guard of the Maryland this year particularly distinguished itself in practice with her secondary battery guns. The battery at twelve 3-pounders finished with an average of 9.81 hits per gun per minute. The highest previous navy record with such guns was 9.31 hits per gun per minute, and the highest in the class last year was 7.60 hits per gun per minute. The highest single 3-pounder gun up to this time was 12.85 hits per minute. These 3-pounders of the Maryland beat this—one making 15.42 hits per minute, a second 15.42 hits per minute, and a third 14.89 hits per minute. The highest percentage of hits previously attained with 3-pounders was 82 per cent. The 3-pounders of the Maryland this year made 73.75 per cent. No single 3-pounder ever before made 100 per cent, of hits. Two of the Maryland have just made 100 per cent, of hits.

Among the marines of the Maryland, of twenty-eight gun-pouncers (twenty-four at 3-pounders and four at 3-inch guns) twenty-two qualified as first class, three as second class, and three did not qualify.

Two of the Maryland's 3-inch guns, manned by marines, scored considerably on the total score of the ship. The ship's score for eighteen 3-inch guns was 11.93 hits per gun per minute, and the two marine guns averaged 12.99 per gun per minute. The highest previous 3-inch record for two or more guns was 11.50 hits per gun per minute.

The 3-pounder scores of the six armored cruisers of the Pacific fleet this year at Magdalena Bay were: Washington, 7.96 hits per gun per minute; and Tennessee, 6.90, the firing of these two vessels being with telescopic sights in the daytime; the Colorado, using open sights, fired in the daytime, 5.03; West Virginia, 3.83; Pennsylvania, 2.40; and the Maryland, 0.61; the latter three vessels firing at night and using open sights.

It is the rule this year that the secondary batteries of naval vessels be fired at night during target practice, for the reason that such batteries are designed primarily to repel attacks of torpedo boats, which, of course, would naturally take place under cover of darkness.

The Fixtures

A New York commercial traveller says that before all Georgia "over dry" he was one day in a saloon in that State when a man entered, nodded to the owner of the place, who was also the bartender, seated himself, and meditated.

Presently he addressed the owner of the saloon.

"Beckin' yer waster sell out, Bill?"

For some ten minutes Bill continued his occupation of filling pint flasks from a jug. Then he looked up.

"Most," he admitted.

"How much—say?" the other inquired. Bill filled another dozen flasks.

"How much you give for the whole shebang—bullshit, stock, good will, an' all?" he inquired, cautiously.

"What about the fixtures?" Bill asked.

"Oh, that go along with the rest of the outfit," Bill assured him; "between cobblers, tin plates, nine ankers, an' a right smart sprinklin' of hom doctors."

Evans'
ALE

AN ale bottled by a dozen different bottlers will have a dozen different tastes. EVANS' ALE is bottled by its makers, hence always the same all over the world.

Harper's Weekly, 1910, by the permission of the publisher, H. B. EVANS & SONS, N. Y.

(Continued from page 28.)

Laying down her book, she sat listening to the silence, realizing the world without. Almost at her feet was the sea, before her a wide-stretching expanse, behind her, confronted by the desolate rocks, the hollow and mysterious caverns. In the night, the Saint, unweary, watched his Pool. Not very far off, yet delightfully remote, lay Naples with its furious activities, its gaudies, its intensities of sin, of misery, of pleasure. In the glare, tourists from the hotels and from the ships were wandering rather vaguely, watched and followed by newspaper sellers, by boats, by greedy palm-faced boys, and old, worn-out men, all hungry for money and indifferent how it was gained. Along the Marina, with its huge serpent of lights, the street singers and players were making their nightly pilgrimage, pausing, wherever they saw a lighted window or a dark figure on a balcony, to play and sing the tunes of which they were weary long ago. On the wall, high above the sea, were dotted the dilapidated fishermen with their long rods and lines. And below, before each stone staircase that descended to the water, was a waiting boat, and in the moonlight rose up the loud cry of "Barra! Barra!" to attract the attention of any casual passer-by.

And here, on this more truly seclusive sea, distant from the great crowd and from the thronging houses, the real fishermen, who live by the sea, were alert and at work, or were plunged in the quiet sleep that is a preparation for long hours of nocturnal work-tolerance.

Hermione thought of it all, was aware of it, felt it, as she sat there opposite to the open window. Then she looked over to her writing-table, on which stood a large photograph of her dead husband, then to the sofa where Vere had been. She saw the volume of Rossetti lying beside the cushion that still showed a shallow dent where the child's head had been resting.

And then she shut her eyes, and asked her imagination to take her away for a moment, over the sea to Messina, and along the curving shore, and up by winding paths to a mountain, and into a little room in a tiny, wretched house, not the house of the sea, but of the priest. It will stand there, and the terrace was still before it. And the olive trees rustled, perhaps, just now in the wind beneath the stars.

Yes, she was there. Lucciana and Gaspare were in bed. But she and Maurice were sitting in the straw chairs on each side of the table, facing the open French window and the night of shallow steps that led down to the terrace. They were looking down the sea, but she heard the whisper of the sea about the inlet, but she would not let it hinder her imagination; she translated it by means of her imagination into the whisper of the wind low down there, in the ravine among the trees. And that act made her think of the ravine, seemed presently to set her in the ravine. She was there in the night with Gaspare. They were hurrying down towards the sea. He was behind her, and she could hear his foot-steps—longing to go faster, but she was breathless, her heart was beating, there was terror on her soul. What was that? A rattle of stones in the darkness, and then an old voice muttering, "Benedicite!"

She opened her eyes and moved suddenly, like one intolerably stirred. What a foe the imagination can be—what a foe! She got up and went to the window. She must drive away that memory of the ravine, of all that followed after. Often she lingered with it, but to-night, somehow, she could not, she dared not. She was less brave than usual to-night.

She looked out of the window.

"Am I a fool!"

That was what she was saying to herself. And she was comparing herself now with other people, older women. Did she know one who could not uproot an old memory, who could suffer, and desire, and internally weep, after more than sixteen years?

"I suppose it is preposterous."

She deliberately chose that ugly word to describe her own condition of soul. But instantly it seemed to her as if far down in that soul something rose up and answered:

"No, it is not. It is beautiful. It is divine. It is more—it is *deus*. He gave you the greatest gift. He gave you what the whole world is always seeking, even in blindness, even in ignorance, even in terrible vice. He gave you love. How should you forget him?"

Far away on the sea that was faintly silvery by the moon there was a black speck. It was, or seemed from this distance to be, motionless. Hermione's eyes were attracted to it, and again her imagination carried her to Sicily. She stood on the shore by the inlet, she saw the boat coming in from the open sea. Then it stopped midway—like that boat.

She heard Gaspare furiously weeping.

But the boat moved, and the sound that was in her imagination died away, and she said to herself, "all that was long ago."

The boat out there was no doubt occupied by Neapolitan fishermen, and she was here on the inlet in the Sea of Naples, and Sicily was far away across the moonlit waters. As to Gaspare—he was sure he was not weeping, faithful though he was to the memory of the dead patron.

And Vere? Hermione wondered what Vere was doing. She felt sure, though she did not know why, that Vere had not gone to bed. She realized to-night that her child was growing up rapidly, was passing from the stage of childhood to the stage of girlhood, was on the threshold of all the mysterious experiences that lie holds for those who have ardent temperaments and eager interests and passionate desires and barless hearts.

To-night Hermione felt very strongly the difference between the father and the daughter. There was a gravity in Vere, a firmness, that Maurice had lacked. Full of life and warmth as she was, she was not the pure spirit of joy that he had been in those first days in Sicily. She was not irresponsible. She was more keenly aware

of others, of just how they were feeling, of just how they were thinking, than Maurice had been.

Vere was very individual.

With that thought there came to Hermione a deeper sense of loneliness. She was conscious now in this moment, as she had never been conscious before, of the independence of her child's character. The knowledge of this independence seemed to come upon her suddenly—she could not tell why; and she saw Vere apart from her, detached, like a column in a lonely place.

And she herself—was not she also like a column in a lonely place? She turned back into the past, and saw again the rushes on the sofa with the shallow dent where the head of Vere had rested, and she saw Maurice's hand, moved by a sudden impulse, she went over to the sofa, sank down on it, and pressed her head against the cushion just where her child's head had been. She shut her eyes and strove to think herself into Vere, and to call Vere's mind into hers. She was driven by the tragic desire of woman—especially tragic in her case because frustrated—to be one with another individually, to merge herself, to be fused, to be no longer as a lonely column set in a desert place.

Vere must not escape from her. She must accompany her child step by step. She must not be left alone. She had told Maurice that she could not live again in Vere. And that was true. Vere was not enough. But Vere was very much. Without Vere what would her life be?

A wave of melancholy thrived over her to-night, a tide came from she knew not where. Making an effort to stem it, she recalled her happiness with Maurice after that day of the Taras fella. How groundless had really been her melancholy then! She had imagined him escaping from her, but he had remained with her, and she loved him, and had loved him, and still the tender and faithful. If he had ever had a rival, that rival had been Sicily. Always her imagination was her torturer.

Her failure in that had been a tragedy because of this. If she could have set her imagination free in an act she would have been far safer than she was. Emile Arcois was really braver than she, for he had a child. But his art surely saved him severely from her sense of desolation. And then he was a man, and men must need far less than women do. Hermione felt that it was so. She thought of Emile in his most helpless moment, in that period when he was ill in Kairoos before she came. Even then she believed that he could not have felt quite so much alone as she did now, for men have long to be taken care of as women do. And yet she was well, in this tranquil house which was her own—with Vere, her child, and Gaspare, her devoted servant.

As mentally she recounted her benefits, the strength there was in her arose, protesting. She called herself harsh names: egotist, egotist, fantasist. But it was no use to attack herself. In the depths of her poor, passive, passionate, hungry woman's nature something wept, and needed, and could not be comforted, and could not be schooled. It complained at our feeble, but really it must be strong; for it was pitifully persistent in its grieving. It had a strange endurance. Like the passing of the years, could not change it could not still it. Those eternal longings of which Hermione had spoken to Arcois—these must have their meaning. Somewhere, surely, there are the happy hunting grounds, dreamed of by the red man—there are the Elysian Fields where the souls that have longed and suffered will find the ultimate peace.

There came a tap at the door.

Hermione started up from the cushion against which she had pressed her head, and opened her eyes, instinctively laying her hand on Vere's volume of Rossetti, and pretending to read it.

"Avanti!" she said.

The door opened and Gaspare appeared. Hermione felt an immediate sensation of comfort.

"Gaspare," she said, "what is it? I thought you were in bed!"

"Ha, ha, ha, ha," he said.

It was a most familiar phrase to Hermione. It had been often on Gaspare's lips when he was a boy in Sicily, and he had always loved it, feeling as if it sprang from a nature pleasantly ready to do anything in her service. But to-night it had an almost startling appropriateness, leaving in her its direct response to her gnawing hunger of the heart. As she looked at Gaspare, standing by the door in his dark blue clothes, with an earnest expression on his strong, handsome face, she felt as if he must have come just then because he was conscious that she had so much need of help and consolation. And she could not answer "no" to his simple question.

"Come in, Gaspare," she said, "and shut the door. I'm all alone. I should like to have a little talk with you."

He obeyed her, shut the door gently, and came up to her with the comfortable confidence of one safe in his welcome, desired not merely as a servant, but as a friend by his patron.

"Did you want to say anything particular, Gaspare?" Hermione asked him. "Hurry—take a cigarette."

She gave him one. He took it gently, twirling his nose as he did so. This was a little trick he had when he was pleased.

"You can smoke it here, if you like."

He lit it gravely and took a whiff. Then he said:

"The signorina is outside."

Hermione looked towards the window.

"It is a lovely night."

"—si, signorina," he said, and then he turned his head and there, looking about the room, Hermione began to wonder what he had to say to her.

THE WORLD CONTRACT STATUTORY INTERNATIONAL LAW A NECESSARY PRECEDENT TO INTERNATIONAL COURTS OF ARBITRATION

By ROBERT J. THOMPSON
American Consul, Hanover, Germany

In simple thought and simple action lies the solution of all great problems of civilization.

Unfortunately for the betterment of mankind, the trained and highly educated mind seems compelled, through force of habit, to apply the complex, the involved and indirect method of reasoning in all questions of magnitude and universal interest. And thus, enterprises at great effort he seeks, awaiting the magic touch of the pen of simplicity to spring into being and reality.

In the question of promoting international peace, or rather establishing a permanent and competent court for the prevention of war between nations, the merit of the proposal seems so apparent that the wonder of the world is that it is not already a reality.

But to establish a competent court we must first create in a proper and formal manner our laws—the only possible foundation upon which such a court can exist.

The rendition of the universally accepted precepts and rules of international law into statutory form, and their formal and official acceptance by the sovereign lawmaking branches of the several governments of the world, is the bridge which will lead us to a point where an international court of arbitration and adjudication would automatically create itself.

A court interprets the law and determines the facts in a given case. But the law must be higher than the court. The court cannot make the law. It must itself be a creature of the law, and therefore, in seeking and hoping to establish an international court of arbitration under the present circumstances, we are simply building a house in the clouds. The substructure of an international constitution or codification of the law of nations is

as essential to such an international court as are the ordinances of a municipal council to a police court or the statutes of a State to its department of justice.

Not is any nation likely to object to or withhold its cooperation to any dignified and serious proposal that will lead to a codification and final sovereign acceptance in statutory form of the great principles of international law. No government can enter the family of civilized nations of the world without an acquiescence in the principles of international law. These laws, for centuries morally accepted by all civilized nations of the world, need but to be put into definite written form, accepted and signed in such form by the lawmaking branches of the great powers of the earth, and we will have brought the nations of the world under prescribed and fixed rules of action in their relations to one another.

This would mean essentially an international constitution.

The righteousness and justice of a war which might follow the decision of a court having been formed under such a constitution would be determined in advance by the judgment of such court, and this great weapon, stronger today than fleets and armies, would not rest upon the individual interpretation of rights or wrongs arrived at by the contending parties, as is now the practice in questions arising between nations.

Let the parties take hold of the handle of this proposition rather than waste time in sterile struggles with a vast body that offers no other purchase than the very evident one of statutory international law.

What nation will be the first to propose the creation of a joint high commission of the greatest living authorities on the law of nations for the rendition or reduction of international law into a world contract—a written statutory instrument?

First your law, gentlemen, then your courts.

"When the defendant told you to go to the devil, what did you then do?"
"I went to see my lawyer."

HYPNOTIC THERAPEUTICS

By John D. Quackenbos, A.M., M.D.

Member of the London Society for Psychical Research; Fellow of the New York Academy of Medicine; Member of the New York Academy of Sciences

As a narrative and a record of humanity most startling psychopathic cases, ranging from this book will impress and amaze all sorts of the mere pain of abnormal bashfulness to the careful. It is a complete and readers. It is a complete and careful exposition of the hypnotic theory of treatment. Many of the cases have stirred public attention in the newspapers. Here they are treated scientifically and in language to hold the interest of every reader. In this volume Dr. Quackenbos tells the result of over seven thousand personal experiences which have led him to the positive conviction that hypnotism is the greatest regenerative force of the age. It is a unique and unparalleled record of the

Hypnotism as the great regenerative force of the age

Based on 7000 experiences with hypnotic treatment

great depravities resulting from excess and the wildest mental delusions, both the tragic and the absurd. This treatise is true to Science, and nevertheless written for "the man in the street." Dr. Quackenbos is a familiar figure in the world of medical hypnotism, and is a member of the leading societies for such research here and abroad. The published works of Dr. Quackenbos are *Hypnotism in Mental and Moral Culture* and *Practical Physics*. This new work is a distinct advance—the

NEW MENTAL HEALING

Dr. Quackenbos puts forward the theory that, by Hypnotic Treatment, it is easy to restrain a kleptomaniac, but not to make an honest man steal. Another most interesting argument advances the belief that this very century may demonstrate immortality itself by supermental communication, banish disease, and bestow painless dying. The already established scientific facts of hypnotism are followed up with the contention that, ethically, what it really means is the pure, free man coming to himself, and not the outside influence of another's will power—hence there is no possibility that evil can result from its application. There is a widespread public demand for full and authentic information regarding the principles of Hypnotic

Suggestion, which has become appreciated at its true worth as a great curative instrumentality in the fields of medicine and psychiatry, and as a regenerating power in that of criminal anthropology.

Dr. Quackenbos's book presents a Personal Experience which, in variety, general interest, and sociological promise, has never been equalled.

It explains the principles of Hypnosis and Rapport, and the rational methods of inducing the suggestible state.

It discusses Sleep and Degrees of Suggestibility; Suggestion and Auto-Suggestion, and their relation to Christian Science, Mental Science, Faith Cures, Osteopathy, Christian Faith, and Responsibility, with a summary of experiences.

*MINING
NUMBER*

HARPER & BROTHERS, NEW YORK
APRIL 11 1908

PRICE 10 CENTS

Financial Agents Wanted

A BIG Colorado mining and transportation enterprise, shortly expected to be in the dividend-paying class, but requires the expenditure of additional moneys in development to make it a thorough success.

The company owns outright 48 patented mining properties, has 9 other properties in process of patent, and owns bonds and leases on 10 additional properties, as well as transportation and drainage contracts with several important mines. The production record of the properties referred to has been in excess of \$1,000,000 in gold and silver. They are being opened through a large tunnel at great depth, which will mean the handling of the entire output at a very low cost of production and transportation, the portal of the tunnel being directly on the main line of the railroad. The company owns its own railroad switches, and is completely equipped with up-to-date machinery which is ample for the completion of the entire work outlined, over four thousand feet of the work having already been finished, and this work has positively proven that these ore bodies are permanent with depth.

The officers and directors are reliable business men, mining men and bankers, and they have personally invested, to date, over \$100,000 in aid towards the opening-up and development of the property.

This enterprise will stand the closest inspection of financial experts or mining engineers. Men of strong personality and ability can find an excellent opportunity to make a material profit by helping us finance this proposition. We do not want to hear from men who are satisfied with small money; we want men capable of raising \$10,000 to \$50,000. This proposition presents an opportunity for big investors to make a large profit on the money invested. It is not a cheap proposition, and we do not want cheap men to represent us. If you are the man we are looking for, we will be glad to hear from you, and will exchange references.

The proposition also presents an excellent chance for investment firms handling high-class securities. When writing, please give references.

TEN YEARS' EXPERIENCE

Our Advice Has Helped Our Clients to Make Big Profits

If you are interested in Western mining investments, especially in the stocks of the Nevada and the Colorado fields, we would like to hear from you, and will be pleased to place your name on our regular mailing list, so that we can send you our regular market letters and special reports.

Our firm has been established for the past ten years. We are members of, or are represented on, all prominent mining exchanges here and abroad, and can handle all business entrusted to us promptly. We make a Specialty of the Listed Stocks, and handle only such Securities as are, or will be, Listed on the Prominent Exchanges.

We have handled our business at all times along conservative lines, and in consequence have built up one of the largest brokerage businesses in the entire West. We have the best of facilities for the handling of all business, and can promptly execute either buying or selling orders. We maintain our own offices in the camps of Colorado and Mexico, as well as in Goldfield, Fairview and other Nevada districts. Our field men

have all had many years of experience in mining, and, as they are continually on the ground, we have been able to give our clients reliable reports, and the information that we receive has enabled us to pick the good investments from the bad, and in consequence our clients have made very large profits on the stocks purchased through our house.

If you are now interested in certain stocks and desire our opinion send us a list of the securities you hold and we will report to you promptly. If you are contemplating an investment in Colorado or Nevada mining securities, write us and we will forward to you a list of stocks that we believe are due for a sharp advance and will be money-makers.

We can give you the highest bank and commercial references as to our standing.

Get our list of Dividend-paying Mining Stocks that will net us to 20% per annum.

Write to-day for our regular Market Letter and Map of the State of Nevada showing the different camps, and Map of Goldfield, printed in colors, showing all prominent properties indexed. They will be sent free of cost to you. **USE COUPON.**

COMMENT

Keeping Open the Road to Court

THE gist of the decisions of the United States Supreme Court in the Minnesota and North Carolina cases is that the Court is still a part of our government, as intended by the Constitution, and will continue not only to keep open for business, but to keep clear and unobstructed the road by which applicants may come to it for protection, legislation by any State to the contrary notwithstanding. The trouble in both Minnesota and North Carolina was that the Legislatures, in fixing maximum rates of charges for the railroads, had made the penalties for violation of their laws so extremely heavy that the railroads would hardly dare risk even such breaches of the laws as were necessary to make cases for appeal, much less defer obedience to the laws under protection of an injunction, until their constitutionality had been passed upon by the court. In Minnesota every sale of a passenger ticket at a price exceeding the legal rate was made punishable by a fine not exceeding \$5000, or imprisonment for not exceeding five years, or both. Under the North Carolina law a ticket agent who violated the law to make a test case was sentenced to thirty days at stone-breaking in the convict gang. Of such gaudies the opinion of the Supreme Court, written by Justice PIERCE, is:

When the penalties for disobedience are by fines so enormous and by imprisonment so severe as to intimidate the company and its officers from resorting to the courts to test the validity of the legislation, the result is the same as if the law in terms prohibited the company from seeking judicial construction of laws which deeply affect its rights.

The Eleventh Amendment to the Constitution reads:

The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state.

It was argued that this amendment precluded the Supreme Court from asserting jurisdiction in these cases. But a clause of the Fourteenth Amendment reads:

No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without the process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

Judge HARLAN in his dissenting opinion declared that the Eleventh Amendment barred the Federal courts from passing judgment on these cases, but in the Fourteenth Amendment the other eight judges found warrant for their decision that

the laws appealed against were unconstitutional. The question whether the rates fixed by the States were confiscatory was not considered, but may and probably will be considered if new laws are passed which by modification of penalties meet the objections of the court.

"Ex Parte Young"

The reasoning behind the majority decision of the Supreme Court in the Minnesota case will be of interest even to the lay reader. The Eleventh Amendment, as observed, denies to the Federal judiciary jurisdiction in suits against a State by citizens of the United States. Presumptively a State officer represents a State. How, then, has the Supreme Court reconciled its decision with the amendment? Simply by holding, in conformity with its previous decisions, that a State officer in attempting to enforce the unconstitutional enactment of a State Legislature does not represent the State, such enactment of the Legislature being by the State unauthorized. In other words, though the acts of a State Legislature usually represent the will of the people—and that is as near as we need come in this case to defining the will of a State—they do not always do so. In the Minnesota case (*"Ex Parte Young"*), the enactment of the Minnesota Legislature, being in violation of the Federal Constitution, was not in accordance with the will of the people of Minnesota, who, since the time of their admission as a State into the Union, have been on record in the Minnesota Constitution as recognizing the illegality of such violation. The Minnesota, in passing the commodity rate law of April 18, 1907, exceeded its authority and acted merely in a private capacity, and it follows that the Attorney-General, YOUNG, acted in the same capacity when he attempted to enforce the enactment. He was no more fulfilling the obligations of his office than he would have been fulfilling them if he had acted as attorney in a divorce suit. As to Mr. Justice HARLAN's contention that the decision will place excessive power in the hands of the Federal courts by enabling them to "supervise and control the official action of the States as if they were 'dependencies' or provinces," it is to be noticed that under the decision the Federal judiciary can have jurisdiction only when a question of violation of Federal law is involved, and the Federal judiciary may be counted on to be reasonably certain that such a question is involved before it claims jurisdiction.

Discovery

The best law that the best Congress can pass is utterly useless until the Supreme Court decides as to its constitutionality.—*Representative WILLIAM SWAYER.*
 Ain't it awful, MAHATMA?—*New York World.*

And—to think!—the worst law of the worst Congress is in the same plight!

A Gentle Message from the President

The important recommendations in the President's message of March 25 are reiterated of his desire, expressed in his last previous message, for the amending of the interstate commerce law so as to let railroads make traffic agreements, and of the anti-trust law so as to permit such combinations as ought to be lawful. The present anti-trust law the President finds to be a good example of legislation "drawn in such sweeping form as to become either ineffective or mischievous." For the sake of business men, laborers, and farmers he wants it made over. But "nothing should be done," he says, "to legalize either a blacklist or a boycott that would be illegal at common law." He also wants a model child-labor law for the District of Columbia, and a constitutional employers' liability law. Looking forward like the prophet's messenger, he sees a cloud like a man's hand on the horizon. That cloud, he tells Congress, is tariff revision, and he begs Congress to begin to get ready for it, so that the Congress elected next fall will have proper information with which to attend to it immediately after the said Congress comes into existence. It is understood that Uncle Joseph CAYNE does not see in the cloud any resemblance to any hand he wishes to be seen holding at the present session, but the President's surer and recommendation will do for a plank in the coming Republican platform. Nothing that the President put into this message was so significant or so encouraging as what he left out of it. The message was comparatively short, and so

mild as to be read without distress by the most timid. It could almost be described as the message of January 31 boiled down and the scum removed.

Is It Really He?

"Richard is Himself Again" is the headline of the *Wall Street Journal's* review of the President's message. But is it he himself, or is he masquerading as the dove that brought the green back to Noah? And will be bring it to us? Let us hope so; let us hope so. We need it. If he is disguised, it is a very timely disguise.

Berlin and Dr. Hüll

I do not love thee, Doctor Hüll,
The reason why I cannot tell.

So it seems to be about Dr. HÜLL. There turned up late in the day in Berlin some reason, or apparent reason, for not loving him, but nothing that will do to tell. Inasmuch as Dr. HÜLL is an accomplished, detestable, and prudent person, and very unlikely to have put himself in a bad light in any definite particular, it is supposable that the vague misgivings about his being just the man for Berlin have something to do with the intimacy or remoteness of his connection with High Life in the United States. Perhaps Dr. HÜLL and his family are not as rich and fashionable as, in the opinion of the Emperor, it would profit us to have them. Curiously, the basis of objection, whatever it was, is supposed to have concerned the desire of the Emperor that Americans should be popular in Berlin. Well, there is little to say, except that Dr. HÜLL is a competent diplomatist, and that the task of the State Department in filling diplomatic posts would be very much lightened if Congress could make up its mind to provide houses in foreign capitals for our representatives to live in, and pay them salaries commensurate with their rank. Congress will not recognize that it has given them rank, but it has, and it refuses to pay them the money to support it.

Johnson's Way and Bryan's

Declaring that he has done nothing and will do nothing to obtain for himself the Democratic nomination for President, Governor JOHNSON says: "If, however, those who have the welfare of the country and the Democratic party at heart should feel that I am necessary in this year of grace, I certainly shall respond to any call which may be made upon me." The Governor's attitude is doubtful, muddy, and modest, and in very interesting contrast to that of Brother BRYAN, who is working from eighteen to twenty-four hours a day as advance agent of his own circus, urging the voters not to trust their delegates, but "if you want me nominated, instruct for me."

"True-seeking Hearts" no More

In the summer of 1905 two young Koreans, small of stature and modest of demeanor, came to the village of Oyster Bay, put on their best clothes, and asked for an audience with the President. They had with them a petition, signed by many hundreds of their countrymen, asking for Korean representation at the Portsmouth Peace Conference. The President was, of course, in no position either to deny or grant their request, but the press and the public were touched by the dignity of those "True-seeking Hearts," as the petitioners called themselves, and sympathized with the little Hermit Kingdom. The other day, however, WILSON CHANG, a Korean, self-styled patriot, shot and killed DENHAM WHITE STEVENS, the American counsellor of Japan, who really had the interests of Korea at heart. In Japanese control, without actual annexation, STEVENS saw possibilities of lifting Korea out of conditions brought about by centuries of intolerance and corruption. The odds are that it will go much harder with Korea now that STEVENS is dead. It is a poor service that CHANG rendered his country. Better far was the method of the "True-seeking Hearts."

A Sort of Man We Do Not Raise Yet

The late Duke of Devonshire (elsewhere considered) used to be described as the flycatcher in English politics. The elements of gravity, honesty, and patience in his character were very necessary to the Liberal party, and these, combined with his position as a duke and almost the largest landed proprietor

in England, made him for half a century a remarkable force in British affairs. Our American civilization does not as yet develop his type of man. We grow nothing of quite his sort either physically, mentally, or socially, and indeed seem farther from it to-day than in the time of GEORGE WASHINGTON. The duke was a very rich man and he liked horse races—facts that would argue some ways against his obtaining the confidence of the American people at this time, even if it were possible to overcome our national distrust of men who never at any period of their development were called upon to split the kindlings for the kitchen fire. He was a very able man, some near being a great one, and undoubtedly succeeded in being a great duke. Born to the possession in profusion of most things that men want, he showed very limited concern about getting anything more, and yet he never shirked the work that belonged to him, but with whatever diligence and sacrifice of ease was necessary lived fully up to the responsibilities and obligations of a great place in the great world. Are the great fortunes that are accumulating in these times in this country, and the families that show in so many ways the substantial quality of their fiscal and social power, destined some time to furnish us with "flycatchers of politics," who shall do for this country such service as for generations has been done for England by such men as this departed duke? We have got the men and the money, but not always in combination. The great difficulty here is for men who can afford to work for the people, and who have the ability to do it, to find their chance. Yet, once a man is launched in public life, it is a great help to him to have independent means. Mr. SEAWORTH might perhaps have stayed in the Senate if he had been richer; Mr. LITTLEFIELD might not be leaving Congress if he were richer; Mr. ROSS might not have served us so long in the State Department if he had not had some accumulated earnings to fall back on.

A Good Work Doubtfully Done

The police courts of the District of Columbia are doubtless competent to handle the case of Congressman HEYMAN of Alabama, who had a difference with a drunken negro ruffian on a Washington street car, in the course of which the negro got a wound in the head and a bystander a slight hallet wound in the leg. The fact that Mr. HEYMAN has been urgent in trying to get a "Jim Crow" law for the District, and the additional fact that he carries a pistol, should not complicate the case so seriously as to overstrain the police court judiciary. To promote seamy behavior on street cars is a good work, but half enough attended to by our citizens, but a pistol seems a very dangerous tool to use in doing it. The court that gets the facts should be able to deal with them.

Judge Wilfley's Case

Mided by an early report, the WEEKLY was somewhat premature last week in saying that Judge WILFLEY of Shanghai had been exonerated by the Judiciary Sub-committee of the House. The committee reported that the charges against him did not warrant impeachment, but they intimated that he seemed to have used his power harshly. This leaves the case in an unsatisfactory posture, and it is likely that the judge will try to secure such an examination into his conduct, by impeachment or otherwise, as shall give him an opportunity for defense.

Bomb-dropping in New York

The bomb-dropping episode in Union Square, New York, on the afternoon of March 28 (of which there are pictures on another page), is still, at this writing, under investigation by the newspapers and police, with what result has not yet transpired. So far, little more is known than that a nineteen-year-old Russian Jew named SILVERSTEIN came to a mass meeting of socialists with a bomb to throw at the police, and handled his explosive so ineptly that it blew off his own hand, blew out one of his eyes, and killed a bystander, but harmed no policeman. The interesting question, not yet solved, is whether his effort was a mere sport of personal enterprise or the result of a plot or concerted plan. The episode so far as it has developed seems adapted to make bomb-droppers unpopular at socialist meetings. For the meeting in question no permit had been obtained, and it was therefore broken up by the police, as shown in the pictures.

The Stock Argument Against Woman Suffrage

The opponents of woman suffrage in the United Kingdom have naturally been startled by the fact that a bill conferring the Parliamentary franchise upon all such women as are householders had according to it a second reading by a majority of 179 in a fairly full House of Commons. Since 1867, when JOHN STUART MILL first brought up the question on an amendment to the second reform bill, a second reading of a bill or resolution more or less to the effect of the bill now pending has been agreed upon four times, the last occasion having been in 1904, when the majority for it was 114. It is the singularly increased size of the majority recorded the other day which justly is accepted as an augury of early victory. Indeed, as a matter of fact, we are informed on good authority that out of the 470 members of the House more than 400 have pledged themselves in favor of woman suffrage. It is true that the present bill was referred to the Committee of the Whole, which is, of course, equivalent to stifling it for the present session, unless the government should give it special facilities, which is a most unlikely event. Nevertheless, woman suffragists in England, in view of the steadily increasing majority, have a right to feel confident that they will triumph in the near future.

Meanwhile, as might have been expected, the opponents of woman suffrage are making a stand in the last ditch. The London *Times* feels constrained—in view of the fact that there are a million and a half more women than men in the United Kingdom, and that nearly all of the former read newspapers—to evince some condensation and complacency in its discussion of the question. It admits that few people would now be prepared to deny that certain exceptional women are better qualified than their gardeners or their coachmen, or many of the less educated men in England, to register a vote soberly and wisely. Of the humor latent in that statement the *Times* is entirely unconscious. While still in an indulgent mood, it proceeds to say that if it is prepared, it says, even to go farther, and to acknowledge that, logically, it is difficult to meet some of the arguments for giving women votes. With a gracious candor it concedes that within the last century women have shown a capacity for education unknown of before; have made names for themselves in science and in literature; and have amply proved their capacity for work as organizers and administrators in municipal affairs. We regret to say that immediately afterwards the *Times* falls down. For it asserts that such an admission by no means helps to prove that women as women are qualified to share the responsibility for governing the United Kingdom and the British Empire. Of course a mere *pse* due to this effect proves nothing, and the *Times* tries to make it good by another assumption equally unfounded, that when people talk about women's successful exercise of the franchise in some States of the American Union, in Finland and in Australasia, they forget that in all these cases the problems of government approached more nearly to municipal questions than to those with which the British Parliament has to deal. Is it possible that the editor of the *Times* editorial imagines that there is anything municipal in the problems that have to be solved by the national Parliament of autonomous Finland, to which, by the way, women not only return members, but are themselves eligible; or in the Parliament of the Australian Commonwealth, where, as it is well known, women possess the suffrage. Conscious, apparently, of the weakness of the position thus taken up, and, possibly, inclined to regret some of its admissions, the *Times* finally falls back on the assertion that the fact brutally resolves itself to this: Human society depends in the last resort on force. Happily force is not constantly "employed," but until the world becomes very different from what it is it must always be latent. What the majority in any age think to be right and just must be imposed on the minority who do not agree with them by the belief that in the end the former would fight to maintain their ideals. A society largely governed by women, as the United Kingdom would be, if it had adult and universal suffrage, could not have, the *Times* says, this sanction for its internal laws, or for the external policies of peace and war which it might adopt. If women, by virtue of their numerical majority, gave laws to Great Britain, they would have to persuade men to enforce them, and men would not do this unless they also appeared of it.

This argument from physical force is old and stale. It never had but one advocate of weight—HARRISON SWANN—and there is reason to believe that, toward the end of his life, he was disposed to retreat from the position which he had originally taken, but which, ultimately, he must have perceived to be untenable. As a matter of fact, there is absolutely nothing in the argument. That has often been demonstrated from the day of JOHN STUART MILL downward, but perhaps the captiousness and futility of it have never been shown more clearly and convincingly than they are in a letter published by the *Times* itself from LORNE ZENKOWSKI, the well-known novelist. The objection to woman suffrage, the objection, namely, that women do not bear arms, is decisively quashed by the remark that, though women must not bear arms, they bear soldiers, and also by the fact that, so far as the United Kingdom is

concerned, soldiers and sailors who bear arms form just the one class of men who have no votes. It ought also to be kept in view that actual fighting is only an index, and often a most imperfect index, of a nation's strength; and, moreover, that battles are won in universities, factories, and playing-fields, as well as on battle-fields, to say nothing of woman's contribution as a taxpayer to "the alms of war." It seems seldom to have been noted since it was pointed out by JOHN STUART MILL that this, the so-called fundamental argument against woman suffrage, would, if logically applied, disfranchise not only all women, but all men above military age. In other words, men over forty-five, who, as the wisdom of all ages has conceded, are the best fitted to act as a nation's counsellors, would be relegated to silence. Their mouths would be stopped because their brains might be less developed. The corollary needs only to be stated to be recognized as decisive. Then again how unintended, how utterly without historical precedent, is the assumption that men would show fight if women outvoted them. Men do not show fight against each other because they are outvoted at the ballot box or in the national legislature. The truth is that all the great religious, political, and social advances of mankind have been brought about by minorities. When CONVENTINESE the first issued his edict of toleration, the Christians, numerically constituted but a minority of the population of the Roman Empire, The Jacobins dominated the first French revolution, but there never was an hour during the epoch when they could rally a majority. If women in England, at a given election, happened to return a majority of the members of the House of Commons, they would undoubtedly control the government if they were united, but there is not the slightest ground for imagining that, in such an event, the male voters would refuse to obey the administrative power. The irresistible machinery of official coercion would be arrayed against them. To suggest, moreover, that political parties would ever, under normal circumstances, be formed on sex lines is preposterous. Such a sex division is impossible, as CHURCHILL pointed out long ago in the lines:

We see that Nature doth contrive
That every little boy or girl,
Who's born into the world alive
Is either a Little Liberal
Or a Little Conservative.

Personal and Pertinent

THE Alexander Hamilton National Memorial Association has been formed in Washington to raise funds to set up an adequate figure of HAMILTON in bronze or marble somewhere in Washington. Strange to say, there is no outdoor memorial of him there. The purpose is worthy, and we wish it success. HAMILTON is one of the post-revolutionary figures now on exhibition in Dr. MITCHELL's novel now running in the *Century* Magazine. He also figures in OWEN WISTER's recent *Seven Years of Washington*. The evasive FRANK SARGENT takes exception in the *Springfield Republican* to Mr. WISTER's suggestion as to the prodigious influence that HAMILTON exerted over Washington. "WASHINGTON," says Mr. SARGENT, "had a good influence over HAMILTON, and when that was withdrawn by death HAMILTON's preference deserted him; he broke up his own party and went to his death in a duel which a really great man would have avoided. HAMILTON was a good instance of talents without character, while WASHINGTON's character was so heroic that his really great talents suffered by comparison." That will set us to go to HAMILTON's monument, but it is a shrewd and interesting opinion.

In commenting upon certain alleged diplomatic expressions of Viscount Aoki while he was Japanese ambassador to the United States, the San Francisco *Chronicle* announces the existence of a "persistent" rumor to the effect that his remark was "the result of representations or intimations from Washington that his attitude toward this country . . . too closely resembled the Japanese attitude toward China." Now, whether this rumor has persisted exclusively within the mind of the *Chronicle*, or in Japan as well, we do not know. But certainly, we can think of no other places where it could have done so without our having heard of it before. As for Japan's attitude toward China, as interpreted by the *Chronicle*, it appears to be nothing more nor less than assertiveness in interfering with China's domestic legislation. Moreover, in the opinion of the *Chronicle*, it is "not at all unlikely" that Viscount Aoki assumed such an attitude toward the United States in the matter of exclusion legislation. Nevertheless, he was not so presumptuous whenever it follows, and is a fact, that for such presumption our government did not request his recall in any way whatever.

The career of the late Senator WILLIAM PANDOLPH WYTHE, of Maryland, recalls Emerson's dictum in "A Fable of the People," that the greatest man is he who can stand alone. When WYTHE was appointed by HARRISON SWANN to fill the seat in the United

States Senate left vacant by the resignation of RICHARD JOHNSON, he was forty years old and comparatively unknown. In the struggle between Congress and President JOHNSON, WHITE made brilliant speeches upholding the rights of the President. When Senator CONGER of California moved to "dispend with the further reading of the message," which the President had just then sent to Congress, WHITE arose to protest against what he deemed a slight upon the office of the Chief Executive. Against WHITE there were opposed such men as SUMNER, EDWARDS, MONROE, CAMERON, WADE, and CONKLING. The Senate was like a boiling cauldron, and the Democrats in those early reconstruction days were few. But WHITE, persisted, spoke on, and won over to his side WILSON of Massachusetts, and then HEDGECOCK of Indiana. He secured a postponement of at least a day before a vote was taken, and the next day the Senate agreed with WHITE that the message be read. "In later years, when Democratic enthusiasm ran high for BRYAN, Senator WHITE, with clear vision and sound judgment, stood boldly out against what he called "the heresies of professors of Democracy." He was indeed a lover of strength. That is why the Governorship of Maryland, upon which he entered in 1871, was not, as he then supposed, the climax of his political career. Previous even to the sight of the people is a man who knows when he is right. Governor WHITE was still in the United States Senator, Mayor of Baltimore, Attorney General of Maryland, and again Senator.

There is a difference between a big man and a great man. One would hardly call the late Duke of Devonshire great, but he was big; very big—a GIGANTIC CLEVELAND kind of man, built on British lines of British materials, and of a magnificent respectability. A man of sentiment and of conscience; very rich, rather lazy, unambitious, of a sluggish temperament, and yet a man of great love and immense influence, and in his life governed by the sense of duty. It reads the mind, in the midst of earthly agitations, to think about that big, tranquil, doubtful duke, with his enormous belongings and his simple heart. He never bothered himself to provide an heir of his own body for the estates that came to him. When he was young he fell in love with a lady who married the Duke of Manchester, and continued to be his wife until he died forty years later. "But though she was married to the other man [we are quoting a newspaper], her devotion to HARTINGTON [as he was then] and his devotion to her were famous. She counselled him in all the important affairs of his life, spurred him on, and was his warmest friend. Nobody thought of inviting one to a house party without the other." And in due time, after forty years of unswerving able duty, they got married. There is a pretty story of patience and affection. Another story that is in the newspapers about the big duke is that he was invariably late—late at the House, late at cabinet meetings, late at the railroad station, late at all times and places. "The parson Mr. CROMBIE related to Devonshire was 'the late leader of the Liberal party.' His tastes were simple. The hardest rooms in his mansions were the Duke's own. He was a good hand at whist, fond of racing and the traditional English sports. His tastes were popularly supposed to lie between the Blue Book and the Racing Calendar." He was a continuous though reluctant power in English politics, a man whom wanted nothing for himself and whom everybody trusted. Two or three times the Premiership was offered to him, but he would not have it; but he was a member of the House of Commons from 1857 till he went to the House of Lords in 1891, and a high officer of state in many cabinets.

Correspondence

TOO TENSE A SUBJECT

BIRMINGHAM, N. Y. March 22, 1898

To the Editor of Harper's Weekly:

SIR,—What about Bourke Cockran?

I am, sir,

A. S. MONTGOMERY.

PUSH IT ALONG!

NEW YORK, March 24, 1898

To the Editor of Harper's Weekly:

SIR,—How much longer is the American people to be compelled to use Godless postage stamps? If "In God We Trust" is to be put back on the gold coins, put it on the stamps, too—unless, indeed, for variety's sake it would be fitter to put on the stamps, "God Bless Our Home."

I also favor making, "I want to be an angel" the sixteenth amendment of the Constitution. Those of us who don't want to sight to, and a sentiment so expressive of the prevalent feeling of the time should unquestionably be received in our own fundamental law.

Don't you think so?

I am, sir,

PETER.

"GARNALLOPS"

ANIMATED, E. L. March 25, 1898

To the Editor of Harper's Weekly:

SIR,—In your issue of March 21, 1898, on page 7, your comment on Colonel Watterston, and the following appears: "But the overgrown Colonel garnallops up and down." etc. I looked in Century, Standard, and Webster's dictionaries without finding such a word as "garnallops." Is this a typographical error? If not, please give us your authority for the word.

I am, sir,

HELEN C. WALLACE.

The word "garnallops" was composed in this office out of materials gleaned from "garnishes" and "gallops." Its purpose is to convey in one package the ideas of vanity and easy motion. It has not been patented, and anybody is free to use it.—EDITOR.

OUTDOOR ADVERTISING—AMERICAN CIVIC ASSOCIATION

BIRMINGHAM, Pa. March 26, 1898

To the Editor of Harper's Weekly:

SIR,—In your issue of March 7, there is printed an editorial entitled "The Bane of Travel," which refers to the billboard nuisance. It is so phrased as to be a most efficient argument against the poster rampant from the standpoint of the better education of our people through their environment, and I am extremely glad to see such an editorial in an influential periodical.

In the body of the editorial comes the following sentence: "Are there not enough people in our own land offended by hideousness to form a society for protesting against making the country through which our trains run an offense to taste?"

It is my purpose to call your attention to the fact that the American Civic Association, which led in the measurably successful attempt to take Niagara Falls from private control and save at least a part of its glory for all the public, is committed to the fight against the abuses of outdoor advertising, and is carrying on an active propaganda all over the country in pursuance of that fight.

Addresses have been made in scores of cities, illustrated by examples of the hideousness which surrounds the American child, whom we hope will have a better appreciation of art while we force them to live in sordid ugliness. Legislation has been instituted in many communities and in several States, and direct attempts have been made to approach the evil by means of showing its poor business economy; for it is believed that this shrieking outdoor advertising is unprofitable.

You will be interested in an extract from a letter just received from one of the chief offenders, as follows:

"As in the question of civic beauty, we must agree that our scenery, either rural or urban, is not improved by the presence of the many colored billboards, but so long as they are permitted and are available at a reasonable price, the progressive advertiser of today is going to use them."

This is a significant statement of the purely utilitarian view taken by a concern which depends upon the good will of the whole country for the purchase of its wares.

We are efficiently aided in our crusade by the shagbarts of the billboard men. These gentlemen insist that we are "cranks," and that all peripherals supporting us are actuated by selfish interest. Note the following extract from the *Billposter and Distributor*, the main organ of the billposting craft:

"The reformer at large is mostly an idealist, who would, like Ruskin, abolish the railroad to preserve natural scenery."

These gentlemen continually insist that America is a purely commercial nation, and that any one who is not pure but advocates commercialism above all things else. They are inconsistent in their suggestions; as, for instance, when Mr. Charles O. Davis, an attorney, led a noted billboarder of New York, personally attacked me on the occasion of a billboard address before the Spring Club at New York, by saying:

"If Mr. McFarland prefers God Island to New York as a place of residence, let him go there by all means. Outdoor advertising is the blood of the commerce of this nation, and you can't stop it from to save your life. . . . We are not here to put Titians and Michelangelo on every street corner. The billboards are here, and they are going to remain as long as American commerce rests on the solid foundations on which it stands today."

I venture to suggest, in bringing to your attention the fact of the American Civic Association's work upon this subject, further active interest in your part in calling the attention of your readers constantly to these desecrations of scenery as well as of the works of man. In Berlin there is advertising near the Imperial palace on Unter den Linden, but it is confined to a simple, small, completely controlled kiosk. Near the Capitol in Washington, on the contrary, are hideous, wild-spread billboards, and the Lincoln statue is practically submerged in advertising.

If you could find it practicable to ask your readers to express their opinion as to whether or not they are attracted to unattractive articles by means of this sort of offensive advertising, good would be done. This association distributed a large quantity of inquiring post cards at Niagara Falls last summer, the returns from which show that eighty-four per cent. of those who noticed the ugly advertising on the Canadian side were disapprovingly impressed as to purchasing the articles there exhibited.

I am, sir,

J. HORACE MCFARLAND

Unlocking \$47,000,000

By VICTOR ROUSSEAU

HE "panic" is over!

On October 23, 1907, that period of financial stringency and business depression to which the term "panic" was popularly devoted was ushered in by the closing of the doors of the Knickerbocker Trust Company. The March 26, 1908, the reopening of that institution marked the close of the crisis. During the first half hour after recognition of business more than \$1,000,000 had been received for deposit at the main banking house, and twice that sum was received during the day.

That the Knickerbocker Trust Company was enabled to reopen at all is due almost entirely to the gratuitous services of one man, Mr. Herbert L. Satterlee, the legal representative of the depositors. The story of his battle of nearly five months of war against the declared hostility of opposing forces, against the suspicion of his clients and the indifference of the uninterested, reads like the romance of some galadin. And now it is ended, and the Knickerbocker Trust Company has opened its doors again.

"I'm so tired," said Mr. Satterlee upon the evening before resumption. "I'm almost too tired to think. For months I have been working night and day, seeing from forty to fifty depositors daily, listening in every kind of hard-luck story, leaving this office at two or three in the morning, and receiving visitors at nine the next day, even on Sundays. I've dropped all other business to see this thing through. Still, I should be more tired, I think, if it had failed. I think I should have hidden myself in some sanitarium, or gone to Meikidown. Now—"

"You'll take a long holiday?"

"No, they've put me in as one of the board of directors," he answered, whimsically.

Here is the story of Mr. Satterlee's work:

When the Knickerbocker Trust Company closed its doors, just before noon on October 23, 1907, the statement of the Superintendent of Banks that he had taken the institution in charge marked the greatest failure that has ever occurred in the United States; one equaled elsewhere, perhaps, only by the failure of the Barings in London in 1890.

The dividends of the Knickerbocker Trust Company, which, before the business depression had begun, had aggregated more than sixty million dollars, its ornate marble office at the juncture of Fifth Avenue and Thirty-fourth Street, and its widespread banking connections in other States, had given it the widest celebrity. The fact that it cleared its checks through the New York Clearinghouse and carried the largest cash reserve of any trust company in the country had won for it public confidence, and it had more than 18,000 depositors. The resignation of Charles T. Barney, on October 21, found the public quite unprepared, and there was hardly time to realize what had happened before the run began. During the hours that elapsed before the Superintendent of Banks took charge of the institution more than \$5,000,000 had been paid out at the main office and the three branches in Wall Street, Harlem, and the Bronx. The last statement which had been filed at Albany had showed a surplus of nearly \$5,000,000.

The closing of the Knickerbocker's doors marked the opening of the panic. Several small banks and trust companies failed in rapid succession, and other trust companies were compelled to seek outside aid. Two had to be carried through the panic by a syndicate of the largest financial interests in the country.

On the application of the Superintendent of Banks, the

Attorney General of the State at once began suit to declare the company insolvent and to wind up its affairs. He applied for temporary receivers, and the judge immediately appointed Ernst Thalmann, George L. Rives, and Henry G. Ide as temporary receivers to take charge of the institution.

Almost simultaneously the directors of the company appointed a committee to protect the stockholders and look after the interests of themselves, as depositors, and of the others who would join with them. Their plan for enabling the company to resume was based upon the purchase by the depositors of six per cent. gold debentures based on the general credit of the company to the extent of fifty per cent. of their deposits, the remaining fifty per cent. to be withdrawn only by installments. This enforced investment not appealing to the depositors, other committees were formed and plans put forward by them, based on a largely increased issue of the company's capital stock, which the depositors were to be asked to take in payment for a large proportion of their claims. None of these plans met with favor, because of certain legal objections which were raised, and because depositors did not want to take stock in a trust company which carried with it a legal liability.

In the first week of November several of the largest depositors asked Mr. Satterlee to organize a committee and formulate plans for the depositors' benefit. Having in mind a similar situation with regard to a smaller institution several years ago, in which he had succeeded in getting each depositor to guarantee the claims to the extent of fifteen per cent. of his own deposit, Mr. Satterlee thought that even here, in the case of a failure of such magnitude, something of the kind might be done, provided that the depositors could be convinced that there would be no preference as between one man and another, and that all would be treated upon exactly the same basis. This seemed to be the only course available, because every possible source of money supply had already been taxed to the utmost to keep the doors of other institutions open, and to retain many business firms in solvency. There were only two sources from which it was possible to obtain the money necessary to make up the loss of the eight million-dollar drain caused by the run and to provide sufficient working capital. The source was the stockholders of the company, and the other the depositors themselves.

The impelling motive of the stockholders was naturally to protect their investments as far as possible, in the extent of their means, and it was only by convincing depositors of the fairness of the plan that they were induced to make resumption possible by consenting to enforce their claims to the necessary amount.

The plan for the resumption of business, which was afterward endorsed and adopted by all the other substantial interests involved, and has since been approved by the court and the Superintendent of Banks, was based on the theory that the stockholders should turn the company over to the depositors until their demands were satisfied, contributing the sum of \$2,400,000 in cash towards the requirements for resumption; and also that the depositors should guarantee the solvency of the institution by releasing their claims on assets to the extent of thirty per cent. of their deposits, on which they receive "surplus certificates," payable semi-annually out of the company's net earnings; also agreeing to withdraw the remaining seventy per cent. in installments extending over a period of thirty months. The magnitude of the task attempted may be inferred from the fact that there was nearly \$17,000,000 worth of deposits tied up, represented by an army of depositors, residing for the

Herbert L. Satterlee

WHO OPENED THE CLOSED DOORS OF A GREAT BANKING INSTITUTION

most part in New York or near it, but also all over the world. Almost all had been stung by the failure and distressed by the financial calamity which had befallen them, and they were naturally chary of surrendering their rights to any extent. Moreover, the facts which had been revealed concerning people who had occupied important financial positions in institutions that had hitherto been thought safe and sound made them suspicious and reluctant. The tragic death of Mr. Barney, on November 14, had seemed almost to destroy the last hope of redemption. Nevertheless, the committee persevered in its investigations of the assets of the company and of its liabilities, and in appealing to the depositors again and again to have some faith in some one, and to testify to their reliance in the fairness and practicability of the plan by assigning their accounts. In order to insure success, three of the largest and best known trust companies of New York were asked to act jointly as the depositories of the depositors' assignments. The committee was made up of men never previously connected with the trust company as stockholders or factors. Every member of the committee, as well as its counsel, undertook the work with the announced intention of doing so voluntarily and without compensation.

It was slow work to make the depositors realize that the committee was in earnest in this. The press was also slow in coming to understand it; but when it really understood, it probably contributed more than any one element to the ultimate reopening. Night and day, with little regard to Sundays or holidays, the work went on. Circulars were prepared and sent to depositors wherever their addresses could be found. Personal letters were addressed by members of the committee and their friends to those who hesitated. A canvass of deposits was inaugurated, and at one time 160 people were actively at work visiting depositors, explaining the plan, and securing assignments.

A committee was formed of distinguished members of the bar, who advised their fellow lawyers to assist in this work of restoring the public confidence. The presidents of half a dozen of the largest banks published a letter over their signatures endorsing the plan. Ministers and priests who came in daily contact with the hardships caused by the failure lent their active encouragement and aid.

Another important part of the committee's labor consisted in inducing borrowers from the trust company to make payments on account of their loans, or to extinguish them entirely, thereby accumulating the necessary cash in the hands of the receivers to meet the requirements for reopening.

All this time, of course, there was active opposition from those interests that saw a gain in liquidation and no profit to themselves in the redemption. There was plenty of suggestion from those who did not help, and much criticism from those who thought the plan might have been undertaken in some other and better way. The beginning of every week found a new set of problems to be overcome; but the work went steadily on, until the point was reached at last, on March 7, when the Superintendent of

Banks, having made an independent examination of the plan and manner in which it was being executed, announced that in his opinion business could be resumed on Thursday, March 28, at noon; and Mr. Justice Lester W. Clark thereupon entered an order to that effect. The satisfactory result of the efforts of the re-organizers was that the \$2,750,000 of deposits represented by the committee itself had been rolled up to \$37,000,000, or more than eighty-five per cent. of the net deposits, after deducting the claims of the savings banks and moneys deposited by the court, which, under the law, are preferred claims.

This gigantic task was accomplished by the business aid rendered by the stockholders, and by the depositors themselves. Liquidation would have involved comparatively small and certainly infrequent dividends, whereas the assets, sold as at a sheriff's sale, would melt away like ice beneath an August sun. It would have entailed long-drawn-out hardship upon the depositors, the reorganization of a cloud of litigation, and the abandonment of many enterprises dependent upon the solvency of the Knickerbocker Trust Company. Instead of this, there has been secured the gradual payment of every deposit in full, and the immediate freeing for circulation of many millions of dollars.

Mr. Satterlee's personal exertions in this matter have been enormous. "Even on March 8, twenty-four hours before the court was to render its decision, we were not in a position to reopen," he said. "On that day telegrams of fifty words apiece and more were sent out to over a hundred depositors. Responses poured in by telegram, by mail, and by the next morning we were at last able to secure the court's permission to commence business again."

"You would even doze here with stories of distress," continued Mr. Satterlee. "One would tell me how his daughter had tuberculosis and he had to get the money to take her to California as a last chance for her recovery. Another had a sick wife who had to undergo an operation. Another had to sell his store at a nominal sum and go to work as a clerk again. 'I hate to say it,' they would say to me, 'but isn't there some back door to this arrangement? You're not doing it for nothing, are you?' And in every case I was able to back the depositor straight in the face and tell him that there was no back door, that we were all standing in it together, and that nobody had any preference of my kind."

"The apex of it all is that the trust company is solvent, and that the depositors have certificates of deposit, good to sell or borrow on. But the point which especially impresses me is this, in spite of all the attacks upon capital during the past few years, the public's faith has not been undermined. We've had the age of the man with the stone axe and the man with the hoe. What are we coming to now? The man with the megaphone? What are they preparing for? A Commune? It's Roosevelt against Bryan, each vying with the other in denunciation of capital; and yet, in spite of this, the public has been asked to do a thing unheard of: to renounce their rights to everything that they possessed, to permit us to give away, sell, or otherwise dispose of their money as we thought best, and they've done it!"

England's Next Prime Minister

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

HE Prime Minister gets no better. He has only been able to make two or three brief and faint appearances in the House this session. He is at present, I fear, suffering severely from the after-effects of influenza, and there is unfortunately but little likelihood that he will be able to return to active duty. The nation watches the daily bulletin with an anxious solicitude. I do not think the English people quite realized how much they had grown to like "C-B" until he fell ill. I am not sure that even the Liberals were fully aware of their dependence upon his leadership until it was temporarily withdrawn from them. Men talk of the success of this minister and of that of Mr. Morley's admirably balanced handling of India, of the confidence everywhere reposed in Sir Edward Grey, of Mr. Lloyd George's infusion of a new and beneficent life into the Board of Trade, of the patience, originality, and breadth of view that Mr. Asquith has brought to bear upon the problems of military organization. But the greatest success of the present government has been "C-B" himself. I am only interpreting what I feel sure to be the non-partisan awe of the country when I say that "C-B's" development has been the pleasant surprise his ministry has afforded. His hold over the nation, over the House, and over his party, is something that two years ago would have been thought incredible. When he became Premier there were few who thought him equal to the responsibilities of the post. Few thought he could sustain the double burden of the Premiership and the leadership of the House of Commons. On all hands it was quietly assumed that at the first convenient opportunity "C-B" would repair to the seclusion of the House of Lords, taking the Premiership with him, but leaving the leadership of the Lower House in younger, firmer, and more determined hands. And it gives the measure of "C-B's" triumph that to-day, even if such a development were politically possible, not a single one of his followers would welcome it.

What is the explanation? Nobody exaggerates either "C-B's" qualities or his attainments. Nobody ranks him as a great statesman, or a great intellect, or a commanding leader. What people feel is that he fills a very difficult position with a success that many able men, men of far more definite opinions, and of far greater force of character, have failed to achieve. His triumph has been pre-eminently the triumph of personality. "C-B," like Mr. McKinley, has the rare gift of smoothing things out and reconciling the most opposing views and dispositions. Himself a monument of humorous common sense and cheery clarity, he radiates an atmosphere that makes for agreement and co-operation. There is nothing elusive or baffling about him. The suspicion of disingenuousness which stained the latter years of Mr. Balfour's government is the last that would attach to "C-B." His whole ease is got up in good, plain black and white. A pork butcher could understand him. He is a master of all the persuasive arts. He oils the machinery of party government with a loving and imperturbable patience. No one can quarrel with him, because he simply declines to quarrel with any one. His massive urbanity is an emollient that cures the most recalcitrant faction into obedience. He rules without friction and leads, if the "bull" may be forgiven, by a series of gentle pushes. For the past two years he has been a centre of accommodation and harmonizing influence round which a heterogeneous party has revolved not only with gratitude but with affection.

But the British Empire cannot be governed from a bed of sickness, and the day is approaching when "C-B" will either have to transfer himself to the Lords—a step from which, in view of his political campaign against the Upper Chamber, he naturally shrinks—or else resign the Premiership. There is no question as to who will succeed him. Mr. Asquith, at present Chancellor of the Exchequer, is the man on whom the mantle will inevitably fall. Already he is the Prime Minister's alter ego. Already he speaks, as it were, from the threshold of No. 10 Downing Street. Within his own party he has no rival. Mr. Morley is a statesman, but not a politician. He would be Prime Minister in Utopia, but not in England. Sir Edward Gray, with very few men know, but all men trust, has restricted himself to a single sphere of politics, the importance of which is far in excess of the interest group he speaks in it. Mr. Lloyd George, in turn, has not yet come. Mr. Haldane, who possesses perhaps the profoundest intellect now devoted to the service of the state, is regarded by the nation rather as a mind than as a man. There is no one else. Everything points to Mr. Asquith as the inevitable Premier of the future. He alone raises the range of the chamber and the kind of mind upon the people that are the essential qualifications for the highest office of all.

The present session is, therefore, a crucial one for him. Not only is he in charge of the Licensing Bill, which is providing what promises to be the most roundabout political conduct of the

past fifteen years; not only has he to introduce the Budget, and frame his momentous proposals for Old-Age Pensions; not only will his place during the next few months be in the thickest of the fight, giving and receiving the hardest of blows; but he has also to stand the judgment of the country, of Parliament, and of his followers as a prospective Prime Minister. Men listen to him and watch him less for what he is than for what he so soon must be. It is not the Chancellor of the Exchequer that engages their attention. It is the Prime Minister in embryo. They know already what Mr. Asquith is capable of in the rough and tumble of Parliamentary warfare, how strong and effective a gladiator of debate he is and always has been, how inconspicuously inured are his presentations of even the most complex measures. But whether he has also the gifts of personality and of brimpage that are not less essential to successful leadership, whether he is skilled in the vital arts of managing men and can inspire that warm feeling that is worth infinitely more to a party chief than mere admiration of his talents, whether he possesses or can acquire any of "C-B's" mellowness and his remarkable knack of bringing men into line—these precisely are the points on which more light is being anxiously sought.

It is not, I am bound to say, being sought without a certain mingling. Few members of the Liberal party relish the prospect of the change from "C-B" to Mr. Asquith. The Labor men say almost, indeed, he said to reveal it. There is a free recognition of his qualities as a first-class fighting man, who is always supremely sure of himself, who is never far below the top of his form, who can bring all his guns into action at a moment's notice, who will stand up to any one, and whom very few can stand against. Nor, of course, does any one question the virility of his success or the high and genuine character of his abilities. He has made his way, every one agrees, altogether on his own merits, by his own exertions, and without any adroit tricks and whatever. His career at Oxford was surprisingly brilliant. He quickly followed it up by an even more brilliant success at the Bar. Brought into Parliament under Mr. Gladstone's auspices, he at once made his mark as a debater, as almost, indeed, the only debater on the Liberal side who could hold his own against Mr. Chamberlain. In the last Gladstonian ministry he held the post of House Secretary, thrust himself with arduous into the duties of his office, and raised it by his firmness, sympathy, and zeal into one of the most active and beneficent of all the government departments. He did for it, in last, very much what Mr. Chamberlain did for the Colonial Office, and what Mr. Lloyd George is doing now for the Board of Trade. During the Boer war Mr. Asquith resplended himself under the Boer banner and gave the Unionist government an invaluable support. When the fiscal controversy broke out he plunged into it, followed Mr. Chamberlain from town to town, met him speech for speech, and worked perhaps harder and more effectively than any other Liberal to win the great electrifying victory of 1901.

The minglings, therefore, at which I have hinted do not relate to Mr. Asquith's capacity as an administrator or a debater, or to his services in the Liberal cause. They have reference solely to the personality of the man. He is not popular with the rank and file. I have known him to succeed by a speech of pitiless, piled-up lucidity in lashing his party into its enthusiasm, such as even Mr. Gladstone could not always evoke. But the enthusiasm was wholly intellectual; the cheers were for the achievement, not for the man. Lord Rosebery, it is true, has said that Mr. Asquith possesses qualities of heart even more remarkable than his qualities of head. But the average man in and out of the House and Commons remains unimpressed. Mr. Asquith's is not, I should say, an expensive nature, or if it is, his colleagues in Parliament are too rarely allowed to catch it in its more glowing and genial moments. His political manner is not ingratiating. It is even at times a little stifled. There is about him a warning air that fools will not be suffered gladly. Men accuse him of an Oxford superiority. They suspect that his inclination is to treat stupidity as a sort of crime. His alert and energetic bearing is the expression, so they say, of a disposition that is fundamentally self-centred and not without its spice of intellectual arrogance. I do not know whether this is really so, but I think it probably is. There is undoubtedly a lack of warmth and tone and color about Mr. Asquith. His speeches, for instance, though possessed of many fine qualities, though always pungent, vigorous, and concise, and as good as any public speaking can be that is not oratory, always impress me as being a little bloodless, a little too uniformly and rigidly excellent. The vibrant voice, so resonant and full, the abrupt, dramatic gesture, the ordered, resonant period, just fit to convince one that the speaker feels, feels the passion he is declaiming. He always seems to know just what he is going to say; he will not for a moment be carried out of himself, he allows no room for "the magic hand of chance." I have a suspicion that Mr. Asquith is simply incapable of an indeliberation. The party of all the enthusiasms is destined to be led by the man with none.

Oklahoma's Claims to Distinction

Holding down a Claim in Roger Mills County

Keeping down the Death-rate

A Group of Oklahoma's early Settlers

Bacon born on a Ranch near Pawnee

WHEN Oklahoma formally entered the sisterhood of States upon the sixteenth day of November, 1907, the effluvia East little dreamed what strange and wonderful signs would come from the far, wild West. The illustrations show some of these marvels, and similar scenes are said to be witnessed everywhere throughout this youngest sister of the Union. Children "grow" there, like Topsy, and lions are broken in to the plough. Nature has reversed herself in Oklahoma. The rattlesnake lies down with the prairie dog. The pig, no longer wallowing in his sty, has displaced the puppy and babe as a household pet. So marvellous is the fertility of that climate that cows produce four calves at a birth, thus recalling the children in the race to fill up the waste spaces now devoted to prairie dogs. And last, but by no means least, observe the triumph over nature: Oklahoma has evolved the lockless rifle!

A portable Dairy Lunch in Service near Opema

A Spirit in Prison*

A Novel

By Robert Hichens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER VII.—Continued.

HE was certain that he had come to her for some reason other than just to ask if she had need of him.

"It does the signorina good to get a breath of air before she goes to bed," Hermione added, after a moment of silence. "It makes her sleep."

"Si, signora."

He still stood calmly beside her, but now he looked at her with the odd directness which had been characteristic of him as a boy, and which he had not lost as a man.

"The signorina is getting quite big, signora," he said. "Have you noticed? Ter Dio! In Sicily, if the signorina was a Sicilian, the groomsmen would be asking to marry her."

"Ah, but, Gaspare, the signorina is not a Sicilian," she said. "She is English, you know, and English girls do not generally think of such things till they are much older than Sicilians."

"But, signora," said Gaspare, with the bluntness which in him was never rudeness, but merely the sincerity which he considered due to his padrona—dile also to his—*Me*, "my padrone was like a real Sicilian, and the signorina is his daughter. She must be like a Sicilian too, by force."

"Your padrone, yes, he was a real Sicilian," Hermione said, softly. "But, well, the signorina has much more English blood in her veins than Sicilian. She has only a little Sicilian blood."

"But the signorina thinks she is almost a Sicilian. She wishes to be a Sicilian."

"How do you know that, Gaspare?" she asked, smiling a little at his firmness and persistence.

"The signorina said so the other day to the groomsmen who had the cigarettes, signora. I talked to him, and he told me. He said the signorina had said to him that she was partly a Sicilian, and that he had said 'so,' that she was English. And when he said that—he said to me—the signorina was quite angry. He could see that she was angry by her face."

"I suppose that is the Sicilian blood, Gaspare. There is some in the signorina's veins, of course. And then, you know, both her father and I loved your country. I think the signorina must often long to see Sicily."

"Does she say so?" asked Gaspare, looking rather less calm.

"She has not lately. I think she is very happy here. Don't you?"

"Si, signora. But the signorina is growing up now, and she is a little Sicilian anyhow, signora."

He paused, looking steadily at his padrona.

"What is it, Gaspare? What do you want to say to me?"

"Signora, perhaps you will say it is not my business, but in my country we do not let girls go about by themselves after they are sixteen. We know it is far better not. Good?"

Hermione had some difficulty in not smiling. But she knew that if she smiled he might be offended. So she kept her countenance sad and said:

"What do you mean, Gaspare? The signorina is nearly always with me."

"No, signora. The signorina can go wherever she likes. She can speak to any one she pleases. She is free as a boy is free."

"Certainly she is free. I wish her to be free."

"Va bene, signora, va bene."

A cloud came over his face, and he moved as if to go. But Hermione stopped him.

"Wait a minute, Gaspare. I want you to understand. I like your care for the signorina. You know I trust you and depend on you more than on almost any one. But you must remember that I am English, and in England, you know, things in some ways are very different from what they are in Sicily. Any English girl would be allowed the freedom of the signorina."

"Why?"

"Why not? What harm does it do? The signorina does not go to Naples alone."

"Ter Dio!" he interrupted, in a tone almost of horror.

"Of course I should never allow that. But here on the island—why, what could happen to her here? Come, Gaspare, tell me what it is you are thinking of. You haven't told me yet. I know directly you came in that you had something you wanted to say. What is it?"

"I know it is not my business," he said. "And I should never speak to the signorina, but—"

"Well, Gaspare?"

"Signora, all sorts of people come here to the island—men from Naples. We do not know them. We cannot tell who they are. And they can all see the signorina. And they can even talk to her."

"The fishermen, you mean?"

"Any one who comes is a boat."

"Well, but scarcely any one ever comes but the fishermen. You know that?"

"Oh, it was all very well when the signorina was a little girl, a child, signora," he said, almost hotly. "But now it is different. It is quite different."

Suddenly Hermione understood. She remembered what Vere had said about Gaspare being jealous. He must certainly be thinking of the boy driver, of Rutile.

"You think the signorina oughtn't to talk to the fishermen?" she said.

"What do we know of the fishermen of Naples, signora? We are not Neapolitans, we are strangers here. We do not know their habits. We do not know what they think. They are different from us. If we were in Sicily, I am a Sicilian, I can tell. But when we come from Naples saying they are Sicilians, how can I tell whether they are truthful or not?"

Gaspare's inner thought stood revealed.

"I see, Gaspare," Hermione said, quietly. "You think I should not have let the signorina talk to that boy the other day. But I saw him myself, and I gave the signorina leave to take him some cigarettes. And he died for her. She told me all about it. She always tells me everything."

"I do not doubt the signorina," said Gaspare. "But I thought it was my duty to tell you what I thought, signora. Why should people come here saying they are of my country, saying they are Sicilians, and talking as the Neapolitans talk?"

Well, but at the time you didn't doubt that the boy was what he said he was, did you?"

"Signora, I did not know. I could not know. But since then I have been thinking."

"Well, Gaspare, you are quite right to tell me. I prefer that. I have much faith in you, and always shall have. But we must not say anything like this to the signorina. She would not understand what we meant."

"No, signora. The signorina is too good."

"She would not understand, and I think she would be hurt."

"Hermione used the word 'offend'—as you would be if you fancied I thought something strange about you."

"Si, signora."

"Good night, Gaspare. Buon riposo."

He moved towards the door. When he reached it he stopped and asked:

"I am going to bed, signora."

"Good night, signora. The signorina is still outside, I am sure."

"She goes out for a salame nearly every evening, Gaspare. She likes the air and to look at the sea."

"Si, signora. In a minute I shall go to bed. Buon riposo."

And he went out.

When he had gone Hermione remained at first where she was. But Gaspare had effectively changed her mood, had driven away that she chose to call her eyes, had concentrated all her thoughts on Vere. He had never before spoken like this about the child. It was a sudden waking up on his part to the fact that Vere was growing up to womanhood.

When he had gone Hermione remained at first where she was. But Gaspare had effectively changed her mood, had driven away that she chose to call her eyes, had concentrated all her thoughts on Vere. He had never before spoken like this about the child. It was a sudden waking up on his part to the fact that Vere was growing up to womanhood.

He was surely very unlikely.

She remembered that Gaspare had a jealous nature. His most of his countrymen.

Nevertheless, he had suddenly made the island seem different to her. She had thought of it as remote, as pleasantly far away from Naples, isolated in the quiet sea. But it was very easy to reach from Naples, and as Gaspare had said, what did they know, or understand, of the Neapolitans, they who were strangers in the land?

She wondered whether Vere was still outside. To-night she certainly enjoyed—Vere surely. Never till to-night had she

* P. 20 in HARRIS'S WEEKLY, No. 271. Copyright, 1907, by HARRIS & BROTHERS.

remembered that he was not his own master, not the owner of the boat. Of course he could not do what he liked. If he could—well, then he would have come back. She was positive of that.

If he ever did come back, she said to herself now, she would question him about the sea. She would get at him about the sea, at his feelings. She wondered if they could possibly be at all like hers. It was unlikely, she supposed. They two were as very different. And yet—

She smiled to herself again, imagining question and answer with Ruffo. He would not think her mad, even if she puzzled him. They understood each other. Even her mother had said that they seemed to be in sympathy. And that was true. Differences of rank need not, indeed cannot, destroy the magic chain if it exists, cannot prevent its links from being forged. She knew that her mother was in sympathy with Gaspare, and Gaspare with her mother. So there was no reason why she should not be in sympathy with Ruffo.

If he were here to-night she would begin at once to talk to him about the sea. But of course he would never come at night to the inlet.

Very knew that the Neapolitan fishermen usually keep each to his own special branch of the common profession. By this time of night he should Ruffo was in his home at the Margellina, sitting in the midst of his family, or was strolling with lively companions of his own age, or, perhaps, was fast asleep in bed.

Very felt that it would be horrible to go to bed on such a night, to shut herself in from the moon and the sea. The fishermen who slept in the shelter of the Saint's Pool were enviable. They had the stars above them, the waters about them, the gentle winds to caress them as they lay in the very midst of remembrance.

She wondered whether there were any boats in the Saint's Pool to-night. She had not been to see. A few steps and she could look over. She got up and went back to the bridge, treading softly because she was thinking of Ruffo. There was no moon, and looked down. She saw two boats on the far side of the Pool moored at the feet of the saint. The men in them must be lying down, for Vere could see only the boats, looking black, and filled with a confused blackness—of sails, probably, and sleeping men. The rest of the Pool was empty, part of it bright with the midlance of the moon, part of it shading away to the mysterious darkness of still water at night under the lee of cliffs.

For some time the girl stood watching. Just at that moment her active brain almost ceased to work, stilled by the reverie that is born of certain night visions. Without those motionless boats the Pool of the Saint would have been calm. With them, its stillness seemed almost joyfully profound. The hint of life bound in the coils of sleep, prisoner to rest, deepened Nature's impression and sent Vere into reverie. There were no trees here. No birds sang, for although it was the month of the nightingales none ever came to sing to San Francesco. No insects chirped or hummed. All was stark and almost fearfully still as in a world abandoned; and the light fell on the old fairs of the rocks faintly, as if it feared to show the ravages made in them by the storm of the long ages they had confronted and defied.

Vere had a sensation of sinking very slowly down into a gulf, as she stood there, not falling, but sinking, down into some world of quiet things, farther and farther down, leaving all the sounds of life far up in light above her. And descent was exquisite, easy, and natural and indeed inevitable. Nothing called her from below. For where she was going there were no voices. Yet she felt that at last there would be something to receive her; mystical stillness, mystical peace.

A silky sound—far off—checked that imaginative descent that seemed so physical. First nervously arrested it, then, always silky but growing louder, took her softly and softly back to the summit

she had left. Now she was conscious again of herself and of the night. She was listening. The sound that had broken her reverie was the gentle sweep of big-bladed oars through the calm sea. As she knew this she saw, away to the right, a black shadow shimmering under the moonlight beyond the inlet. It pushed its way to the water of her very feet, and chose that as its anchorage.

The figure of the rower stood up straight and black for a moment, looking bently in the night.

Vere could not see his face, but she knew at once that he was Ruffo. Her inclination was to lend down with the soft cry of "Pescatore!" which she had sent to him on the early morning of their meeting. She checked it, why she scarcely knew, in obedience to some imperious prompting of her nature. But she kept her eyes on him. And they were full of will. She was willing him not to be down in the bottom of the boat and sleep. She knew that he and his companions must have come to the Pool at that hour to rest. There were three other men in the boat. Two had been sitting on the gunwale of it, and now lay down. The third, who was in the bows, exchanged some words with the rower, who replied. Vere could hear the sound of their voices, but not what they said. The conversation continued for two or three minutes, while Ruffo was taking in the oars and trying them one on each side of the boat. When he had done this he stretched up his arms to their full length above his head, and a loud noise of a prolonged yawn came up to Vere, not nearly made her laugh. Long as it was it seemed to her to end abruptly. The arm dropped down.

She felt sure he had seen her watching, and stayed quite still, wondering what he was going to do. Perhaps he would talk to the other man. She found herself quickly hoping that he would not. That she was there ought to be their little secret.

All this that was passing through her mind was utterly foreign to any mystery. Vere had no more feeling of sex in regard to Ruffo than she would have had if she had been a boy herself. The sympathy which he felt with him was otherwise founded, deep down in mysteries beyond the mysteries of sex.

Again Ruffo and the man who had not been down spoke together. But the man did not look up to Vere. He must have looked if his attention had been drawn to the fact that she was there—a little spy upon the men of the sea, considering them from her position.

Ruffo had not told. She was glad.

Presently the man moved from his place in the bows. She saw him lift a leg to get over into the stern, treading carefully in order not to trample on his sleeping companions. Then his black figure went to shut up like a telescope. He had become one with the darkness in the boat, was no longer detached from it. Only Ruffo was still detached. Was he going to sleep, too?

A certain tremor came into Vere's body. She kept her eyes, which she had opened very wide, fixed upon the black figure. It remained standing. The head moved. His face was certainly looking up. She realized that he was not asleep, despite that yawn—that he would like to speak to her, to let her know that he knew she was there.

Perhaps he did not dare to—no, not that, perhaps fishermen's etiquette, already enshrined in his nature, did not permit him to come ashore. The boat was so close to the land that he could step out to it easily.

She leaned down, "Pescatore!"

It was scarcely more than a whisper. But the night was so intensely still that he heard it. Or, if not that, he felt it. His shadow—as it seemed in the shadow of the cliff—flitted out of the boat and disappeared.

He was coming—to have that talk about the sea.

To be continued.

NEW WOODS COMING INTO USE

THE scientific study of the merits of many species of trees against the use of which there has been a prejudice for one reason or the other is one of the most important phases of the forest work of the government, from an economic standpoint, and the investigations which have already been made have promised the lumber industry with much valuable information. The latest discoveries of valuable qualities in a former neglected species resulted after an investigation of the tupelo gum which finds its home in the Southern swamps. Experts say that the study has brought out no important data as the studies made on the loblolly pine, another species which was neglected for many years, but which is now put to valuable use for many purposes.

Tupelo, two years ago, at the time the study was begun, was little known and seldom used even in the sections of the country where it is most plentiful. In the logging off of cypress in the Gulf States, where tupelo is found in large quantities, the trees were entirely disregarded. It was found that the prejudice then existing against the wood was caused by a lack of knowledge of its properties and lack of care in handling the material. The investigations have been carried on by the United States Forest Service and have proved the value of the wood for a number of

uses. The result of these studies removed, very largely, the existing prejudices against this gum, and in a short time the demand for tupelo rapidly increased.

This wood is now widely used, not only in the State where it grows, but also in distant sections of the country, in the manufacture of wooden shingles, sounding boards for violins and organs, mantels, and interior finishing, such as moulding, door and window frames, and door joints. It is manufactured into all kinds of lumber, including a good grade of edge grain flooring. Tupelo gum, in the form of flooring, was recently found competing successfully with Douglas Fir in the Los Angeles market, even though bearing a freight rate of eighty-five cents a hundred-weight from its source of production in Louisiana.

This is only one example of the studies carried on by the government for the purpose of creating markets and establishing uses for the kinds of wood whose properties are not understood. The reason for making these studies is that, by finding substitutes for woods now in use which have grown scarce in consequence of an excessive demand, the timber supply of the country is in effect increased, the most economical use of wood is promoted, and the evils of a general shortage in wood supply, which is rapidly becoming a national problem of the first magnitude, are to that degree lessened.

Nevada's Safeguard for Mine-buyers

By SAM P. DAVIS

Chairman of the Publicity and Industrial Commission of Nevada

ANYVILLOIS as the recent development of Nevada's mines has been, the good name of the State has suffered much from the swindling operations of dealers in illicit mines. This evil has now been abated, practically eliminated, and hereafter there will be no excuse for the investor who allows himself to be deceived by mine sharks.

The last session of the Legislature established a Publicity and Industrial Commission, and in a short time this commission will be able to issue a public bulletin which will in a great measure segregate the wildcats from the legitimate mining enterprises. This commission will also act in conjunction with the Mining and Scientific Society of Goldfield, composed of mining engineers who hold diplomas from recognized schools of mining. This organization has agreed to operate

The original Mining Stock Exchange in Goldfield

with the Publicity Commission, and will answer all inquiries made relative to the status of any mining enterprise in Nevada, and inform the inquirer whether it is a legitimate mining enterprise, handled by reputable promoters, or a capitalized sand-bank manipulated by rascals who put the proceeds of stock sales in their pockets instead of applying them to actual developments. A mere inquiry on the status of any property whose stock is on the market will be answered by the secretary of the Publicity Commission at Carson City, without charge, or referred for more explicit information to Forrest Nevers, Secretary of the Mining and Scientific Society at Goldfield. When it is necessary for the experts of the society to visit and examine the property and make an experts' report an expense fee will be charged. The information thus secured will be absolutely reliable, as the Organization of Mining Engineers, whose headquarters are at Goldfield, embraces every mining engineer of standing in the State, and has the official endorsement of the State Board of Publicity.

The history of the newest discoveries of gold in Nevada is as luminous as the history of the earliest finds of precious metal was tragic. The thousands who swarmed across the continent in the first rush for California's gold-fields paid no heed to the prospects in Nevada, whose rugged Sierras were simply so many barriers in the way. The great "Washoe rush" of 1858, so graphically described and illustrated in HARRIS'S MAGAZINE by J. Ross Brown, resulted in the development of the Comstock Lode which added six hundred millions of dollars to the wealth of the world. Nevada, growing in importance from her mineral discoveries, came into the Union in the darkest days of the Civil War.

The story of the rise and supremacy of the Comstock, the story that it held over the politics of the West, and its product of over six hundred millions, most of which went to build up San Francisco, is a three-fold tale, and only incidental to the purpose of this article, which deals with the new Nevada. When the search for wealth went below the three-thousand-foot level, the added expense of keeping the mines clear of water made the work less profitable, and the demonetization of silver dealt a heavy blow to the mining industry of the world. Then followed a period of terrible depression to the State. Rats and snakes took possession of the discouraged mining works, and creeping vices awoke their shrouds about the inert machinery. Nevada went rapidly back in wealth and population, and there was even talk of sending from the wilderness of States the desert-born girl who had saved Uncle Sam's lonely a few years before from possible annihilation and bankruptcy.

But chance, which has always played an important part in the destinies of the State, came back to us on whitened wings when Jim Butler discovered gold in Tonopah. He threw a splash of rock at a refractory mule in a fit of anger, and the stone, after

bounding from the flank of the animal, fell at his feet. He picked it up, it threw again, and, its weight attracting his attention, concluded he had hit the mule enough and placed the piece of rock in his pocket for future reference. A week later he asked an assayer to determine its value, and added that he lacked the dollar and a half to pay for the assay. The assayer replied that as soon as he found anything of value in the rock he would let him know, and pitched it out of the window as soon as Butler was out of sight. It lay there eight months, when another miner picked it up, and, attracted by its appearance, had it assayed by the same man who had previously thrown it away.

This discarded piece of mineral showed an assay value of eight thousand dollars to the ton. Think of it, if you run thick of it lately, of the pranks which chance plays with the mining industry! Had Jim Butler missed that mule, or had the rock, after hitting the animal, not bounded back just where it did, neither Tonopah, Goldfield, Bullfrog, Rhyolite, nor a dozen other prosperous camps of southern Nevada might ever have been discovered. Over a hundred millions staked on a single throw!

Butler and the miner who paid for the assay went into partnership, and, finding the place from which the chunk came, located over a hundred claims, and leased them out on a royalty of twenty-five per cent. The leases were all verbal, and ran to the first of the following January, nearly a year. Some of these leases barely paid expenses and some made inadequate fortunes for their owners. Half a dozen of these leases proved so profitable that one thousand per day rental was offered for renewals as the time approached to give them up. Butler declined to extend the contracts, and at midnight on the last of January all work ceased at the stroke of the clock in Jim Butler's cabin.

By prearranged arrangement, as the clock struck, Butler discharged a six-shooter in the air, and the busy hundreds of miners, working like beads to get out every pound of the precious metal possible, dropped their tools at the sound of Butler's shot as if they had been stricken with paralysis. It is said that out of the hundreds of men, some of whom were taking eight thousand dollars' worth of gold per day from their leases, not one of them ventured to touch another ounce of the precious metal after the sound of Butler's weapon signalled the stroke of midnight. Such was a miner's word and a miner's honor in Nevada.

From this beginning sprang one of the great new mining camps of the West, which has now cast off its swaddling clothes and is regarded as a permanent proposition. There is enough ore in sight in the Mirak above to last for twenty years, it is an odd thing to note, however, what vast attention this tremendous discovery attracted in San Francisco. The queen city of the Pacific had been built up by the mining industries of California and Nevada, yet when miners came to San Francisco from southern Nevada to secure rapid in develop their claims they were met with but cold regard. Men who had made their millions from Nevada mining saw specimens of ore blistered with gold and remarked: "Pretty good rock, but too far from the Comstock." This is a mere-erae the past glories of the Comstock hung as a banner over the future prospects of the new find, because the Comstock had been so great in its day that many people could not disabuse their minds of the idea that there would never be

Bolls and Beas on the Corb at Goldfield

anything in mining to equal it. But the staid Philadelphia capitalists, when presented with an opportunity to invest, put their capital in bonds and reaped a golden harvest.

Tonopah had other drawbacks at the beginning of its career. Nearly every mining expert of our era who inspected the formation turned the discoveries down and made adverse reports. While the experts were discounting the finds, the miners kept right on sinking their shafts and taking out the stuff. Some Eastern

men came out to Tonopah, and, finding all claims in the vicinity of the original discovery taken up, went some distance outside of what was considered the mineral zone and sunk shafts. The old-timers thought it was a case of the quick parting of fools and their money, but the "boos" who knew nothing about mining struck it rich as soon as they dug deep enough and got substantial returns on their investments.

One Irish miner who had a claim for sale was asked, "Does the ledge go down?" "I'm dead sure it don't go up," was the reply. This raised a laugh that resulted in the purchase of the property, which could not now be acquired for less than five millions.

The camp of Goldfield, which is not yet three years old, is another example of the magical growth of a new city. It lies twenty-

The Montezuma Club at Goldfield, where the *Jaquiter* made \$100,000 by taking tips from the Conversation of Members

five miles to the south of Tonopah in the hollow formed by the center of an extinct volcano. The merest novice in geology can recognize its origin in a glance at the massive walls of the crater which surround the town. Like Tonopah, it suffered from the adverse opinions of the experts, but miners' muscle and miners' grit demonstrated the value. Less than three years ago a few hints marked the beginning of what is now a city of twenty thousand inhabitants. Substantial stone and brick buildings are going up; banks with millions of ready capital, modern hotels, rise, mark the progress of development. In the latter part of July the celebration of the new Montezuma Club, a social organization, was held by moonlight. The building will cost fifty thousand dollars. Music, speeches, inspiring ceremonies, and elegantly gowned women graced the occasion. Ladies' night in the old Montezuma Club would astonish a New Yorker. He would pause in wonderment at the beauty and fashion in evidence. Many of the cleverest people of the country have been drawn to this vortex of money-making.

Needling in a volcano's crater, people lead a fantastic existence. The place is a very turmoil of speculation. Last winter in the midst of the stock excitement brokers and stocks to people in the street from the third-story windows of their offices. Our New Yorker made two hundred and fifty thousand dollars in twenty-four hours. Some of the boldest plungers in the game are women. It is related that a young lady for want of a better place had to sleep on the counter of a drygoods store with some bolts of cloth as a pillow.

"Oh, I didn't mind the hard bed," she said next day, "for I made over three hundred dollars in stocks." An old man with a pretty daughter who came in with the rush was obliged to occupy two chairs in a gambling saloon. A couple of miners who saw the young lady's plight gave her the key to their cabin. This is the real chivalry of the desert. All women are equally well treated and protected in a Nevada mining camp. Inside a year from the discovery a railroad was running in. I came in on a Pullman sleeper. Stopping at a stand to get my boots blacked, I found one man working where there were two chairs.

"Where's your partner?" I asked, as I took a seat.

"Oh, he's just run down the street to lay a mine; he'll be back in a few minutes."

After getting down off the stand I noticed that he had not devoted attention to the heels, and took him to task for it.

"You can't expect me to bother with the heels, sah, for a quarter."

Later I learned that an interest in a mining lease had netted him a hundred a day, and success had made him indifferent to the profits of the shoe industry. The *Jaquiter* of the Montezuma Club, a venerable old dork, had managed to accumulate over a hundred thousand dollars by listening to conversations in the club and governing his investments accordingly.

Gold-seeking has thrown together a decidedly mixed population from all over the world. The honest leeches are there—lawyers, stockeers, orators, men of letters who could talk Greek and Latin, adventurers, soldiers of fortune, gamblers and sharpers, all mingled in the same swirling vortex. Nearly every man who has been successful owns an auto, and these greyhounds of the desert have been a tremendous factor in the development of the country. In the old days, to inspect a mine meant a long and tedious ride over the

hot sands on jaded horses, with lack of water and many other discomforts. Now an investor has but to drop into the waiting automobile, and a few hours' speeding over the waste lands him at the scene of a new discovery one hundred miles away, and if he is pressed for time he can return the same day. A new pattern of automobile built especially for desert travel is being manufactured at Goldfield. It is long and low, designed for high speed and rough work. These cars seldom break down, and crossing a twenty-mile stretch of sand on a moonlight night in one of these machines, where the going is as level as a billiard table and as easily as land, is a most exhilarating experience.

Every newcomer to a Nevada mining camp is met with a most sincere and hearty greeting. Conventionalities are put on the shelf, and the late arrival soon realizes that he is one of a big family. Settle down, the orator, announces that he is going to spend his last days in the atmosphere of the desert.

"Everybody here calls me Nate," he says, "and they all mean it. I'd rather be called Nate out here in Nevada than Sir Nathaniel on Pecosville."

A lady who had mingled all her life in the fashionable society of the East said to me: "I have just begun to enjoy the real freedom of living. I haven't got to call up Mrs. Grundy every time I turn around. The pure air, the glorious skies, the weird landscapes, the jolly people and odd characters I meet are all most interesting studies in humanity, but the nicest thing of all is that all my good friends here call me 'fine.' If people in New York had addressed me so familiarly, such cheer or confidence I would almost have fainted, but here it seems just the thing."

But these social conditions do not make mining camps. In order to inspire the confidence of the investing and speculative public, tonnage and dividends are necessary. The following is compiled from the official record of Goldfield as far as obtainable:

	Tonnage	Value
June.....	103,560	\$1,325,405
July.....	16,960	2,146,253

Since these figures were compiled a strike has been made in the consolidated properties owned by Nixon and Wingfield, and conservative experts estimate the value to be fifty million dollars if the ledges extend another hundred feet down. During the first week of August Bernard Baruch and his associates who represent English and French capital accepted consolidated stock in payment of a loan of one million dollars which they had advanced for the development of the mines. They also took an option at \$7.75 per share on the stock paying over a million down, and the taking up of the option will involve an expenditure of six and a half millions. A little over a year ago this stock was considered so worthless that a miner swapped some of it for a horse in Reno. The owner of the horse would not take all stock, but insisted on ten dollars in cash out of the total value of \$75.

The town of Tonopah has settled down to be a regular million producer, and is now yielding at the rate of over a million a month in dividends. Other camps throughout the State are coming to the front at the same time and becoming regular shippers of ore. Bullfrog, Rhyolite, Greenwater, Fairview, Ramsey, Seven Trenches, Elly (with its millions of copper in sight), Ollinghouse Canyon, Florist (with its square miles of placer gold), and the Ironwood Canyon copper ledges east of Carson City give promise that Nevada this

A Stormy Day in Goldfield during one of the Winter Blizzards which sweep over the Desert

year will more than make good the estimate of the mint director that Nevada would produce fifteen millions in 1907.

Goldfield alone will produce twenty millions and Tonopah twelve millions, and the other new camps will get in line as soon as they can secure the proper shipping and milling facilities. The country is being so well stocked with men and money that the laws of population and new business conditions. Yet in spite of this hundreds of thousands of tons of low-grade ore have accumulated on the dumps, and thousands of tons of freight have been piled at the way stations. Mining engineers are constantly experimenting to secure processes by which low-grade ore can be successfully treated to meet the conditions caused by high freight rates.

The Millions at Tonopah

By DONALD B. GILLIES

NEVADA'S mineral greatness was long ago established. The performances of this Sagebrush State when the Comstock mines were startling the world with their marvelous productions are fresh in the memory of many, and those who are of the younger school have heard of the production of the \$400,000,000 from those world-famous mines. The record still stands, but who knows for how long? Comstock, with a production of \$400,000,000; Eureka, \$100,000,000; Austin, \$34,000,000; Candelaria, \$20,000,000; Belmont, \$9,000,000, and many others of lesser importance, are particularly bright stars in the mining horizon, whose individual performances have never been surpassed. New stars are appearing—Tonopah, Goldfield, Bullfrog, Fairview (and many others), and simultaneously with them you hear of the "Miraph" mine, the "Mohawk," the "Montgomery Shoshone," Fairview—all youngsters to-day, but with records when compared in value since their discovery that surpass Virginia City, Butte, Cripple Creek, Leadville, etc., many times over.

Much has been written in praise of Nevada's great mineral production in the past. Today speaks for itself, and to-morrow are equally bright. Praise and criticism of every new camp that comes to the front in this desert State go hand in hand. Tonopah has had her tributes and adverse criticisms, and it is my desire to write a few facts concerning this great shining camp since its discovery—of its past record, and what it is doing to-day.

Tonopah, the parent camp of the Nevada, was discovered May 19, 1900, by "Jim" Butler (and his burro), and I will pause here only long enough to doff my hat in silence to the Father of this great camp, and stand uncovered while his burro sounds the morning call.

Three mountains—Oddie, Butler, and Brangler—partly enclose Tonopah; the first discovery of ore was made at the foot of the west slope of Oddie. The first assays ran in the neighborhood of \$600.

On August 23, 1900, the first recorded locations were made, covering the Miraph ledge. Following this location many others were made, notably the Montana, Tonopah, Fairview, Tonopah Extension, North Star, Belmont, and West End. These were blind locations, as the veins did not outcrop or apex at the surface.

With the exception of the Miraph, as above mentioned, no other veins outcropped or apexed at the surface in the district; but the cuppages were covered by a capping (later andesite) varying in thickness from 100 to 1100 feet (proven), so that it was necessary to sink through this capping into the earlier andesite, or ledge-bearing porphyry, before one could expect to find ore, as only in the ledge-bearing porphyry have the more important ore bodies been found. The Belmont-Tonopah was the first mine in the district to prove this fact, and was afterwards followed by the Tonopah Extension, Midway, and all others in the district. It was during this period of development work, when this capping was being sunk through, that some of our best mines of to-day were spoken and written of as "cellars." This development proved three facts: that the more important ore bodies were only found in the earlier andesite, and that wherever the earlier andesite was found, and crosscutting pursued, magnificent ore bodies were found. In the camp to-day, where a shaft has passed through the capping (later andesite) into ledge porphyry (earlier andesite) it is considered just as significant as the finding of ore, for, wherever the ledge-bearing porphyry has been explored to any extent, veins and ore bodies have been encountered.

The depth of the shafts in the producing mines varies from 500 to 1100 feet, and the latter in camp was developed in course of company (excepting the Miraph) sinking through from 100 feet to 400 feet of rapping before reaching the ore horizon or ledge porphyry.

It is true that some companies have been organized and commenced operations in this district without the necessary funds to carry them through the capping. Other companies have so located their shafts that any amount of reasonable sinking would not

bring them into the ledge porphyry, for the reason that the same were located in volcanic necks. Suffice to say that where the development work has been conducted along lines and contrary to the geological facts, success has attended every venture in the district. Too much credit cannot be given to the pioneers of this region who made it possible to accumulate the geological data which to-day direct our course of development.

The ore veins and formation in general closely resemble those of the Comstock district. Mr. J. E. Spurr, who has given to us a wonderful geological work on this district, has not designated the veins of the locality as true fissures, but calls them veins of replacement, in which the ore deposits have been formed along certain well-defined shear zones. While this is technically true, yet they have all the characteristics of true fissure veins, and in many cases it is impossible to put them in any other class.

The veins being worked to-day in the Tonopah district are large (10 to 40 feet wide), well defined (having been developed for over a mile on the strike), and will average in value higher than those of any other district in the United States. Faulting has more or less affected the ore bodies, but has not to date been detrimental to them. Intrusions (rhyolite and rhyolite dactite) of the younger series (temporarily speaking) of volcanics in this district have in places interrupted the ore bodies, and to-day the very important work of "proving up" the ore bodies underneath the intrusion of rhyolite dactite la is progress in two or more mines in the camp.

Ledge porphyry similar to that above the intrusion has been found underneath it, and in the humble judgment the same ore bodies in character and value will be found underneath the intrusion as exist above.

While the camp of Tonopah is but six years old, it has shipped 396,000 tons, with a gross valuation of \$17,395,000. There are on the milling dumps in the Tonopah district 143,000 tons of milling ore of a grade of \$20 per ton, or a gross value of \$2,860,000. It is interesting to know that out of \$17,395,000 worth of ore sent to the market from this district, the railroads and smelters have received \$6,248,000, and the mining companies only \$11,347,000. This explains why on the dumps of Tonopah to-day there is \$2,860,000 worth of ore which, on account of the existing marketing rates, it is impossible to ship. This evil, however, is about to be remedied, for in this district are at present four milling plants operating successfully, and two more under consideration. So that all grades of ore can be treated with great profit at home. In another year but little ore will be shipped to the smelters, which are 750 miles distant, thereby saving freight charges of from \$7 to \$17 per ton, and the rolling cost will be less than half the existing smelting charge.

The mines of Tonopah in the past have been worked exclusively for the higher grade ores (from \$24 upward), as such ores only could stand the very high freight and smelting charges. This made the cost of mining necessarily very high and did the mines a great injustice. With the advent of the successful milling operations, the entire width of the vein from wall to wall is being worked, greatly reducing the mining costs; and the great saving effected from milling increases materially the earning capacity of the mines so doing. Our greatest mining camps to-day are those which produce a rolling grade of ore in great quantities. Tonopah, with her mills in operation, can produce great quantities and of a good grade.

Tonopah has a population of 6500 persons; four banks, with a total capitalization of \$1,250,000, and \$3,200,000 on deposit; has an assessed valuation of \$1,800,000; and has paid in dividends \$4,100,000. The wages paid are the highest in the country. The relation between employer and employee are most cordial; there never have been any labor trouble or disturbance of any kind, and it is no mining camp in the country can you find a superior class of miners to those in Tonopah.

A camp of six years that has produced \$17,395,000, paid in dividends \$4,100,000, and expended in improvement and construction \$1,800,000, and has a population of 6500 persons, and it is true, as this is, still a greater record will be made in the years to follow.

Cobalt, a City of Silver

By MARC M. REYNOLDS

SILVER has been found in vast amounts in Cobalt, some 300 miles north of Toronto, on the Temiskaming and Northern Ontario Railway, and a wild stampede has been for some time in progress.

The first mine to be discovered in the Cobalt district was the La Rose, and to-day bears the name of the discoverer. La Rose was a poor blacksmith in the employment of the railway in course of construction during the year 1901 from North Bay, Ontario, toward Hudson Bay. La Rose was waiting for a blast, and just as the explosion occurred a piece of rock fell at his feet from the hillside. After the usual incidental delays, the ore was assayed and showed great silver values. As a result of this, the La Rose mine discovery became known as a rock began. During 1903-04 the stampede was at its height, and the news was exploited that Cobalt was

the richest silver camp in the world. In 1904 there were four shipping mines—La Rose, Tretheway, Nipissing, and St-Kinley. The output was 120 tons of ore, valued at a little over \$120,000.

In 1905 additional mines—the Kerr Lake Mining Company, Victoria Mining Company, Buffalo Mining Company, Lawson, White Silver Company, University, Watts, Temiskaming & Hudson Bay, Valdez, Drummond, and others—were discovered and valued at nearly one and a half million dollars. The total output of all mines, old and new, in 1906, was 5120 tons, valued at \$5,100,000. Cobalt now contains some 5000 inhabitants, and is the usual type of mining town, but very orderly, since the provincial law forbids the use of intoxicants in the district. This character (Cobalt) nickel, and copper have also been found, and the development of the district is proceeding at a rapid rate.

HOW GOLDFIELD GUARDS HER TREASURE

Bullfrog and its Suburbs

By FRANK P. MANNIX

Editor of *The Bullfrog Miner*

THAT portion of Nye County, Nevada, known as the Bullfrog mining district was nothing but a barren desert of shifting sands and unnamed rocks toward the end of the year 1904. To-day it contains more than one hundred mines and prospects upon which active work is being done, and five stamp mills with a capacity aggregating 500 tons daily are being installed, most of which will be running by October 1. The district has two modern cities equipped with electric light plants, water systems, ice factories, and all the equipment of civilization.

These towns, Liklydite, with a population of between 4000 and 5000, and Beatty, with a population of about 1000, are four miles apart, and have two railroads each, while a third will be completed to Liklydite within the next thirty days. The Western Union Telegraph Company has had offices in the district since its first settlement, and the Postal Telegraph Company is in the field, announcing that it will establish its state headquarters at Liklydite. A system of telephone lines was installed at an early date, and branch lines to the outlying camps are being added nearly every week.

The last reliable reports from the mines and prospects show an aggregate of more than 100,000 feet, or twenty miles, of development work. In fact, the Bullfrog claims to be the second district of the State and a formidable competitor for first place in Nevada mining. Tonopah was the first discovery, with Goldfield second, and Bullfrog third. But the advocates of the last named town say that "the last shall be first", and they fix the time at an early date for the fulfillment of the prophecy.

The Bullfrog, like most mining camps, has its romantic story of discovery. Early in the month of August, 1904, "Shorty" Harris, whose Christian name has been lost in the sickening custom which obtain among miners, came to the conclusion that everything of value had been staked in the Tonopah and Goldfield districts and packed his horses and started out with Bullfrog, California, his objective point of destination. He was travelling along the Amargosa Desert, about seventy-five miles to the south from Goldfield, when he came upon Edward Cross, a stunted prospector, and the two camped for the night at Buck Springs, where a small amount of water seeps out from the side of a mountain.

An outcropping of rock 3000 feet away had previously attracted Harris's attention, and the following morning, while waiting for Cross to recuperate for the journey, he climbed up a declivity and broke off a piece of the formation. It showed free gold, and so soon as Cross was able to travel the prospector secured other specimens and returned to Goldfield. Assays showed 7000 oz. gold to the ton and a stampede immediately followed. The entire country proved to be highly mineralized, and some of the best mines of the State have been developed there.

The naming of the district came from one of those characteristic small incidents common to mining life. A bullfrog never croaked within hundreds of miles of its boundaries, and it is only since the district has been established that that portion of the animal which is estate has found its way into camp in a refrigerator car, but the predominating color of the rocks are found in the district is an alternate dark and green, which is well defined in every specimen. A lump of the formation comparative in size and shape with the animal very much resembles a bullfrog. When Harris and Cross were debating a name for the new camp a lump of ore was tipped over and it rolled down by the side of Harris. It so much resembled a bullfrog that the new district was then and there given the name.

The development of the district has been rapid and permanent. Every hill and mountain within an area of 400 square miles of the discovery proved to be mineral bearing, was staked, and is now being developed and mined.

New discoveries are being frequently made on the outskirts of

the district, whose boundaries are being gradually extended. There are already numerous, and their number is being increased every few weeks. Scarcely a month has elapsed since the achievement of Harris and Cross, in which other discoveries have not been made, and a rush followed. In nearly all cases the finds have proved substantial.

Notably among the later discoveries are Greenwater, Lev, Echo, Schwab, Skidoo, Harrisburg, and other established camps, while other camps are being constantly formed.

Greenwater, Lev, and Skidoo have already become known abroad in a substantial way, and are forging to the front with mines that are giving them a more substantial reputation with every strike of the pick.

Lev is the nearest of them to the Bullfrog. Only a narrow strip of the Amargosa Desert intervenes between their boundary lines. The Lev Bonanza on the Nevada side of this district is the nucleus of a cluster of mineral deposits in the Bonanza Mountain which is giving proof of what development will do.

Across the line on the California side is the Baywood, whose high-grade ore has already spread the reputation of the district abroad. Twenty or thirty other mines and prospects in its neighborhood are being worked and developed, with good results in every case.

While neither the Bullfrog nor its younger neighbors have produced such high-grade ore as other districts in Nevada, yet they possess advantages over others in point of area of paying gold.

This is especially the case with the Bullfrog. It is many times the area of Goldfield and Tonopah combined, and has better transportation facilities. Its mining zone contains incalculable deposits of low and medium grade ore, with many lenses and sheets of high grade. The great outcry which has been raised against the new Nevada mines, to the effect that their deposits are without depth, has no foundation here. Her massive ledges bearing rich gold values come near the surface, it is true, but they have grown in wealth and width as they have been developed. Depth in every instance has demonstrated an increase in values and bulk.

Property owners are not afraid, but are eager to uncover their holdings, and every dollar of that can be obtained is being devoted to this work. Instead of having five or six mines upon which to sustain the district, as is the case in many instances, every well-informed citizen and miner expects to see within the next few years more than one hundred mines in the Bullfrog district that pay dividends.

The deepest mines in the district—though no great depth has yet been reached—are proving the existence of sulphide under the rhyolite. The predominating vein matter is quartz and talc, often stained with iron, or changed near the surface to a more or less heavy manganese. Rhyolite almost invariably constitutes the rock at the present levels. Where a depth of 400 feet or more has been reached the rhyolite has given place to porphyry, and free gold has often been found in porphyry dikes.

The lack of transportation facilities and congested conditions of manufacturing have retarded the introduction of mills and machinery into the district, but despite all obstacles the Montgomery Shoshone, Home-take King, Gold Bar, Keane Wonder, and Gold Bullfrog have almost completed mills, and will all be pounding ore in the early part of the coming fall. The Montgomery Shoshone expects to be running its combination mill of 300-ton capacity in September 1. The Home-take King will begin with twenty stamps. The Gold Bar will begin with one hundred stamps, the Keane Wonder with 600; and the Gold Bullfrog will try a new process. All intend to increase their capacity as rapidly as machinery can be secured and installed.

But this is only introductory. Gigantic water systems and electric power plants costing millions of dollars are being installed to supply the hundreds of mills that are contemplated for this portion of Nevada, which will be built as soon as money, transportation

Frank ("Shorty") Harris, the Discoverer of the Bullfrog District

facilities, and factories can do their part. Water pipes are being strung along the desert, and down the mountainsides for miles and miles, pipes for wires which are to supply electric power are being installed along the same rights of way; wagon roads, autoways, and railroad spurs are being extended in every direction. The general activity that prevails here is possibly unparalleled outside of Nevada desert mining.

This is doubtless due to the recent improvement in transportation facilities. In the month of October a year ago the first railroad, the Las Vegas and Tonopah, reached the district. It gave connection with the outside world through Salt Lake City and Los Angeles. The second road, the Goldfield and Bullfrog, reached the district only recently, connecting it with the Southern Pacific system at Brea by way of Goldfield and Tonopah. This has also given connection with the machine shops and foundries both east and west, and established a competition for Nevada patronage which has not proved disadvantageous to the mining interests.

The arrival of a new railroad this summer and the rapid strides across the desert of the nearly completed "Borax" South line from the Santa Fe on the south, has also opened the operating route to the westward, and has in a measure relieved the congested condition of transportation.

The arrival of the third road will be a further relief in this connection, and with the summer run, the foundry and machine shops have been enabled to fill most of the orders. In view of these facts the activity this fall is expected to surpass anything so far done in the way of development and improvement.

During the past summer stocks have been dull. Many companies have practically closed their doors, but, without exception, bankers expect an early revival and a great full trade. They reason that if conditions were so good before such wholesale development began they ought now to improve in proportion. All manner of business is confident and prosperous. There is not an instance of failure. Millionaires have increased their fortunes, and men who went there in debt have become millionaires. The country has afforded the greatest opportunities in the world, and they are still increasing, though competition is greater. A steady flow of immigrants is pouring in.

Besides mining and the other businesses incident thereto, all which are prosperous, there are great possibilities in other lines in

this country. No attention, as yet, has been given truck farming, gardening, dairying, or fruit raising. Of course the land is a desert. But water is being brought from abroad for mining and domestic purposes, and it may be secured in ample quantities to supply the needs of husbandmen. The soil is rich and only needs water to make it produce anything that grows. But little effort has been made to secure water by boring or digging, though a few wells have been sunk, and it has been found at different depths. It is possible that at many points on the Amargosa desert water may be found at reasonable depths in sufficient quantities to supply large areas for gardening and agricultural purposes.

People are already beginning to investigate, and the high prices which they have to pay for all manner of produce of this kind gives them an idea of the profits that may be made by tillage of the soil. At present a stampede is being made toward a portion of Death Valley, a distance of thirty miles from Khyolite, where it is reported that a prospector has discovered pure water, pure and in large quantities, a few feet below a surface covered with bunchgrass. This discovery is claimed to be more valuable than a gold mine. It is said that over an area of many miles water is to be found just under the surface, so that it can be easily turned to irrigation uses. If this is true, a great agricultural district can be brought into existence. The soil and climate would produce everything in the way of vegetation. Men are engaged in staking and locating the country under the Desert Act with the same eagerness which they devote to the staking out of valuable or promising gold claims.

The social and moral conditions of the Bullfrog district are good. The towns do not bear the stamp of the old time mining camp. As before stated the towns are modern in every particular; they have splendid business edifices, many of them being built of stone and costing more than \$50,000. Real residences are also a feature. Most school buildings are the first things planned in the location of a Nevada town. Churches are liberally patronized and different denominations already have met edifices in which to worship.

The man who seeks his fortune in the southern Nevada mining camp, and expects the Bullfrog, will find, in addition to the greatest opportunities on earth, a homelike place with chances for every advancement in commercial and social life.

Bill Brun, one of the Discoverers of the Lee-Echo District, twenty-five miles south of Bullfrog

THE ALAMOS DISTRICT OF MEXICO

ESTABLISHED in the foothills on the west side of the Sierras, in Sonora, Mexico, is the old city of Alamos, the gray walls of which have reflected the sunshine of over two hundred years. The quiet life of Alamos has been touched by the modern magic of railroad transportation, and a district known for two centuries as one of Mexico's richest mining regions is now, under the new conditions, pouring out a wealth of silver, copper, and gold. Riding into Alamos through orange-groves and fertile valley lands, the scenery suddenly changes. Rugged hills and fertile orange groves replace the green level lands of the Mayo River valley, and you ride out of the agricultural into the mineral zone.

What a romance of millions these hills could tell if tunnels and shafts were endowed with the gift of speech! In 1804 Humboldt rode into Alamos on his tour of scientific investigation of Mexico's mineral resources. In the footnotes of his book he states that at the gates of this city he passed a caravan of a thousand mules laden with silver bars from the Quintana Mine. This mine is still producing, and is now the deepest mine in the state of Sonora. According to the prefect of Alamos, F. A. Salido, the Quintana has averaged a million dollars a year for a century.

Alamos is one of the smallest little cities in the world. It has a population of six thousand, with schools, church, and hospital. Its riches have been legendary year in and year out by the production of its principal mines—the Quintana, Frimontorin, Santa Dominga, and Minas Nuevas, all located on the great silver ledge which has a record of production of several hundred million dollars.

Strange tales of extravagance of mine-made millionaires, of

fabulous finds, and of still richer are bodies in the deepest workings add to the interest of this district. A story is told of one of the rich mine owners of the old days in Alamos, Señor Almada, who gave a public feast in celebration of the baptism of his first grandson. He turned the great well, located in the plaza, into a fountain of wine by pouring into it a hundred kegs of claret, ten barrels of brandy, and a hundred casks of sugar. The entire populace were then invited to refresh themselves at this wonderful well, after which in a long procession they marched across the plaza to the cathedral, where one hundred and seven years old, over a pavement of solid silver bars, which the rich old miner had caused to be laid from his street mansion.

Dwight K. Woodbridge, M.E., in a recent article on Mexico says: "From west coast districts, like Alamos, there are still to be traced deep-worn trails over the Sierra, leading a thousand and more miles to Mexico City, through which ran the streams of produce that lured the shores of Mexico and Spain, and brought to the latter its height of envying wealth and imperial prosperity. Under heavy guard, month after month, year following year, there traversed the western mountains the great caravans consisting of hundreds of mules, each laden with a cargo of gold and silver bars."

The led, which has made Alamos famous is a great contact between granite and porphyry, which can be traced across the mountains for over forty miles. The famous mines previously mentioned, together with the Zambora, Balvanera, and La Perla, are all on this great vein or contact, and comprise the latter, which is a recent discovery, are all famous old producers. Ruins as old apparently as the Aztec civilization are found in these hills, not infrequently in mines supposed to be new discoveries.

THE GOLDEN LURE

DRAWN BY FRANK TENNEY JOHNSON

Rock-Drilling For a Miners' Prize

By CONNER MALOTT

sport sets a Western mining-camp abode like the annual rock-drilling contests between the champions of rival mines. All work is suspended, while the miners, trudging in from the mountains for miles around, assemble in enthusiastic groups to "root" for their own team. The mine managers come with their young wives to witness these truly titanic contests, and in their charming white dresses the women cheer on the brawny heroes of the "Fidelity Flows" or the "Hell-to-Pay" Company, as the case may be, to victory.

There is always betting, and the gambling spirit is fostered by the fact that the best team does not always win. Though the drills are sharpened by the mine blacksmith with all the skill he can muster, there is always a chance of an overlopped steel seeking its doom deep in the granite hole; and then the un-

On the Left is Nygren, one of the Winners, holding the Drill, while his Partner, "Cash" Patterson, is pounding it into the Ground at the rate of more than Two Inches a Minute. The Man with the Coat in the Foreground is a Coach who Regulates the Supply of Water from a Bucket to the Drill Hole

lucky team, taking a fresh "bit," must literally crush that broken section into fragments before the demolished steel can be worked out of the way and the sinking of the hole be renewed.

The rock itself is a huge basaltic of granite from the quarry famous for producing the hardest in the district, and it is brought down from some far-off region, miles away, at considerable expense. Usually the scene of the contest is some natural amphitheatre among the pine-clad hills, and around the rock there is built a rude platform of heavy beams to support the drillmen in view of the spectators. A great circle is roped off to keep back too enthusiastic friends. This spot has an elaborate repertoire of its own, with time-keepers, referees, and so-called; and it would be highly improper for outsiders to crowd so near the drillmen as to hamper them in any way.

On the Right is "Cash" Patterson, the grizzled Prospector who, with his young Partner, Nygren, bent All Corners in a Rock-drilling Contest of the Corner d'Alene at Wallace, Idaho

In one of the 4th of July contests at Wallace, Idaho, for the championship of the Corner d'Alene, eight teams competed—mostly robust young fellows, with the clear pluck and white skin that comes from long work underground free from the tan of the sun. But all these young abilities were defeated by the team including the celebrated "Cash" Patterson, a grizzled miner and prospector over fifty years old, who for fifteen years has been carrying away these trophies.

In these matches one man, crouching close to the rock, holds the drill in place while his partner wields the hammer. At brief intervals they change places, but so perfect is their training that even in the change there is not a stroke lost in the rhythmic roar of the sixteen pound sledge that beats, like a huge triphammer, seventy-five blows or more in the minute.

It takes a dozen drills to carry a team through a contest, and they range in length from one to five feet. As the hole deepens, and the bits are drilled, the supreme test of skill is shown when the holder snatches out the old drill and thrusts a fresh one into place in the fraction of a second that elapses between blows of the sledge.

The winner, "Cash" Patterson, and his partner, Nygren, in fifteen minutes drilled a hole thirty six and two eighths inches deep into that adamant granite. At every blow the steel sank perceptibly into the rock.

A Group of Drillers at a Rock-drilling Contest held at the Corner d'Alene, Wallace, Idaho. This was the Contest won by old "Cash" Patterson and his Partner, Nygren

JAMES MONTGOMERY FLAGG

TSIDER

NTGOMERY FLAGG

The Rise of Fairview

BORN in the dawning of 1906, Fairview, in Humboldt County, is one more addition to Nevada's roster of phoenix-formed camps which, with a year and a half of development, ran hoisted on lucky values as he under the brooding sun of the little-brown State. One of her heirs is already a regular distributor of dividends. A score of others verge upon such status.

Fairview's most famous producer is yielding an output whose average value exceeds that of Goldfield's. Moreover, the district is no longer an experiment. It is an asset reckoned with by such statisticians as make honest effort to compute and compile the annual mineral production of Nevada.

Back in the middle twenties this region was known to Uncle Sam, as appears by a notice filed on a monument on Fairview Peak, 8500 feet above sea-level. The writing is dated September 24, 1878, and was posted by a party of California division surveyors under Lieutenant H. Birnie, of the Thirtieth Infantry. That little army corps tramped the ground that now forms the town site and covers the mines of Fairview.

Forty miners, culled from every section East, travelling by pony express, halted at West Gate, a watering station on the Overland route. West Gate is a part of Fairview. Flout was kicked from the dust and eyed through pocket lenses; but it bore not the ear-marks of the treasure they sought, the fabled yellow flakes from California's golden sands, and with the passing of the pony express Fairview retired to long slumbers. Rejuvenation came with a visit by F. O. Norton early in the fall of 1903. Norton was a poor prospector living at Reno. Three months after his discovery he had sold claims for \$200,000, and in February of 1904 the stamp was on his forehead.

Today he who journeys hither, not by pony express or on burro-back, but in Pullman cars and luxurious autos, finds a city the goal of steam and trolley railroads; a metropolis whither water is piped, where ice is to be manufactured, where electricity provides the light, and where the power of the great dam where more than a score of hoists are lifting to sunlight rock that is heavy with gold and silver or the coarse country cupping that conceals it; a district, the central attraction of the present market in Nevada shares, commanding the attention of silver and gold miners, and still more so of the State's pioneers, Nevada's great millmen, and the country's every curb this side the water, and even existing exploratory energy from England.

Fallen, forty-two miles northwest, terminal of a spur from the Southern Pacific, is Fairview's present railway station. Last March the Southern Pacific completed a survey from Fallon to Fairview and Winnemucca, acquiring rights of way, perfected other preliminaries, and announced that the branch would be ready for service by October, the cost to be about \$100,000. Delays occurred; the Nevada Hills Mine was galled with rich ore for which it could find no adequate transportation facilities, and the management met, discussed and determined to build an independent broad-gauge railroad to Fallon, the work to be finished by next April. The money is on hand to carry the adopted plans to speedy execution. Meanwhile, the Fairview Electric Railway and Power Company is arranging to build a trolley line from the city to the producing district. E. D. Lidsdale is the proprietor of the electric scheme, and is backed by San Francisco and local capital. Lighting is one of its objects.

Government officials have granted contracts which will give Fairview a water-power equal to 4000 horse-power from the middle of March to the middle of September, and 2000 horse-power the remaining months of the year, the supply to come from a dam across Carson River near Fallon, where 10,000 horse-power is available. A lead company has shipped in a powerful pumping plant to haul a supply of excellent water from Fallon to mine, and will also install apparatus for the manufacture of ice.

Fairview, at this time of quotation slumps and trade stagnation, is more than holding its own on every Exchange listing its securities. Cash, to be applied to development of the promising mines and new prospects, is pouring in from every quarter. A significant circumstance in the business' renaissance came from Nevada operators—miners in position to judge most accurately of the merits of the diggings. According to Nat Thoselin, the miner actor, who is now devoting most of his time to exploiting Fairview claims, English money will soon be on hand assisting the construction of the new prospects into shipping concerns.

Geologically, the characteristics of Fairview and Virginia City are almost identical. Both are of a primary formation that is deeper than the majority of Nevada ranges, Tonopah being the nearest approach to it. Nature has done much of the sinking in Fairview, as is evident in properties in the eastern section of the district, where croppings on such claims as the Climax correspond to a depth of 200 feet on the old Comstock, and reveal the same sort of quartz, taking into account the leaching that has been in process for centuries. Fairview is relatively a thousand feet deeper than Nevada City.

Two claims were leased by Percy Langdon early in the history of Fairview and christened Nevada Hills. W. H. Clark, John H. Davis, John T. Hodson, John A. Kirby, M. V. Rice, and W. H. Weber looked the prospects from the prospector, Clark, Hodson, Kirby, and Rice were pals together, but in 1904. They paid \$2500 for the ground, and in 1906, in June, they cleared \$8000 on their maiden shipment to Salt Lake, the first carload, taken practically from the grass-roots, averaging \$254 the ton. There were sold 50,000 shares of the stock at par (\$1), but none of this fund was ever required in the development of the mine. Two

months later the market price jumped to \$275, and the valuation of Nevada Hills on Exchange has since been \$6,500,000. On September 30 there was paid the third dividend of \$75,000, settling the total disbursements of breed money to \$225,000. There were left \$250,000,000 worth of ore in sight, a pay shot demonstrated for a continuous distance of 1000 feet, \$1,000,000 worth of rock sacked for the market, and sufficient cash on hand to guarantee the building of the mine's own railroad to Fallon. At the rate of sixty tons per day, the wagon haul to Fallon would cost the mine \$340,000 in a year, and that mine will build the road. In the slope that is thirty feet above the 130-foot level there lie great masses of ore whose silver and gold contents make it worth \$6000 per ton.

On September 30, the date of its expiration, the parent company purchased the outfit equipment, including two powerful hoists, of the Nevada Hills Leasing Company's lease, which had been shipping at the rate of \$300,000 per month, the product running from \$150 to \$250 the ton, and average \$100 or having been thrown over the dump. Hereafter those lease diggings will be operated on contract account. Their greatest vertical depth is 200 feet. On the dump lie about 3500 tons of dirt worth from \$40 to \$100 the ton.

Naturally next in importance and geography is the Fairview Eagle, a wide estate that sidelines Nevada Hills on the north and east, and was purchased by United States Senator Nixon and George W. Richards, of Salt Lake, in a year, and that mine for the shooting. They selected Fairview Eagle as the most promising prospect of that period, and that they judged wisely has been demonstrated in later revelations. After only a year of development Eagle has exposed shipping ore in four places, and has furnished the most magnificent example of a year's career, boring tapped at a depth of 200 feet fifteen feet of solid sulphide ore that all averages better than \$50 the ton, with two feet running \$700 without sorting, and smaller seams going up into the thousands. The sulphide formation, which is the strongest possible proof of permanency of values with depth, is deeper than the lowest levels of the adjoining Nevada Hills, and is regarded as the most important revelation of the camp's brief history. The product of the Eagle runs in silver, gold, and copper, about three-fourths of the value being in the white metal. The output is being sent at three times the old regular shipment rate, the order so soon as there shall be implanted machinery to handle the flow of 8000 gallons of water per day, tapped simultaneously with the uncovering of the sulphide ledge. Fairview Eagle bought the first hoist delivered to Fairview district, and has never let up on development. Considering physical improvements, there has been nothing strange in the fact that Eagle stock two weeks went from sixty-five cents to \$2, a gain of 204 per cent.

At a depth of only six feet the Jarvis lease on the Fairview Eagle extracted thirty-six marks of shipping ore, and later ran into a big body of equally rich goods on the fifty-foot level. In its No. 2 shaft this level is now mining on a four-foot shoot of ore at 150 feet depth, the product ranging in silver-gold value from \$100 to \$1000 the ton.

Six miles south of the proved bonanza belt, where lie the Eagle and Nevada Hills, is located the estate of the Nevada Fairview Company, controlled by Salt Lake operators. Initial shipments from that mine averaged \$100 per ton, and subsequently there has been evidenced a material enhancement of values. The mother lode of the section measures all of sixty feet in width.

Brief mention is here made of other Fairview mines and prospects:

Climax.—Six claims, a mile northwest of the Eagle and on the trend of its ledge. Andesite and granite contact 200 feet wide, courses across estate, boldly outcropping. Has extension of Golden Boulder lead, and float assays as high as \$4000 the ton.

Chigger.—East of Arva. Two leases successfully operating.

Crocker.—Eight claims four miles south of Nevada Hills. Tunneling for depth on silver sulphide ledge.

Crocker.—Just installed a sixty horse-power hoist.

Crocker.—First Fairview find, located in the winter of 1903-4. Northwest of Fairview Eagle and west of Boundary Dump. Mine shaft, 100 feet deep, has yielded a good body of ore, and is sinking for 500 feet depth on ledge that showed much high grade on the 100-foot level.

Gold Craze.—Five miles east and south of the heart of the district. Richest gold of this section found in a large dyke, peering for a length of 1500 feet into the Gold Creek basin.

Golden Shovel.—Northwest of the property of the Ida Mines Company. With forty horse-power hoist in commission, the management is going to great depth on ledge whose croppings show fine values.

Ida.—North of Arva and northeast of Eagle. Lease being operated by Ludwig & Company of San Francisco.

Butt.—Extreme northern portion of district. Has powerful Western gas-engine. Soaking substantial depth.

Ida.—A little northeast of Fairview Eagle. Vigorous exploration, involving tunnels and shafts.

Ida.—Five fractions adjoining the Eagle on the north, and three claims far to the south. On direct line of rich strike on Eagle's No. 2. A promotion of Patrick, Elliott, & Camp, but now the possession of prominent capitalists of Fairview and Goldfield.

Ida.—Sinking last-foot shaft by contract.

Verde.—North of the Pyramid. Sinking 250-foot working shaft. Has fifteen horse-power hoist.

Red Red.—Southwest of Golden Shovel. Streamlined development of a most promising ledge system. Hoist based on the ground.

Ida.—Favorable showing in main shaft.

GOLDFIELD, NEVADA, WHICH DESERVES ITS NAME

THE DISTRICT OF WHICH THIS TOWN IS THE DISTRIBUTING CENTRE IS ONE OF THE RICHEST GOLD-PRODUCING REGIONS IN THE WORLD

Fluck and Luck in the Desert

By BARTON WOOD CURRIE

AMBLANCE at the careers of the foremost men in that little company of rugged pioneers who established themselves on the map of Nevada, and dug from its hills a great store of treasure, brings to notice the names of George Wingfield and "Diamondfield" Jack Davis.

George Wingfield is still in his twenties. Six or seven years ago he was a penniless cowboy; that is, he was usually penniless within a week after pay day. This was due both to his generosity and speculative bent. The possibilities in furs, roulette, sequent, chuckback, and divers other diversions unknown of Hoyle, which under certain (not usual) conditions yielded handsome returns for small investments, fascinated him from an early age. It was this insatiable lust. If we view it through a proper moral lens, that lured him on to vast achievements at an age when most college-bred men are lugging their sheepskins under their arms and marching forth in the mighty stride of human endeavor. George Wingfield saw much of strife, tests, and there was the smoke of powder and the taste of lead in it. That he was unusually favored of aces goes without saying. To sum up his career, it would seem that he merely clasped hands with the blind goddess, whereupon she, moved by one of her eccentric, unaccountable whims, swung him off his first, and span him without let or hesitation to the dizzy heights of plenty.

While an unbroken had he learned to punch cows and rope steers on the Washoe range, as his father had done before him. So he was raised among rugged folk. In the cattle towns of northern Nevada he became a close student of the primal law which deals with the survival of the fittest. He learned to stand with both hands. He learned not to drink, but could not withstand the fascination of gambling.

It was a sober fascination, however, and he set out to study the subject from all its aspects. He dealt furo and tended roulette under many masters. He played for and against "the house." Always he played fair, and his conception of fairness led to many quarrels in which he soon earned fame as a gun-man.

"The scilicet and surest man with a gun in the State," he has been called. Furthermore, you will hear from many sources he was just as dangerous with a gun empty as loaded. He preferred, if possible, to vanquish an antagonist with a tap on the head

astrologer's eye he would have rejoiced to notice how radiant it was, and what a splendid sidereal mansion it was slipping into. He was cowed from vague glooming by a slap on the back, and turned to shake hands with Senator Nixon.

They had met before in Hawthorne, where the Senator did a small banking business. He liked the young man, as every true Westerner admires a man who can do big human things, such as facing down a roomful of armed bullies, telling them quietly that they were bullies, blacklegs, and tin-horns, softly suggesting that they drop their guns and raise their hands and surrender, being obeyed. Then the fact that the boy was the only person concerned who had not mentioned the incident brightened Mr. Nixon's evening for him.

So it came to pass that the United States Senator staked the young cowboy, suggesting that he try his luck on another game. A while later Wingfield dropped into a sixth chair, completely circle about a bare pine table that was cluttered with little mounds of chips, drifts of gold and silver. They were playing table stakes, and the boy put his all on the table, and though it was a wofully slim pile compared with the shining heaps before the others, it was the welcome of the many little stakes that had been swept away from earlier plays.

Several years after this game I heard from the lips of one of those caroles of the frontier, whom it is your good fortune to meet now and then, a graphic account of the beginning of George Wingfield's astonishing career of luck. The narrative, as set out in the game, had been in it for hours, and could scarcely be over his heap of winnings when the young man "skinned" the ends of the first hand dealt him.

"It was bad enough," the carole related, "for George to begin with four deuces pat, against two full houses and a blooming posy of hearts, are high. But to catch family after family of court cards and fill in for fifteen hands running was certainly Elkhondo luck with the brakes off. He sat through sky-pot after sky-pot, an unblinking idol, and when down began to spit the curtains I spun in my last four-leaf chip for a show-down. Ed Sikes and Bill McGuire, the two earliest poker players of Hawthorne, were trimmed down to their belt knuckles. Wingfield had shot the whole table full of zero; from us all to a cold quit."

"Of course we were sore at being trimmed by a mere boy from a Washoe County ranch, but so one showed any inclination to get feisty. George never turned a trick in his life that wasn't on the square. Yes, there were some at the table who occasionally relied more on their artillery than on any mere run of the cards, but they were wise. They knew they were babies compared to the kid cowboy when it came to gun-play. All we could do was to choke over our smiles and congratulate him on his Jumbo run of luck. We've been doing that ever since. Now he's the richest man in the State, and little more than turned man at that. I'm an old dodger; been in mines and prospecting for half a century. I've had many a fine dish at the wheel, at furo, and at poker—but where am I to-day? Well, I've got a board and a shankel in a 'dobe hut, and looking down the main street you'll observe the highest, steepest graveyard in the world."

"At the time of the poker game, my friend, Reno was in a fever over stories of high play and high grade ore at Tonopah. And George Wingfield, reckoning that his tide was on the flood, skirted next day to the southern alitudes. At the Tonopah Club he found an open game with a sky-limit. He won steadily, playing with the resource of a man who's got Pan's backing. He got up from the table when there wasn't a chip left to play against."

"Passing out of that back room he stopped at a table at which the proprietor of the place was dealing, and sat down. Duck game way to down. The sun walked across the sky and night fell again, and the purple shadows had once more begun their breakneck dance when George rose from that table. He had broken the bank and the "house" changed hands."

The winning of the Tonopah Club amounted to almost the same thing as winning \$4,000,000 invested at 6 per cent, for during the years afterwards in which Wingfield ran it the net earnings never fell below \$300,000 a year. He lived in luxury, but the chance to be taken by the "house," and lived an expert accountant to estimate the constant net gain from the various tables. Then he decided the number of tables.

The Banquet which George Wingfield gave to the Members of the Goldfield Mining Stock Exchange and their Friends

rather than quiet him eternally with a bullet. He is not, nor was he ever, a braver. In fact, he is uncommonly taciturn and diffident, and in his conversation shrinks from the use of the first personal pronoun.

When he dropped into a now famous poker game at Reno five years ago he had no more idea that he was to become the richest man in Nevada within the span of a lifetime than Dick Whitington knew he was to become Lord Mayor of London until he met the nature faking out. The story has long been current that United States Senator George S. Nixon staked the youngster for this historic poker game.

Wingfield was standing just without the sunny glare of one of Reno's popular "clubs" jollying the best view into the cards of the wooden pavement and gazing poetically up at the yellow moon, so like the last chip he had played on the case queen and lost. His star was up there too, and had he had an

This was about the time Goldfield sprang into existence. Wingfield got there before the "ground floor" had been scratched, and bought a considerable area of it. He purchased two lots that happened to fall on the main street, and he bought the Mohawk claim. He set George H. Nixon in on the Mohawk and became his partner. The two lawyers now control a sixty-percent corporation of consolidated mines, with "Diamondfield" Jack Davis, of Idaho, Utah, Montana, and Colorado as one of their right hand men.

Davis came to Goldfield with a well-earned fame as a gunman, and the reputation of one of the shrewdest speculators in mines in

Idaho, and it was several moments before he could stretch out his big fist and grasp Mr. Hunt's slender hand. The latter was also embarrassed by the situation until Davis pulled himself together and said:

"To meet you, Governor, sort of brings me back pretty close to the edge of the grave. They were knocking the bump round my neck when that reprieve of yours arrived. If you will come over to my room I will show you the rope. It's a rather gruesome souvenir to keep, yet I wouldn't part with it for a damn good mine. Whenever I feel like getting at all wild it serves me up

The Mohawk Mines at Goldfield, Nevada, among the Richest in the Section, where George Wingfield made his first millions

the West. He had been a terror to those walking delegates of miners' unions, and has been on the blacklist of the F. W. W. for a decade.

The career of this young man was marked by an incident of unique dramatic value for those who are at a loss for thrilling situations in their Western romances. And I learned of it in this fashion, which is also not lacking in picturesque color:

It was in the Shamrock Club in Goldfield, and I had just been introduced to former Governor Hunt of Idaho, Henry Weber, one of the new millionaires of the district, had performed the office of introduction. We were chatting of mines and millions when, about a rather insignificant man striking appearance, entered.

"There's 'Diamondfield' Jack Davis, Governor," said Weber to Mr. Hunt. "I suppose you know him."

"No," replied the former Governor. "I never met him, but I once issued a reprieve for him when he was about to be hanged. It was in Idaho in the strenuous days of the Cour d'Alone. He was arrested for the killing of two miners—members of the union. The evidence was flimsy enough, but the 'fear of God' inspired by dynamite and sawed-off shotguns seemed to work a potent spell upon judge and jury in the remote town where the trial was held—some thirty miles off the railroad.

"Well, as it was presented to me at the time, once the nation agents had succeeded in getting the conviction they made all possible haste to execute their money, hoping to swing him off before his friends could get to me and appeal for a stay. But they managed to get to me and I granted the reprieve. They had to arrange a relay of ponies to carry it to the place of execution; and it arrived, I believe, just as the rope was about Jack Davis's neck. He got a new trial and was acquitted. I understand there are no merrier young men than he standing in shoes today, and should rather like to meet him."

Weber called Davis to my table, and when he said, "Jack, this is ex-Governor Hunt, of Idaho," "Diamondfield" Jack's swarthy skin

like nothing else could." The ex-Governor was curious to see the rope, and the pair left the clubhouse arm in arm.

"Diamondfield" Jack Davis never reckoned his years of dangerous activity as mine superintendent and promoter, when he was marked by the Western Federation of Miners as "undesirable." He earned a reputation as a gun-fighter in every camp he lived in, and in Goldfield during its early days he lived up to his fame.

In the open streets of the great gold camp, a year ago last September, he and George Wingfield drew their guns and defied a mob of one hundred and fifty miners who had pursued a non-union worker to their offices. So great was their reputation as gun-men that they were left in sole possession of the thoroughfare.

When in his sprightly moments David had a little trick of opening a bottle of champagne by shooting out the cork at fifty paces that occasioned considerable nervousness in Goldfield restaurants, and one fragment of his history deals with an even more astonishing feat of marksmanship. The story goes that he became aware of a man stalking him with a shotgun, turned on the would-be assassin, fired two shots, and pierced his ears so neatly that afterwards the man could have worn rings in the bullet holes like a Cornish headst.

Though this thrilling bit of anecdote was told and retold with solemn emphasis in many saloons and corners of Alkali land, its strict veracity may be doubted. Davis never carried what some frontiersmen call "parlor ordnance"—revolvers and .32s. He balanced himself with a pair of 10's 4's, one hooked to his belt over each hip. The victim of such sure-shooting must, therefore, have possessed extraordinary ears not to have lost them altogether.

Nevertheless the fact remains that these two quiet, steady-eyed young men have passed through many desperate moments that required the sort of nerve and fire of which epic heroes are made; and undoubtedly if there were more of their calibre down in the new county seat of Esmeralda there would have been no demand on the government for regiments of regulars to settle Goldfield's labor troubles.

THE Y. M. C. A. IN MINING TOWNS AND CAMPS

THREE hundred and fifty men are building a bridge for the Western extension of a railroad on the "raw edge of nowhere," in South Dakota. The gang took seven days in the week and live in makeshift bunk houses in the construction camp. The Young Men's Christian Association has gone forward with the construction gang, and makes its headquarters in a passenger coach run in on a siding by the company. From the day the coach was opened it has been crowded with men from daylight until midnight, and the hard-boiled beaten track in the camp leads there. The general secretary has been appointed postmaster, and each day nearly all of the three hundred and fifty men working on the bridge come to the car for their mail. Since it was opened the mail sent out has doubled and letters have been sent home by men who had fallen in with the rough life of the West, and had not written since since coming to the camp.

Sunday night religious meetings packed the car with one hun-

dred men, while a stereopticon talk given by the secretary in the dining room brought out two hundred and fifty. Then the men would not go to their bunks, but stayed to sing "Yield not to temptation" and other gospel hymns, and listen to a talking machine.

After one of the meetings a bridge builder wanted the secretary to go over to his bunk house and reason with his partner about gambling. He was told that every man would be gambling. When he arrived no gambling was going on there or anywhere in the camp, for the meeting had put a stop to it. Christmas night the big men of the rough camp held a Christmas festival, which was as popular as in a Sunday school of children.

On pay days saloons had cashed \$3000 in checks, but by arrangement with the banks this is done in the Association car. Here it becomes easier to send the money home by mail, and less money now finds its way over the bars.

THE WEST'S UNDAUNTED SEEKER

DRAWN BY W HERBERT DWYER

Boston Consolidated Mining Co.

The mines of the Boston Consolidated Mining Company are situated in Bingham Canyon, Utah, 28 miles southwest of Salt Lake City, on the line of the Rio Grande Western Railway, at an altitude varying from 6500 to 7700 feet. The property of the company at Bingham consists of 51 patented claims, approximately 380 acres, which includes the Sulphide Mine and the Porphyry Mine, two distinct and separate mining schemes. The company also owns over 1000 acres at Garfield, about 16 miles west of Salt Lake City, on which has been erected a large and thoroughly equipped Concentrating Plant, capable of treating 3000 tons of porphyry ore daily.

A tract of land comprising over 1000 acres has also been acquired on the west shore of Utah Lake, about 40 miles from the mines at Bingham.

The Sulphide Mine is situated on the eastern side of Muddy Gulch. The deep sides of the mountain at this point have been pierced by five principal tunnels, all connecting with large bodies of sulphide ore. Owing to the great size of these ore bodies, the square-set method of mining is used exclusively, and all the ore is broken and dropped through chutes to the lower level, where it is hauled by electric trains to the ore bins.

The Sulphide Mine is fully equipped to produce at present about 1000 tons of ore daily, assaying from 2 per cent. to 4 per cent. copper. In the fully developed portions of this mine about 750,000 tons have been blocked out, which averages 2.8 per cent., producing about 21,000 tons of copper. In addition to this, a conservative estimate shows about 375,000 tons of 2.5 per cent. ore in the portion of the mine which is only partially developed. This will yield about 9000 tons of copper. The value of the gold, silver, and excess of iron in this ore amounts to about \$3.00 per ton. The copper value of the ore averages, at 15 cent copper, \$7.90 per ton. The Sulphide Mine is one of great possibilities, and is by no means fully developed.

The Porphyry Mine includes 156 acres on the western side and summit of the mountain at an altitude of from 6250 to 7700 feet. About 25,000 feet of development tunnels have been run through this portion of the mountain, showing the body of pay ore to be from 300 to 400 feet thick. These tunnels have been assayed every five feet.

The estimated tonnage of the Porphyry Mine, as blocked out and fully developed, is as follows:

The 300 foot thick ore body, at 12.4 cubic feet of ore to the ton, will yield 58,581,000 tons, averaging 1.56 per cent. of copper.

In addition to this amount, the estimated tonnage of the ore bodies not fully developed is 113,405,000 tons of about 1 per cent. copper. The gold and silver values of this ore amount to about 20 cents per ton. The cost of producing copper from this porphyry ore, allowing for the gold and silver values, as above stated, varies from \$0.056 per pound for 2 per cent. ore to \$0.084 per pound for 1.5 per cent. ore.

The mining of the porphyry ore is all open-air work, and is done by steam shovels, the cheapest method of mining known.

The present equipment is capable of handling 15,000 tons daily.

The new Concentrating Plant of the company, of 3000 tons' daily capacity, which has just been constructed at Garfield, is thoroughly equipped and modern in every respect. It is situated on the mountain side, so that gravity plays an important part in the handling of the ore. The site includes over 1000 acres, thus affording ample space for disposing of the mill tailings. Three railroads cross the company's land at this point, viz.: The San Pedro, Los Angeles & Salt Lake, the Rio Grande Western, and the Western Pacific Companies.

The mill is about two miles distant from the large Garfield Plant of the American Smelting and Refining Company.

Newhouse Mines and Smelters

The property of the Newhouse Mines & Smelters is situated at Newhouse, in Beaver County, Utah, 250 miles southwest of Salt Lake City, on the line of the San Pedro, Los Angeles & Salt Lake Railroad.

The company owns 2000 acres of land, in which is included the rich, highly developed Cactus Mine, the large, well-equipped Concentrating Plant having a daily capacity of 1000 tons of ore, and the town site of Newhouse, with its modern Store, Bank, Opera House, Club House, Booming and Eating houses, Café and Restaurant, together with over eighty modern cottages, containing from four to six rooms each. These latter are built in the Colonial style, are electric lighted and supplied with hot and cold water, baths, etc., and are occupied by the employees of the company having families.

One of the most unique and attractive structures in the town is the Cactus Club, substantially built, of the bungalow style, and containing a reception-room, reading-room, billiard-room, bar, barber's shop, music and ball rooms.

The membership includes the business men of the town, mine and mill superintendents, and all employees of the company who are eligible and who may be elected by ballot. The club is managed entirely by its members, and has been so successful, both as a means of promoting good-fellowship and financially, that a new Opera House, Restaurant, and Café, with eight bedrooms for transient guests, have lately been constructed by the club.

The Cactus Mine was owned and developed about twelve years ago by two French companies, but owing to continued disagreement and lawsuits between these two associations, as well as a great scarcity of water for milling purposes, the mine was closed down and the property came under the hammer. In 1901, Mr. Samuel Newhouse, with great daring, planned and successfully carried out the redemption of the Cactus Mine, which resulted in the acquiring of this magnificent mining property and the formation of the Newhouse Mines & Smelters.

This company is incorporated under the laws of the State of New York, with a capital of \$6,000,000, divided into 600,000 shares of a par value of \$10 each, which are non-assessable and all issued. Mr. Newhouse realized the urgent necessity of an abundant supply of water for the use of the Concentrating Plant as well as the town, and he succeeded in purchasing the Wah Wah Springs, in the mountains on the west of the valley, eight miles distant from the town, this being the only available water supply in that section of the country. A reservoir was built

at the springs and a pipe line ran from it to another reservoir above the mill and town, and thus perfectly pure mountain water is delivered by gravity at the rate of over 1000 gallons per minute.

The operations of the Cactus Mine are carried on by means of a tunnel 600 feet in length, running into the side of the mountain 600 feet below the mouth of the shaft. 50 H. P. electric locomotives haul the train of ore cars, each car holding about three and a half tons, from the various ore chutes in the mine to the crusher-house and loading station, situated at the mouth of the tunnel. On each level of the mine immense ore bodies have been blocked out, and these have been cross-cut for distances of 135 to 200 feet, without, in several instances, disclosing the walls of the deposit, and they have been drifted upon a distance of 600 feet on the strike of the vein on each level, and from one level to another ore chutes have been sunk to the tunnel level, thus facilitating the handling of the ore, which is dumped directly into the electric train.

The motive power for operating the mine and mill has been steam, electricity, and compressed air, but the entire plant is now being equipped with machinery to be operated by electric power furnished by the Telluride Power Company's plant on the Beaver River, 60 miles distant.

The mining experts sent to examine the Cactus last spring, when the stock was listed on the New York Exchange, reported to the committee of that association that there were about 2,284,437 tons of ore in sight, of an average of 2.5 per cent. copper. In addition to this they reported about two million tons of ore under progress of advancing development. These estimates were based on a recovery of 80 per cent. of copper. In addition to the immense bodies of milling ore, above referred to, large bodies of high-grade chalcopyrite, running from 20 per cent. to 30 per cent. copper, have been encountered during the past six months on the various levels of the mine above the 600 foot level. This ore is shipped direct to the smelters.

Within the past few months an incline shaft, to be sunk 1000 feet below the 600 foot level, has been started, and a cross-cut from this shaft has been opened on the 700 foot level in 5 per cent. ore. This shaft will be continued to the 1000 foot level, with cross-cuts every 100 feet. These operations below the 600 foot or main tunnel level will open up a vast undeveloped territory of ore, the existence of which has been proven by means of diamond-drill borings.

The Treasure-House of Don Diego and his Spanish Adventurers

By JOHN KEENAN

It was more than three hundred and fifty years ago that a brave Spanish adventurer, Captain Don Diego de Velazquez by name, at the head of a small company of supporters, threaded and posted and fought his way through Northern Mexico in a westerly direction. Like scores of other courageous men, Don Diego had been lured across the Atlantic by tales of wonderful treasure in the new world, which was to be had for the asking. He had seen cargo after cargo of gold and silver ingots brought home to Spain from the newly discovered El Dorado; he had seen fabulous quantities of gold and silver vessels and ornaments obtained somehow from those lost-off regions—perhaps through gift from the strange, child-like, half-savage people who had mined and fashioned them; perhaps through the simple method on the part of Spanish adventurers of merely helping themselves out of the abundant stores of palace and temple. At any rate, there in Spain were ships and ships, returned from across the stormy Atlantic; and in their strong-rooms was treasure, beautiful to behold, massive, heavy, and exquisitely designed. And there also were captains and subordinates and gangs of uncouth, hardy followers, who, starting away from home poverty-stricken and often desperate, had in a few months or a few years come back rich as Cressus.

The knowledge of such treasure awaiting those who went after it, the sight of such masses of gold and silver ingots, the tales related by the men who brought them home, inflamed the imagination of Don Diego so they had fired the spirit of hundreds of others.

The year 1547 saw him at the head of his company, penetrating the forests of Northern Mexico, keeping savage beasts and savage men at bay, undergoing hardships of hunger, exhaustion, thirst, and never dreaming of turning back because ahead of him, at a definite spot, in one particular locality that he had heard of was a group of mines so rich, so extensive that they could make a thousand barones for a thousand men.

Finally, to cut a long story short, Don Diego and his followers achieved the wellnigh impossible, and one day found themselves, with glowing eyes and tense nerves, actually arrived at a great mineral camp, which they at once named "Providencia de la Nueva Vicería," and which is now the town of Santa Barbara. The

turbulence of their feelings, their joy, the dizzy prospect of having uncounted riches literally in their grasp, is difficult to realize at this far-distant day. How they were, at the end of their hairbreadth voyage, in the southwestern corner of Chihuahua, Mexico, within comparatively easy reach of the great Pacific Ocean. On every hand were Indians, not savage, but powerful, easy-going for generations, and close at hand were the vast treasures of another earth—Nature's strong-box, indeed, filled to overflowing with precious metal, only a little disturbed by the indolent, child-like Indians, who took out what they wanted and when they wanted it.

Don Diego and his company were men of stern stuff, who had journeyed thither for a definite object, and they wasted little time before making what at that time was a complete and careful exploration of the mines. That they were energetic can be proved to-day by the existence of ore on the walls of the ancient workings, which yield high assays of this precious metal; that their efforts were crude is likewise proved by the fact that they barely skinned over the surfaces of these bank deposits of the gods, having not the faintest idea that three hundred and fifty years later science and engineering and mining skill would make available a hundred times more wealth than they themselves could cut away and carry home on shipboard.

How long Don Diego stayed at the mines, or what other adventures he had on his way homeward, it is not the present purpose to relate. Suffice it to say that after he and his adventurers departed, hoarded with gold, the important mines and their fabulous deposits became almost forgotten, and interest in them was not revived until the railroad was approaching.

It was early last spring, 1907, that two business men, Mr. Howell Hink and Mr. Ralph W. Cavenough, learned through high sniffer reports that the mines were producing ore which was of surprising richness. With the enterprise and decision characteristic of wide-awake aggressive Americans, Messrs. Hink and Cavenough quietly started for Mexico in the month of April, and by reason of the present accessibility of the properties easily reached the mines, and after a thorough, careful, scientific examination they immediately purchased the entire group. The first news the general public had of what was virtually a rediscovery of Don Diego's treasure-house

Face of vein at bottom of Reforma Shaft—25 feet wide, no walls

Howell Hinds

came with the announcement that it had been secured by these two Americans, who found that the vastness of the field of operations was so stupendous that in May, last year, 1907, Messrs. Hinds and Cavanaugh organized a corporation known as The Hinds Consolidated Mining Company, limiting its executive and administrative offices at No. 1 Wall Street, New York City, with other offices at Cleveland, Ohio, and Santa Barbara, Mexico. The company was capitalized at \$5,000,000, and a very favorable contract was closed with the American Smelting and Refining Company, for 250,000 tons of ore, and because this ore contained a high percentage of lead it is very acceptable to the smelting company.

property, and have then told their friends of it, who likewise invested.

The Hinds Consolidated has tremendous ore reserves consisting of the following metals, gold, silver, copper, and lead; it has three large parallel fissure veins running through and outcropping the entire length of the property, over one and a half miles, and extending in breadth from ten to twenty-eight feet.

The building of the railroad has made it possible to ship the ore direct from the mill to the smelter. But, owing to their contract with the American Smelting & Refining Co., it is necessary only for them to ship the ore ninety miles to Pinal, where it is taken in charge by that company.

Expert after expert

has seen this property, and without a single exception all have been high in their praise not only of the tremendous possibilities and present ore reserves, but also of the management, which in every case has been pronounced excellent. They have openly stated that it is one of the best mining properties they have ever examined. Carl Barnell, an expert and mining engineer, sent to examine the mines by prominent New York capitalists, stated in a letter that "the ore bodies are so large and so open in character that the most casual inspection satisfied me of the existence of more ore than it will be possible to mine during the next twenty years. . . . I have every confidence that the Hinds Consolidated will be a steady and liberal dividend-payer, and I firmly believe its stock to be one of the best and safest investments at present available."

Mr. Urrin Allen, mining expert, in concluding his report on the property said: "I am of the opinion from the facts obtained by me at the mines and embodied in this report, that one of the largest mines in Mexico will be opened up. With good management at the mine, with the equipment I have suggested, this mine should pay out at least one-fourth the per value of its capital stock each year."

One of the stockholders, writing under date of Feb. 11, 1908, says: "I had a conference to-day with Mr. F. W. Wardwell, of Cleveland, Ohio, who has just returned from a trip to the property of the Hinds Consolidated Mining Company. Mr. Wardwell was very enthusiastic in his talk with me, and being a man of large experience and a keen observer, what he said to me in the course of our conversation was certainly very encouraging. He stated to me that in his opinion the property was a gigantic one, and that it would be a great success. He said that he was very much impressed with the entire management, and was dumfounded to find the amount of work that had been accomplished in so short a time. He further stated that the stockholders up here did not know what they had. While we were all aware of these facts, as stated to us from time to time, nevertheless a statement of this kind coming from a man of Mr. Wardwell's reputation certainly made me feel very good. Knowing that you would be pleased to have such information, I have taken the trouble to write you of the above interview, and feel that I certainly have a great deal to look forward to when I reach the property about the first of March."

The company has as its officers, Howell Hinds, of Cleveland, President, one of the most conservative mining men in this country; Ralph W. Cavanaugh, of New York, Vice-President and Secretary; Frederick C. Becker, of Cleveland, Treasurer; Frederick S. Stearns, of New York, Assistant Secretary; and Wm. W. Elmer, General Manager at the mine, a capable and practical mining man of wide experience.

It is confidently expected that the Hinds Consolidated Mining Company, a tremendous working mine, will declare large dividends for many years to come and will eventually be one of the largest producing mines in Mexico.

dated Mining Company has been organized less than a year; yet in these few short months development operations have been pushed to a remarkable extent. The brief story of this energy and intelligent development reminds one of the giant of old who, on attaining his growth, fell asleep and remained so for centuries, when he suddenly awakened, sprang at once into life, and commenced his career of heroic deeds and glorious achievements. It is more than three hundred years since Don Diego left the Santa Barbara mines, and they have done on decade after decade, undisturbed by the feeble and infrequent attempts to take out a little of their precious treasure. Now, however, after less than a year's effort, this modern giant, composed of gold and silver, lead and copper, is thoroughly aroused and active, and his name is known, his power and wealth are recognized, the world over.

One year only—one short year—since Americans took hold of the ten great mines. In that time the property has been equipped with the most modern and up-to-date machinery, three miles of standard-gauge railroad has been built connecting the mines with the Mexican Central Railway at the town of Santa Barbara, and an overhead tram is being constructed to bring the ore from the various shafts to the concentrator. At the present time the Hinds Consolidated Mining Company has five shafts, with an aggregate depth of more than 2000 feet, and between 8000 and 9000 feet of drift and raises, in addition to the great underground workings and surface and railroad construction, employing over 300 men.

The success of this gigantic enterprise is due solely to the enterprise, ability, and integrity of Messrs. Hinds and Cavanaugh, and to their staff of conservative assistants. Their steadfast plan has been at all times to work for the benefit of the stockholders, and understanding that the company was organized to operate the mines, Messrs. Hinds and Cavanaugh have not done as many other operators—organizing a company for the railroad with the profit for themselves; or a town-site company, or for the extension which they have just purchased at a colossal figure, consisting of the San Rafael and Calavera mines, which is the continuation of the great Santa Gertrudis vein and which has been tared over in this company.

To-day this company enjoys the distinction of having paid a quarterly dividend of 2 per cent. on the capital stock on February 27th, this year, and considering the financial disturbances, or depression as it may be called, which started in the last week of March, 1907, and has continued to the present time, it is apparent that the company has certainly accomplished a great undertaking. Not only has it put in all the equipment mentioned above and paid for it by the sale of stock, but its output of ore has been large enough to pay a substantial dividend within the year. It is a record well to be proud of. Nor has this stock been placed by significant investing men, as so many mining companies have sold their stock, but it has all been sold to conservative investors, a great many of whom have seen the

The company owns its own railway and equipment

Tom Lockhart

AFTER two years' incessant development work, comprising nearly two miles of shafts, drifts, and cross-cuts, the Florence Gold Mining Company is planning a monster quartz mill to crush the huge tonnage of millings ore which stands exposed throughout the underground workings and lies heaped on the dumps about the various shafts. The contract for the erection of the building has been let, the machinery has been ordered, and men are employed in leveling the surface for the foundation. Towering high above the other buildings surrounding the mine on the slope of the hill overlooking Goldfield, it will add to the scene of activity presented the entire length and breadth of the Florence property, and be classed among local mining as Goldfield Mill No. 7.

The management has planned its mill on what may be termed the unit system. This means that additional stamps can be added as circumstances warrant, thus increasing the capacity of the mill and allowing the future development of the mine to be conducted on a larger scale than ever before attempted in Goldfield. These and other details, including a perfect system of concentration and cyanide, have been carefully worked out for many months by the officials of the company in Denver, experimenting with various styles and types of crushing machinery, in order to discover the best process of handling the company's ores at the least possible cost and the greatest saving in gold values. When the first unit of the mill is completed it will consist of fifteen stamps, with a capacity of crushing 120 tons of ore per day.

That it is unlikely there will be any dearth of ore for many years is obvious, when taking into consideration that the main ledge is from fifty to sixty feet wide, nearly all of which carries good milling values. The policy of shipping exceptionally high-grade ore will be continued. From the general trend of the vein, northwesterly and southeasterly, and its dip to the east, it gives every appearance of being a permanent, true fissure, capable of being mined a thousand feet deep. The main workings are now in various levels, down to the 350-foot station. At the latter depth the ore has a tendency to carry a slight percentage of copper, this being considered an indication that somewhere deep down below the lowest mine in the mine, there will be found immense bodies of ore that will produce millions of dollars and eclipse all records for permanency and extent.

That the history of the famous mine needs no introduction to the public is felt assured, as its record for producing several million dollars to fortunate lessors is well known. Its interest, in the main, to the controlling owners—A. D. Parker, vice-president of the Colorado Southern Railroad, and T. D. Lockhart, a prospector whom he kept supplied with funds for twenty-three years—lies in the fact that the mine has at last rewarded their persistent search for a mining property that would make them independently wealthy.

James H. Macmillan

By James H. Macmillan, head of the firm of The J. H. Macmillan Co., Inc. Goldfield has one of the native sons of Nevada, who has met his fate with the mining industry of the State as recently come into prominence again through its mining activities, and pronounced success has crowned his efforts.

Mr. Macmillan was born in Unionville, Nevada. His father, one of the prominent attorneys of both Utah and Nevada, was considered the leader of the Democracy of the Sagebrush State for many years.

Mr. Macmillan acquired his early education in the schools of Nevada and Utah, but his trend towards mining was developed throughout Montana, including Butte, Anaconda, and, in fact, all the mining camps of note within that great State of the industry. It was there that he acquired his first thorough practical knowledge of what seems to be his natural life-work. For several years he devoted his time to newspaper business, and, in fact, his first venture in Goldfield (although he went there for the purpose of mining) was the foundation and publication of Goldfield's first daily paper, known then as the "Goldfield Sun" and later as the "Goldfield Tribune."

Mr. Macmillan was one of the pioneers of the Manhattan Camp, where he acquired heavy interests and made several successful promotions. One or two of these promotions are now considered in the list of most worthy properties in the Manhattan District.

Later, this young and energetic promoter gave the Goldfield District careful scrutiny, and decided that with good judgment and the proper management leasing would be a profitable venture in that high-grade camp. He associated himself with George B. Holliman, his present partner in The J. H. Macmillan Company, in the development of a block of ground on the Gold Wedge Fraction of the Jumbo Extension, which was incorporated and presumed under the name of Mohawk-Jumbo Lease Company. The history of that lease up to the present time shows that determination and good judgment on the part of Messrs. Macmillan and Holliman were all that was needed to bring the mine into being.

The Mohawk-Jumbo Lease shaft was continued to a depth of 450 feet, at an expenditure of \$50,000, and the result is three dividends already, amounting to \$250,000.00, with enough money in the treasury to pay two or three additional ones, and several millions yet in which to operate; so that the record of the Mohawk-Jumbo, in all likelihood, will be equalled by but few leasing companies in Nevada.

The J. H. Macmillan Co., Inc., has pronounced the Mohawk-Hed Top lease, which already is a pronounced success, and bids fair to eclipse the Mohawk-Jumbo.

The Mohawk-Newman Lease Company is another successful promotion of The J. H. Macmillan Company.

The J. H. Macmillan Co., Inc., is the owner of valuable properties in wonder, chief among which is the Wonder Queen Mining Company. The Company has also valuable interests in the Greenwater and Rosebud Districts.

Macmillan's four and one-half years of activity in Northern Nevada have made him thousands of friends and followers, and have given him a popularity which few mining operators in the West can rival. With a sunny and genial disposition, he is generally well liked, and while he is a man of keen business acumen, it is said of him that his greatest pleasure is in doing good for others. Most of such sound business judgment, sense of justice, and sturdy character are making of Nevada the great mining commonwealth it ought to be.

Loftus-Davis

THE rise from comparative poverty to affluence in a short time, on the square, must always prove interesting. The following story is true, because the writer was there and can vouch for it. J. P. Loftus and J. R. Davis, already spoken of as Loftus-Davis, have pulled together in double-homes ever since they struck Goldfield a little over two years ago. Both are exceedingly modest men and never talk about themselves, but as every one knows, and that is, they both came from Colorado, and when they landed in Goldfield neither had any more of the coin of the realm than the absolutely needed.

J. P. Loftus had been in the business of mining with doubtful success for thirteen years. J. R. Davis, or "Jim," as all his friends call him, had also had his ups and downs in mining. Their first venture was a lease on the Sandstorm, which was the first discovery made in Goldfield—or what was then known as Grandpa District, and which was found by Harry Stimler and Will Mish, Stimmer to say, this property had been operated by a well-known and educated mining engineer for several months, and thrown up Davis, who has as good a new vent for ore as a good newspaper man has for news, went after it and found it. The writer happened to be one of a number present when the property was prospected and first opened up. It was a mere matter of November, two years ago. To make a long story short, as near as the writer can learn, they took out about a quarter of a million dollars.

About three years ago the Bullfinch excitement had been at its height, and just a little time after, and on February 22, 1905, he succeeded in buying a controlling interest in the Gold Bar. His history need not be told. All the writer has to say is that he saw samples a few days ago in Goldfield, enough to make him worth \$3,175,725.00 now, which gives the Gold Bar to be one of the richest mines in Bullfinch District. Over \$1,000,000 in gold is now blocked out in this mine.

What Davis Did

When Mr. Davis had put this property on its feet, he came back to Goldfield, where he found the Sandstorm doing well, and so he cast about for other mines to open up. He looked over the area around, near Hammondfield, and found a property owned by a well-known mining engineer from Salt Lake, and had proven a failure.

Mr. Davis took hold of it for himself and associates, and in no time has made a pay mine out of it. His success was not at all haphazard, however, and so when the Round Mountain excitement broke out he was there with an automobile and secured the property owned by the Round Mountain Mining Company, the dry places from which alone produce over \$400 a day. The ore vein here is from nine to thirty feet wide, traverses the ground for 2700 feet, and has to date produced the richest gold ever recovered in Nevada. One million dollars in gold is now blocked out in this mine, and it is now producing \$50,000 in gold bullion every thirty days.

Fortune Smiles Further

Kind fortune was, however, not through with smiling on these gentlemen, and so when Fairview suddenly went up, according with Nevada Hills mine, Davis was "Jimmie on the spot," and bought a sixth interest in it for \$5000. The stock in this property is selling at over \$5.00 per share, and produced \$15,000 worth of ore in the month of September. The mine is now producing a good net return of \$60,000. Three dividends of \$75,000 have been already declared in December. The other owners in it are Jno. A. Kirby, W. V. Rice, W. H. Clark, Jno. T. Hodson, and W. A. Wadler, all Salt Lake.

In the Great Goldfield Merge

It will be recalled that the great Combination mine was turned into the great Goldfield merger, through the agency of George C. H. Robinson, for \$4,000,000.

It is among the most brilliant thing done—perhaps the most brilliant—and will return a fortune in itself. It brings them substantially into the merger, with Mr. Davis on the directors.

But it seems the end is not yet for these lucky ones. As these lines are being written the Loftus-Davis-Sweeney lease on the Combination Fraction, adjoining the famous Mohawk ground, is in "boom," and we have been found running as high as \$100,000.00 the ton, and from present indications this property promises to give a dividend in the district. One success in a lifetime is considered pretty good, but when no less than seven over in two years it breaks the record, and it looks as though even more was in store for them. At present, therefore, it is hard to say how much the success that has come to them.

Just Remember This

that as long as you make a business of gambling in mining stocks, just so long will the unscrupulous mining promoter thrive and you lose your money. You can just as well use the same amount of the money in purchasing mining shares as you would in buying a grocery store, and we feel sure that it will mean money in your pocket in the long run.

How often have you made purchases of mining stock without having once stopped to inquire what the really substantial fact was in the case where the property was, who the men were that controlled the proposition, in other words, you decided to "buy a horse" without knowing whether you were buying a horse or a mule. You registered a terrific kick against the mining industry.

Wouldn't it have been better if you would have taken only a little time and investigated the enterprise before investing? First find out who is behind the proposition, where the property is located, see if there are any producing mines in the vicinity—sort of assay the management before assaying the property. If you find that the men in control have a standing, are respectable, know the mining business, and the company name good prospective mining property, then you can safely take a chance with them. You can satisfactorily afford to wait a few months for the development of the proposition. Never forget that it takes time to develop a prospect into a mine under the most favorable conditions, just the same as it takes time to make a success of any business enterprise.

A firm that has any kind of a standing is not going to ask their clients to run them in a proposition that they can't be verily satisfied with. They are not going to stake in the first place, and in the second place it means more to them to make a success out of their mining propositions legitimately than otherwise.

Our firm practically started with the first discovery of ore in the Goldfield district. We have stood faithfully by the game, working hard, trying to make success out of our mining enterprises. We believe that we have succeeded to that extent, but we still keep working. We believe that our clients have confidence in us, and we keep working to the extent that we are reasonably comfortable and stronger. Of course, we are not infallible, but we do say that a large majority of our mining enterprise have proven successful. We believe in the Goldfield mining district, believe that its best days are yet to come, and that it will always stand as the greatest mining camp in this country, but there are other camps in the State that are making substantial showings as development progresses, particularly the camp of Fairview in Churchill County. Here is located a property that developed into a dividend payer in seven months from the time the first pay was struck into the ground. We refer to the Nevada Hills. It has already paid its stockholders \$250,000 in dividends. Immediately adjoining this property is the Fairview Eagle Mining Company, which is rapidly coming to the front, and probably has a much better showing at the same stage of development than the Nevada Hills. Now comes the Eagle's Nest, with big developments with only one foot of work. Then there is the Dromedary Hump, the Golden Boulder the Hades, the Atlas, all showing in good shape with but little development. We believe there is an excellent opportunity for making money in Fairview, not only for our clients but ourselves. We have thought so for some time and long ago put our man on the ground investigating, looking for something thoroughly good. We believe that we have found it. We have now control of a property that immediately solves the big problem of that district, and are now offering stock in this property for the purpose of development. We desire to increase our clientele and desire readers of HARPER'S WEEKLY on our list. We want to go into details regarding our new proposition from a "fair view." The Fairview Keystone Mining Co. We want you to have our map of the camp and full particulars regarding the Keystone. We want you to write us on the matter. We feel that we can invest your money in a mining proposition that will make you money.

We also have a fine map of Goldfield, which will be mailed upon request.

We give as reference the Crocker National Bank of San Francisco, the Atlantic National Bank of Los Angeles, J. B. Cook & Company, and the Nye & Ormsby County Bank of Goldfield.

GOLDFIELD CONSOLIDATED MINING STOCK EXCHANGE

L. L. Patrick

The name of L. L. Patrick has at every moment been identified with the early history of the northern Nevada mining camps and the best interests of Goldfield. In this he was practically the honor of the district, the first of the Goldfield District and giving the camp its first impetus. While Goldfield was still known as Grubtown, and the whole place consisted of a few hundred men hived in tents, Mr. Patrick came forward with a big offer for the Consolidated group, then a mere dream.

Mr. Patrick had great mining experience in Colorado, Idaho, Colorado, and Montana. In Leadville he was connected with Colonel Silver Mine, one of the most noted in Colorado. It was one of the original locations of the first Goldfield. Arriving a few days, A. D. Meyer made his rich arm of ore on the Consolidated. Mr. Patrick's knowledge of mining told him that here was a rare discovery. He purchased the property for \$100,000 on a one-year bond and lease, the cash consideration being \$25,000. So good did Mr. Patrick's judgment prove itself in striking the shafts alone enough ore was taken out to pay for the property in six months, together with \$25,000 for working expenses and improvements. In one year, besides paying for the ore, he gave enough ore to pay for a year for a life lease, build a twenty-stamp mill, deliver the first dividend of ten per cent., and place \$100,000 in the treasury. Patrick's initiative, therefore, made Goldfield its first one mill, its first dividend-carrying, and a mine that did more to improve conditions with the permanence and value of Goldfield than any other mine thing else. From this investment of \$25,000, a profit altogether of \$4,400 was realized.

During his active career Mr. Patrick has done much to popularize Nevada stocks from the profits arising to investors through his personal efforts. The reason for this is found in the care and judgment with which he has selected his properties in the first place, and the line of work in which he put them out originally, enabling the investor to make large returns. Among some of his successful promotions were the Black Horse, Black Horse Consolidated, the National Bank at Goldfield, and the Lumber of Goldfield, the latter of which was now a successful enterprise.

Mr. Patrick is showing his integrity through giving all his personal affairs and efforts at this point towards placing the affairs of Patrick, Elliott & Camp aside upon a business basis.

Mr. Patrick has recently taken hold of some large copper properties at Mina, in the heart of Nevada's copper belt. He has organized a company to build a water line and it will soon be in operation for the treatment of ores of the locality. When this is in operation it is expected that the brilliant record Mr. Patrick made when he organized the Consolidated Mine and Mill at Goldfield will be once again repeated.

Mr. Patrick has been the soul of all efforts looking to the social and economic betterment of Goldfield. He was one of the organizers of the Montevideo Club, and its first president. He has at present drawn out his public offices at Goldfield in order to give his entire attention to business.

He has been said of him, "He is distinctly a man of affairs, quiet and unassuming, yet shrewd and to the point. He has the spirit of a true business man, and the sense of a true citizen. He has the sense of a true citizen, and the sense of a true citizen."

Rhyolite Mining and Brokerage Company (Incorporated)

In the most exciting and strenuous period of mining camps where sensational values are found, a large number of men follow the proper methods that secure success in business transactions; but when the storm of excitement has cleared away it is generally found that some firms, that were never in the forefront of wholesale advertisement, nor were represented by seventh agents, are the successful ones, relying only upon sound judgment and meritorious work in all business transactions, are the men who retain substantial patronage and public confidence.

Stirling integrity and square dealing have won a name and a large business for the above company. This company is one of the oldest, most substantial, and most reliable concerns of Southern Nevada. It was formerly a partnership, composed of Judge L. O. Ray, J. B. Lindsay, and John Luckman, but it is now incorporated, with a paid-up capital of \$100,000. J. B. Lindsay was withdrawn from the firm, and J. A. Lindsay has taken his place as a member of the corporation. The Rhyolite Mining and Brokerage Company has perhaps done more towards the developing and upbuilding of the Bullfrog District of Nevada than any other concern in that part of the State.

Judge L. O. Ray, the head of this company, is now a resident from Nye County, Nevada, and is known from New York to San Francisco as one of the able and successful mining men of this grand old mineral commonwealth. He was one of the pioneers of the Black Horse, Black Horse Consolidated, and in that locality, and from that day he has labored unobscured and faithfully in searching out the many rich veins of the district, and has been one of the locations of the famous Denver, Tramps, Echigo, Perrier, and Victor mines, which are worth to-day many millions of dollars. His ability and sound judgment has taken his place as the material development of these noted properties.

The Rhyolite Mining and Brokerage Company is proud of its past record, but it has made the same of dollars for its associates and patrons without a single failure. In view of these facts, this company feels that it is entitled to a good reputation, at least, for securing a large volume of business to care and invest in this corporation, and that a keen interest should be taken in the reliable promotions now being presented to the public.

Nothing succeeds like success. The Nevada Legislature has been in session, Judge Ray has shown that he has many of the qualities of a law-maker as well as mining and business man. He is one of the most prominent members of the legislature, having been given some of the more important committee work.

The Inyo Gold Mining Company

The Inyo Gold Mining Company owns the original Hike and Leavitt locations in Echo Canyon, Lee-Echo mining district, Inyo County, Calif. The immense area of ground is traversed by a network of quartz veins, holding a general course, and all carry values from the roots. As far as explored, all of the numerous veins carry an excellent grade of milling ore with depths.

The famous Upper Ten ledge, the principal ledge in the group, is 225 feet in width at the base, and runs a long string of coarse gold at grade roots. The ore is entirely free—perhaps the freest gold ore in the district. The white granulated sugar quartz is so soft in places that for days the miners were not required to shoot, but simply shovelled in the ore and sent it to the surface. The richest ore in the property occurs in this character of material.

Vertical cutting on this vein has shown a strong, well-defined channel to a depth of 250 feet, and a cross-cutting the hill to reach the Upper Ten ledge, two other ledges have been encountered which are very promising. Lateral work is now in progress on two of the ledges, and excellent showings of milling ore are being obtained. The ledge, well as all of the several ledges on the property, are traceable for great distances on surface, and invariably carry good values in the groupings. The possibilities of the ground are simply immense.

On the Iron Old claim, the Inyo Gold group, 190 feet of sinking has revealed a ledge eight feet in width which carries an excellent milling grade of ore throughout. The ore is continuous from surface to the shaft.

The management of the company deems the establishment of a treating plant advisable at this time, as the amount of ore in sight justifies the expenditure. The water line of the Ash Meadows Company will shortly be within close range of the property, with a gravity flow from the summit of Furness ridge, and this important feature will be solved. With a mill upon the ground, these immense stopping areas now exposed may be utilized as a handsome profit.

The officers of the company are Lafayette Hobbs, president, Proctor, Utah; Theobald, vice-president, Rhyolite, Nevada; John B. Twelves, secretary and treasurer, Proctor, Utah; additional directors, John A. Kirby, Salt Lake; Samuel A. King, Salt Lake; and James Carr, Spanish Fork, Utah.

H. B. Lind

One of the early pioneers of Goldfield who, today, is considered one of the most conservative and one of the most favorably known mining men in the Sage-brush State. Mr. Lind exemplifies what can be done in legitimate mining on an honest, business basis, having in less than four years amassed one of the largest fortunes in the State through the development and sale of gold-ore properties.

The subject of this sketch is a firm believer in Nevada as the future producer of vast quantities of precious metals. However, he is equally firm in his belief that mining ventures should be approached by the investor from a sane business standpoint. "Use the same care in buying mining stocks and mines as you would in buying good realty," is his motto. If such care is exercised the good results, from a profit point of view, will prove certain and surprising to the investor.

Four men have reached the plateau of success, or even approached it, without having a less favorable cause to mention. (overlooked and previous to the "crisis" on his trial." Yet one of these is evidently Dr. W. K. Robinson of Goldfield, Nevada, leader of some of the finest practitioners in the district.

Born in Maryland in 1854, a son of Dr. R. K. Robinson, a noted surgeon in the Civil War, he, too, took up the study of medicine and graduated in 1875 at the University of Maryland. Believing that Germany meant what he said about the Wert being the place for a young man, the manner of that found the disciple of Dr. Robinson awaiting in the forests of Denver, Co.

The spirit of science, or rather the looking-out for opportunities abroad as well as at home, drove him to Goldfield, where in the early days of the famous mining camp he had a large practice. Believing that there was a future for the educated man in mining and mining, he took up the profession and in turn, with George Vickers as his partner, he began to earn the leasing of properties in well proven fields, and began the development of several promising ones.

Dr. Robinson took out leases in his own name on the famous Florence mine, then not widely known as it is today, and began the development of the Mohawk property. The advance was rapid and sure, and after he had proved the value of the property he sold it to the Mohawk Florence Mining and Leasing Company, of which he was made the Secretary and one of the general managers.

This company was incorporated under the laws of Nevada for \$1,000,000 (one million shares, at \$1 each), and the money for the further development of the property was provided by the sale of a portion of this stock at the nominal sum of 10 cents a share. Immediately immense returns began to be shown, and at the end of a year nearly \$1,000,000 had been returned to the stockholders as dividends on their investment, still leaving a considerable sum in the treasury with which to develop other properties already in the hands of the firm or in contemplation.

Before the lease on the Mohawk had expired, Dr. Robinson secured another property, and one which, as well known miner, Mr. Thomas L. Macdonald, had expressed considerable interest in. This mine came into being the Little Florence Company, with the same organization as the Mohawk, and under the plan of

Dr. W. K. Robinson

franchising the improvements necessary for a sale of part of the treasury stock was followed, thus the shares being sold at the nominal sum of but 10 cents, and they were quickly, now that it was known that Dr. Robinson had made good in the Mohawk, and that he was to be elected to give free presidency.

The confidence of the financiers in the Doctor was not misplaced, for up to the present time dividends amounting in all to \$400,000 have been declared and paid to those who invested in the shares of stock. At this time there are in at the market or in process of shipment some tons of ore

which will run \$25 to the ton. This is a reason to the funds made the conservative estimate, that the total returns to investors in this stock will reach \$1,000,000 before the lease runs out, and will be profitable.

But while earnings resulting from the income of the then acquired properties, Dr. Robinson was casting about for further profitable investments. He found his quest in a plot of three acres, adjoining the Little Florence Mine on the east, and abutting the widely known Jumbo on the north, and located directly on one of the largest mineral-rich belts of the whole region. This ledge has been proved at a depth of 300 feet, and at that level shows a vein of ore over sixty feet in width, assaying from \$45 to \$55 per ton. This ledge, the prospects for which seem to Dr. Robinson the most promising in his career, has four miles to run, and already the shaft is sunk to the 200-foot level and the mine is fully equipped with machinery. Great plans are now being made to fully develop this enormous vein and valuable property, and already it is the intention to go down to the 300-foot level.

The new company, named the Baltimore Belle Mining Company, has been incorporated, with a capital stock of \$1,000,000, and the shares (1,000,000 at a par value of \$1 each) are being placed on the market to capitalize the future development and the installations of additional machinery. A limited number only are for sale for the nominal sum of 10 cents a share.

Dr. Robinson has been made the President and General Manager of the new company, and as his judgment has been shown to be sound in his former operations, and as the value of the property has been proved, coupled with the fact that the lease has so long to run, investors are being attracted to it. These interests are always active in the Doctor, as in his office in Goldfield, and from him can get the prospectus of the Baltimore Belle, as well as lists of prices of other properties already mentioned here.

Referring again to Dr. Robinson's success, it should be said that he has never yet had a moment's worry over his investments, and although there have been many and rumors of war between copper and silver in the district, he has never had a day's sleep disturbed by the cause, and his confidence never to have been glad of his success and are moved with a desire to further it in every way which lies in their power.

Malcolm L. Macdonald

From a camp of straggling tents Tompach has arisen to the dignity of a prosperous city of stone buildings, with banks and handsome residences and flourishing mercantile houses. Southern Nevada has blossomed from sandy wastes and barren mountains into a great treasure-house, from which it is pouring its vast resources into the lap of the nation.

This great change, which has been accomplished in a few short years, has been effected by the hands of men with brains, perseverance, and unflinching courage. These were the men who built up this wonderful country, men who had the courage to try and the patience to endure, men who were not afraid to back their judgment with their money and to develop the properties of which they took hold.

Prominent among this class of men is Malcolm L. Macdonald, then whom there has been no more active agent in the development of the various districts throughout Southern Nevada. He has interests in every camp from Manhattan to Bullfrog, and from Kawich to Greenwater, including Goldfield, Beville, Silver Bow, Silver Peak, Furrow, Wonder, and, in fact, every camp of any note in Nevada.

Mr. Macdonald is a thorough mining man of long standing and is ever looking for new fields to explore. He went to Tompach from Montana in the early days of the camp, and became largely interested in Montana-Tompach. Since his advent in Southern Nevada, he has been among the first to get into every camp of any prominence, and he always has a corps of men in the hills looking out for new prospects. He is a man who has the courage of his convictions, and he never hesitates to develop any property that he takes hold of. He has been connected with nearly every big mining deal that has taken place in Southern Nevada in the past three years and is still as active as ever in the field.

One of Mr. Macdonald's greatest exploits was the big consolidation of Bullfrog properties under the dominion of the Silver-Bow Consolidated Mines Company. This included the famous Montgomery-Shoshone Mine, the Polar, and other properties, ultimately taking in the Amethyst and the Bullfrog Mining Company. It was in this deal that Macdonald

succeeded in getting Charles M. Schwab interested, through whom the consolidation was effected.

The next big Macdonald venture was the invasion of the Greenwater country. With Donald B. Gilles, Schwab's right-hand man in Nevada, Mr. Macdonald took a number of options on Greenwater properties and went through to the Death Valley country in his automobile. An examination of the properties on which the options were held proved so encouraging that the options were taken up in the shortest possible space of time and the copper estates transferred to Macdonald, Schwab, and Gilles.

The returns from Greenwater have almost revolutionized the copper situation of the world, for the percentages of copper which have been found are the most remarkable ever known.

Mr. Macdonald and his associates went right to work in the matter of development, as they have done with all their holdings, and they have been well rewarded for their courage. The first thing that they did was to incorporate the property into the Greenwater and Death Valley Copper Company. Rates of transportation into the new country necessarily made the price of material very high, so a proposition was worked out for the consolidation of some of the principal properties in Greenwater. As a result, Greenwater and Death Valley, Furnace Creek and United Greenwater are now under one administration, the lion's share of the consolidation going to Greenwater and Death Valley.

Many improvements are in contemplation for the new district, which include a smelter and a railroad. The present season will see a great crop in Greenwater and more laurels for Macdonald and his associates.

Another big achievement for this country was the organization by Macdonald and his associates of the Nevada Mines and Smelter Corporation. A smelter is to be established at Beville for the treatment of the ore from Kawich and Silver Bow. Ever progressive and watchful, Mr. Macdonald was among the first to learn that the Clark road was going to traverse that section of the country on its way to Ely. He had large interests there, and he quickly set about acquiring more. The building of the smelter will mean the opening-up of another big mineral section of Southern Nevada. The more men like Macdonald there are in the country the better for the country.

Malcolm L. Macdonald

Cobalt Central Mines Company

It takes three years at least to develop a mine as shown on various mining engineering, but Cobalt has destroyed many fixed rules of mining science, just as it has upset nearly every argument of the pessimists who, from evil design or ignorance, declared its silver deposits were not permanent, and that its ores were so refractory that they could not be successfully treated. Since these statements were first given wide circulation, two years ago, Cobalt has marketed over \$15,000,000 of silver, which, on its face, dispenses of the absurd statements that the ores are refractory, while shafts have been sunk to a depth of over 400 feet without any diminution of value, in disavowing engineers now concede that the Diabase, Huronian, and Keweenaw, which are the permanent formations of the country, all carry vast deposits of the precious metal in great depths beneath the surface. Indeed, J. H. Stockley, one of the best-known mining engineers in Colorado, after a recent examination of Cobalt, has gone on record with the prediction that the mines of that camp will be profitably operated many generations hence.

That it is possible to develop a Cobalt mine from a prospective to the productive stage in less than three years has been proved by the remarkable results of the Cobalt Central Mines Company, one of the largest and most enterprising of the corporations now operating in the camp. This company was organized and its shares brought out to the investing public by Thomas Nevins & Son, Bankers, of No. 37 Wall Street, New York, on December, 1906. Its properties are now 26 in number, and embrace 777 acres of mineral lands, most of which are located in the richest proven silver-bearing sections of the Cobalt District. When the properties were acquired no development of any consequence had been done upon them. Within one year, however, the properties have been brought to a productive state, full and up-to-date equipment has been erected, and shipments of silver are now steadily going forward to the smelter. The properties have been developed under the engineering direction of H. W. Harding, a consulting engineer of high standing, who has made a specialty of the development of mines, the work being concentrated upon the Big Pete, the Gamay, and mines on Lot 38, adjoining the Nipissing and Foster Mines.

The Big Pete Mine has been developed to a depth of 225 feet from the surface. Two levels have been run from the central shaft, on both of which fine veins have been cut, showing immense reserves of high-grade shipping and milling ore. Fifteen or twenty additional veins have been uncovered on this property, with surface showings identical with those developed in the lower workings, some of which assay as high as 7000 to 12,000 ounces of silver. These veins, showing on the surface, will be cut and developed from the lower levels. Good progress has been made in the Gamay Mine and Lot 38, and it is believed that these two properties will go on a shipping basis in the near future.

A concentrating-plant, with a potential capacity of one hundred tons per day, has been in operation on the Big Pete property for three months past, and has shown remarkable results. It has been making an extraction of 90 to 95 per cent. of metal values, a result which has attracted great attention from metallurgists because of its extraordinarily high extraction. As an example of its operating results, on March 16 last 10 tons were treated at the plant, yielding 4554 ounces of silver, which, taking the assay at its current market price, would give returns of \$3227.

A large number of important interests in New York City have identified themselves with the Cobalt Central Mines Company, and its shares are widely held by investors. These shares are listed on the London Stock Exchange, and dealt in very extensively on the New York market. The English representatives of the company include John E. Dudley Ryder, president of the Boston Consolidated Copper Company, and George H. Johnson, representative of the Newhouse interests in England. The chairman of the English committee is the Earl of Chesterfield, who is largely identified with very important mining interests in South Africa, Mexico, and elsewhere.

The Cobalt Silver Queen (Ltd.)

This property of 98½ acres shows a remarkably fine promise of steadily development. Originally one of the Temiskaming & Hudson Bay Mining Company's holdings, it was acquired by the present company in March, 1906. The new owners went at once into the development of the property, and within a year the process of transformation was completed, and the energy which has been expended began to show definite and paying results.

Up to the present time but six acres have been developed, and all the work of the year has been done on them, but the promise held out at the beginning of this week has been abundantly fulfilled. The development has been steadily going forward, showing almost daily a greater and greater yield of ore.

The shaft has now been sunk to a depth of 145 feet, and two levels, one at 75 feet and second at 125 feet, have been actively pushed forward until, approximately, 2500 feet of tunnel have been driven, requiring a fair body of ore estimated (on sight and blocked out) to be worth more than \$300,000.

Up to July of 1907, 145,126 bags of ore were ready for shipment, all of which went to the smelter in arsenic, cobalt, and nickel as well, by-products which yield a large revenue when the proper machinery for their salvage has been installed. At present the company's machinery is largely being used to save the loss of assays made on the general run of ore, irrespective of the sale of the silver.

The shaft has been divided into three-quarters of a mile west of Cobalt Station, and a spur of the railroad has already been laid on the property at Kerr Lake. The shaft is now in ore and is shipped directly from the mouth of the mine.

The ore is given three gradings: A, an exceedingly rich ore in silver, No. 1, also very rich; and No. 2, a rich ore in both runs from 225 to 2500 feet of silver to the ton, as good or better than the run of ore in mines that are paying propositions.

In spite of the fact that the money for development was raised from the sale of a part of the treasury stock, the first year's financial statement shows that shareholders of \$100,000 (4 per cent. of the total of \$5,000,000) had been paid to the stockholders, and that was done after paying for the machinery for a complete plant. The comfortable balance of the year was retained for the further development of the property and the increased machinery needed.

The company that commenced the installation of a large 12-hp air compressor to take the place of the old plant, and then they decided to do after six months of planning and testing the property to a depth of 145 feet and finding it to be so rich.

The officers of the company comprise some of the best known men in the mining world. They are: Lieut. Col. John L. Davidson, President; Fred J. Culver, Jr., Vice-President and General Manager; Robert Gordon, Vice-President; John H. Stephens, Secretary and Treasurer; and Messrs. Alfred J. Young and Peter S. Hainston, comprise the Board of Directors.

The Beaver Consolidated Mines (Ltd.)

THE BEAVER CONSOLIDATED MINES, with an authorized capital of \$1,000,000, is one of the propositions that will be more widely heard of in the near future, as the property is proving to be one of the best located in the Cobalt District which at the start showed far less prospect of success than does the Beaver. Since that time they have proved abundant sources of the mines of capitalistic warfare.

This claim comprises twenty acres in the heart of the ore belt, all of it proved as ore bearing, and from the first has more than repaid the effort and labor expended on it, showing remarkable returns to its promoters and stockholders. The property is located in the best section of the Cobalt District, and is paying properties surrounding it, the hope of its owners that it would prove a profitable proposition did not seem to be unfounded. The results gained in the property was opened have been such that even the most sanguine of its owners had hoped for; and the progress of development, which at first had been so slow, is being pushed ahead rapidly with the installation of new and improved machinery and an enlargement of the working force.

Two shafts have been sunk, one to a depth of over 100 feet and the other already down to feet. Shaft No. 1, which is the deeper, is 2½ feet in the clear, and is strongly and substantially timbered and well equipped, while Shaft No. 2 opened a level of ore that is not only in natural silver but in nickel and available silver as well.

When this shaft of ore is fully blocked out by the crosscuts which are already proving it, it is the intention of the company to sink both shafts to the level of the ore, and then apply crosscuts, so that the ore that is already showing exceeding richness on allaying properties.

The ore has already tapped and blocked out shows a return of 1000 tons of ore to the surface. At the present time the property has a force of twenty-eight men and a superintendent are at work, and as fast as room can be made more men will be employed.

The company has offices at Toronto, Canada, and at Cobalt. The officers are: Frank L. Culver, President; C. J. Booth, Vice-President; H. C. Troman, Secretary; and J. H. Stephens, Treasurer. The directors are: The Board of Directors consists of A. J. Young, W. D. Lumson, F. H. Clappa, and W. L. Churchill.

McKinley-Darragh-Savage Mines

The McKinley-Darragh-Savage Mines of Cobalt, Limited, was incorporated under the "Ontario Companies Act," on April 17, 1907, with a capital of \$5,000,000 in shares of \$100 each, of which about 4,000 shares have been issued. The principal stockholders are Toronto and Rochester capitalists, who have given the mines much personal attention.

The company owns the fee, secured by registry under the Torrens system and guaranteed by the Canadian government, of the following three mining properties, all about 10 miles in extent:

1. The McKinley-Darragh Mine, situated at the head of Cobalt Lake and adjoining the Temiskaming & Northern Ontario Railway.

2. The Savage Mine, about a mile south of the McKinley, on Hart Lake.

3. What is known as the Bennett Lot, in Buckle Township, about a mile and a half northeast of Cobalt Station.

At present the McKinley Mine is most actively worked, because here development could most readily be conducted and promised quicker returns. Much time and money have been expended on this mine in development, for a particularly strong evidence to the mine getting out of ore. Here have been constructed a power-house, with compression hoisting and about 1000 feet of tunnel, a sleeping-camp, a mess-camp, with seating capacity for 125 men, an office, superintendent's dwelling, store-house, bath, toilet-house, laboratory, and a concentrating plant with a capacity of 100 tons of ore an hour, and which is now run twenty-four hours a day. There is also a five-acre lot of ore at the head of the lake, which is a body of very rich gravel. The mine is now working more than 100 men.

Nine veins have been exposed on the McKinley, two of which (Nos. 1 and 2) are exceedingly rich, No. 7 being an extension of the famous Keweenaw vein of the Nipissing property, adjoining.

The concentrating plant will allow the company to send its ore to the smelter at its own expense, and cannot be shipped to the smelters at a profit, and gives promise of being a source of much revenue.

The Bennett Lot is altogether undeveloped, but shows several surface veins which promise great values.

The operation of the mines is in the hands of Captain John Harris, formerly superintendent of the Levee and the Ontario Mining Company, who is mining. The reports of expert engineers fully confirm the expectations of the directors, and the results so far have justified such reports.

W. S. Mitchell

WILLIAM S. MITCHELL, formerly of Boston, but now of Halesbury, Ontario, Canada, where he represents the Levee and the Ontario Mining Company, is one of the largest mine operators in and near the Cobalt belt, and stands sponsor for the Argonaut, Toronto, and Casey-Gold Mines.

The last named mine was the first discovery in Casey township, and has proved to be one of the best in that region, and likewise proved that the northern Ontario ore belt was of much greater extent than had been believed. The Levee and the Ontario Mining Company had been proved, Mr. Mitchell organized a company for the development and expansion of the mine, and active work was started.

After the preliminary work had been accomplished and the proper machinery installed, the first two carloads of ore were shipped, and the result showed that the mine was one of the richest in the region. The stock was put on the Exchange, and the mine is considered a good investment. On the Board of Directors with Mr. Mitchell are a number of the best-known mining men of the district.

The Toronto Mine is located, as its name implies, on the site of what was originally laid out the town of Cobalt. This property is one of the most valuable in the region, and as an evidence of the preceding rich results, the Levee and the Ontario Mining Company had been proved, Mr. Mitchell organized a company for the development and expansion of the mine, and active work was started.

The Argonaut mine is another promising investment property. It is owned and operated by the Argonaut Cobalt Mines Company, which is also on the Board of Directors. The company is now working on the property, and the results are showing a very good return. The company is now working on the property, and the results are showing a very good return. The company is now working on the property, and the results are showing a very good return.

These three mines are not the only ones in which Mr. Mitchell has been successful. He has also been successful in other mining ventures, and his success has been a source of much interest to the public. He has also been successful in other mining ventures, and his success has been a source of much interest to the public. He has also been successful in other mining ventures, and his success has been a source of much interest to the public.

The Redman: An Arizona Mine

YAVAPAI County, Arizona, which territory last year led the country in mineral production, is one of the oldest and best-known mineral zones in the Southwest, comprising within its borders such prolific producers as the Jerome and McCabe camps. These have stood the test of time and become noted for the volume of wealth their mines have poured, and are now pouring, into the coffers of the nation. Particularly has the McCabe section developed into its present pre-eminence as one of the richest of Arizona's camps, on the fundamental merits of its mines alone—without the accompaniment of stock-selling clamor, for which some of the more western camps are now conspicuous; and among the more important properties may be mentioned the Lelan, Jessie, McCabe, Gladstone, Triangle, and Iron King mines, whose combined record of production amounts to many millions in gold. A few miles to the northeast of McCabe, moreover, is situated United States Senator W. A. Clark's great United Verde, with a dividend record to date of \$21,520,322.

There are several other properties in this section rapidly coming into prominence, notably that of the Redman Mining, Milling & Smelting Company. This company's mine—the Redman—has been making steady headway for the past four years, under the management of W. T. Wintemute, of New York, and comprises an area of 200 acres. The Redman is located on the same lode as the gold properties above mentioned, and is only one and a half miles from the Santa Fe, Prescott & Phoenix Railroad and the Humboldt Smelter.

On the Galena-Flagler claims of the Redman Company, the greatest development has been carried on, the property being equipped with powerful hoisting works, air compressor, and machine drills, while a new ten-stamp mill and concentrator are now nearing completion, whereupon the company will begin the permanent production of gold bullion.

There are stated to be five strong, well-defined veins on the Redman property referred to. At a certain point they converge and form three compact veins, and run the entire length of the claims. The engineers believe that at a certain depth these veins will unite and form one immense ore deposit of great richness, the dip of the veins towards a common centre seeming to justify this belief. Assays taken by R. H. Hetherington, of Prescott, Feb. 5, 1908, gave the following respective values, \$84.36, \$32.24, and \$72.36, in gold and silver per ton, while an

assay of drillings by Thomas O'Neill, who recently visited the Redman Mine in the interest of Eastern capital, showed a value of \$80.20 per ton in gold and \$2.95 in silver, or a total value of \$83.15. This assay was made by Henry Carmichael, Ph.D., of Boston, Mass.

In a recent report, the mine manager of Redman says: "In opening up the Redman's ore bodies on the 100 and 200 foot levels, we have a stretch of stoping ground which will insure the continuous operation of the mill from the start." He also states that the other eight claims of the company are highly mineralized, and that it is the purpose of the management to ship all concentrates to the Humboldt Smelter, close by, as well as run the mill to its full capacity, increasing, as opportunity arrives, the number of stamps, so that the production of gold may be as large as possible.

Stock in the Redman Company has not yet been listed, because there are still public offerings being made through company channels; but when such listing is effected, the management believe that the publicity thus given it will greatly enhance the stock's value. It is true that in some instances such publicity has overreached itself—that is, where the original intention to inform investors as to true values has started such an avalanche of buying that the stock rapidly transforms from an investment into a speculation. For instance, speculation ran riot in Nipissing some months ago, and early investors reaped fortunes on an extremely moderate investment by selling out, all or in part, at its crest.

During the famous Comstock boom, Alpha Consolidated, which sold at \$13, sold in the same year at \$1570 per share, and stock in the Belcher Mine, which first sold at a dollar, advanced, on the speculative wave, to \$430 per share; similarly, Baltimore Consolidated fluctuated within twelve months from \$6.50 to \$1525 per share. It is perhaps hardly necessary to mention the more recent instances of the famous Mohawk, whose stock at private sale sold at its inception for ten cents per share, and, after listing, was rapidly run up to \$20 per share. Yet, be it observed, Mohawk, when selling at ten cents, had the same ore that made its stock worth \$20. The only difference was that, while a few knew this, the great buying public did not.

The affairs of the Redman Company are in the hands of W. T. Wintemute, Banker, 17 Battery Place, New York.

QUARTZITE ANNEX MINING COMPANY

Capitalization 1,000,000 Shares—Par Value \$1.00—Fully Paid and Non-Assessable

Subscription books are now open and the company offers 50,000 shares of Treasury Stock to be used for immediate development of their rich property.

The company owns the New Years, Albion, Lulu No. 1, and Sky Ann claims in the heart of the Diamondfield section of the great Goldfield Mining District, which were recently acquired from Diamondfield Jack Davis, the discoverer of Diamondfield, and his associates. The property lies very close to the famous Haier Mining Syndicate, it adjoins the Jumbo Extension, one of the big mines of the district, and the Diamondfield Triangle, another, and is adjacent to such well-known mines as the Diamondfield-Black Butte Consolidated, the Great Bend, and many others of note, the stock of all of which companies sold above par.

If you will cooperate with us we will share the profits with you. We guarantee a square deal and the judicious expenditure of every cent of treasury stock proceeds towards diligent prosecution of development work. The ore is there—it is no gamble. All we want is the necessary treasury account to expedite early development—the results will speak for themselves. There is already about 100 feet of shafting done, and assays of \$20.00 have been secured. For further information, address the company or call at 201 Chamber of Commerce, Buffalo, N. Y., or M. C. Scully, the President, Goldfield, Nevada.

Use the wires. We advise a reservation of your allotment by telegraph at our expense, and urge that immediate consideration be given our offering if you desire this stock at the present price. Act quickly—a repetition of the small investment and big profits that have made Nevada mines famous is our goal.

QUARTZITE ANNEX MINING COMPANY

201 Chamber of Commerce, Buffalo, N. Y.

THE OFFICERS OF THE COMPANY ARE:

- M. C. SCULLY, President, a mining man of twenty years' experience in mining throughout Montana, Idaho, Utah, Colorado, Nevada, Arizona, and Mexico. Mr. Scully has been most successful in his mining ventures.
- T. J. KAVANAUGH, Vice President, a San Francisco capitalist.
- H. H. TANNAM, Secretary, a well-known and successful Goldfield assayer, formerly of Minneapolis, Minn.
- C. O. HENDERSON, Director, a Goldfield mining operator.

Ubiquitous Gold

The earliest mention of gold is in the second chapter of Genesis, where it is referred to as one of the metals of the land of Havilah. Silver appears almost as early. The Babylonian civilization which, with that of Egypt, ruled the Biblical world, appears to have had a silver currency. "Shekels of silver" and "pieces of silver" are constantly spoken of. Gold was used chiefly for ornaments, its malleability and ductility making it the easiest of metals to handle.

The mines which supplied the colonies of the ancient world were in India. Solomon's sailors brought gold from "Tyhir," an unknown land for many thought to be Madagascar, in South-Central Africa where ruins of pre-historic Semitic forts and mine shafts have been found.

The Spanish conquest of South America flooded the world with gold and silver. Precious metals landed during a century. Before the discovery of America, a fat sheep could be bought for a quarter, and workmen had lived sumptuously upon five cents a day. The second great influx of gold occurred during the fifties of the last century, when the mines of California and Australia were discovered, and since then there has been a slow rise in the price of commodities, due to the increase of the precious metal; but on the whole the rapid increase in population has kept pace with the increase of gold.

IT MAKES THE BABY STURDY.

Good milk contains in the most easily digested form all the elements necessary to the building of bone flesh and muscle. **Borden's Eagle Brand** milk has just named these elements of strong and healthy babies. Has no equal as a baby food.

THE BEST WOMEN LINGERIES FOR CHILDREN are BORDEN'S VERMILION COMFITS. 25 cents a box.

ADVERTISEMENTS.

Pears'

There's a unique adaptability about Pears' Soap. It makes the child enjoy its bath, helps the mother preserve her complexion, and the man of the house finds nothing quite so good for shaving.

Have you used Pears' Soap?

Pears' the soap for the whole family.

BULLFROG 1000 SHARES FOR \$20.00

\$500 BRUSH

Here is a car for a man who wants a "four-wheel car" worth \$500 for each dollar he invests. The Brush will run from 15 to 20 miles on a gallon of gasoline. It has fewer parts than any car built, and all the machinery is easily accessible. Engine is under the hood. For ordinary use at moderate speeds, solid tires can be used with perfect satisfaction.

The Brush Roadster makes the automobile a practical, necessary utility instead of an expensive luxury. And it's a snap to start—starting car too, with lots of power—in fact, the simple, nearly instantaneous, powerful, wonderfully balanced vertical engine—leader of the Brush has more "real pull," hill-climbing ability (the true test of power) and road and sand navigability than any multi-cylinder roadster engine of the high-speed, engine-driven type.

Write us today and get in line for delivery—there's no "hard money" with us, because we're giving "value received" and make a car that people want better than they can get in the lot where we want to sell.

BRUSH KUNABROOK CO.

Nevada-Douglas

A COPPER-MINE MARVEL

By EDWARD GILLIAM

THE rejuvenation of the mining industry of Nevada, coincident as it is with the beginning of the century, and the reascendancy of the State as perhaps the greatest mineral kingdom in the Western Hemisphere, seem as easy to account for as a law of gravitation or any other natural phenomenon.

Along the State's eastern border extend the mighty Rockies, while to the west for 300 miles the Nevada Sierras are the boundary between Nevada and California.

Broadly speaking, Nevada is the centre of a great series of cosmic convulsions. The slopes of the Rockies and the Sierras constitute riparian limits, like the monster banks of a colossal river. Nevada is the channel through which and into which have been poured metallic treasures beyond all human computation. Through the immemorial ages and some comprehended by the word "geology," fire and flood and matter have wrought their changes, resulting in the formation of yellow, white, and red treasures, and their deposit in the various rich mining districts that are interlarded almost like so many chains stretching lineally from end of the State to the other.

Nevada's Mineral Primacy.

All natural conditions maintain Nevada's right to the mineral primacy of the West—to being the headquarters of future activity in mining. Here is the theatre of a marvellous geological romance—a trilogy of gold, silver, and copper.

Nevada was 43 years old on the last day of last October. Its first prominence was that of the Comstock lode, about 40 miles north of this district.

In twenty years—from 1859 to 1879—the Comstock produced over a half-billion dollars—I have seen the figures placed as high as \$500,000,000—about 60% of which was silver and 40% gold. No prodigious was the wealth and so crude and wasteful were the mining methods at that time, as compared with those of the present day, that \$600,000,000 in silver and \$800,000,000 in gold was lost in the process of treatment. About 70% of this loss, which is almost enough to cover the capitalization of the great Standard Oil Amalgamated holding copper corporation, could be saved by modern methods.

Comstock, though regarded as a memory, is still producing about \$300,000 a year.

Yerington a Neighbor of Comstock.

Yerington is a neighboring camp to Comstock, and its oldest mine and first shipper, the Ludwig, now a small part of the vast holdings of the Nevada-Douglas Copper Company, is linked in history with that most famous of all American mining camps.

This nest-egg Ludwig was discovered in 1903 by a half-breed old German prospector named Ludwig Schmidt, who drifted away from the Comstock in search of new gold and silver-bearing ground. History has it that he was grubstaked in his expedition by Mark Twain, and the story, often repeated, has never been denied. Mr. Clemens was said to have been at that time trying his "pretzel act" pushing a pencil on a Virginia City paper.

The Ludwig consisted of three claims (60 acres), but only one claim has been worked, from which millions of dollars have been taken. It is almost entirely surrounded by the Nevada-Douglas group of 900 acres, to which it was annexed June 29, 1907, making about a square mile in territory and formation of what is considered by many to be one of the richest copper mineralizations in the world.

Nevada-Douglas a World's Wonder.

East of the Rockies and throughout the Intermountain region I heard of the Nevada-Douglas mines as a world's copper wonder. Many called it the richest individual copper group in Nevada, others in the West, and there have been those—among them engineers and mining experts—who declare it to be one of the biggest copper entities they know of.

I came here to see it, and I find that practically every day some visitors interested in copper mines who have heard of its fame in different parts of the country. I know of a number of people in the East and New England who have journeyed here to see these bonanza mines. Not less than seventy-five copper mining engineers have visited and inspected the mines.

"Bonanza!" The word is indeed overworked in descriptions of mining properties. But what other word could you apply to properties that, in the course of development, rearing their banners and sinking their shafts in straight lines for working purposes, and hitting their rich veins as yet largely unexploited, make shipments to the smelters of no area running less than 10%—20% pounds of copper to the ton? What word would you apply to the Ludwig, which has made one series of shipments to the amount of \$200,000 of ore running copper 35%? What word would you apply to a veritable mountain of copper ore, the rich mineralization of which is not only shown in the surface outcroppings, but is already found to a depth of nearly a quarter of a mile below the top of the mountain?

The Nevada-Douglas consists of two divisions—the main group,

or Nevada-Douglas proper, and the Ludwig division. They are being exploited by a large number of shafts and tunnels, the principal ones of which are the Ludwig shaft, now being sunk to the 550 level, the Copper Casting and the Triple Compartment Shafts, and the Main Drive Tunnel, the portal of which is at the base of "Douglas Hill." This tunnel is being driven in a direct line straight into the heart of the mountain, the first unit to be about 2800 feet, paralleling a rich zone of mineralization practically the entire distance. At the termination of this first unit the main ore body will be tapped at a depth of about one foot from the top of the mountain. It is through this tunnel that the principal ore tonnage of the mines is to be conveyed to the surface.

One Tonnage Immense.

The ore tonnage of the Nevada-Douglas mines is something immense. I find many mining people at Yerington and other places in the West who believe the company controls one of the biggest copper deposits ever discovered. A prominent engineer recently said that the surface showings of the mines had no counterpart in all his wide observation, save at the world-renowned Copper Queen mines at Bisbee, Arizona, the properties of the Phelps, Dodge & Co. people, with offices in New York. Another high authority said that the property was "another Anconada." Others have called it "the most stupendous copper deposit ever discovered" and "the largest copper proposition perhaps in the world today." Such testimony of the company's possibilities I have been here personally investigating.

\$100,000,000 in Copper.

I have before me the reports made on the original Nevada-Douglas properties, and also the Ludwig mine, by engineer E. P. Jennings of Salt Lake City. Mr. Jennings, a veteran engineer, was at one time superintendent of the mammoth Utah Consolidated mines of Bingham, Utah, and has been engaged as consulting engineer with other large corporations and operators, among them the E. A. Wall of Salt Lake City.

Mr. Jennings went over Douglas Mountain, and estimated, that down to the first level, 100 feet, the company had a deposit of 10,000,000 tons of 35% copper ore. This applies to the main division only. Mr. Jennings also says that above the sixth level of the Ludwig there is available now \$1,500,000 in high grade ore, 10,000,000 tons of 35% copper—70 pounds to the ton—mean 700,000,000 pounds of copper, 700,000,000 pounds of copper, at 14 cents a pound, mean \$98,000,000 gross. At the high figure of copper for 1907, they mean \$182,000,000 gross.

Mr. Jennings says that he found 30,000,000 tons of such ore by his calculations, but that in the interest of conservatism he cut his figures two-thirds and made them read 10,000,000 tons.

Not only has Nevada-Douglas millions of tons of 35% copper ore, say those who know it, but it is equally remarkable for the high grade of its ores. It has hundreds of thousands of tons of 6% ore, and for the past six months has been shipping ore to the smelters which ran from 10% to 20% copper. One lot of precipitates recently shipped averaged 72% copper—1450 pounds of metal to the ton of ore!

A Million Tons Ready for Smelters.

I met the superintendent of the mines, who has just returned from a trip to the Eastern offices of the Nevada-Douglas Copper Company, in charge of A. J. Stern & Co., 60 State Street, Boston.

He said, in conversation with me: "Nevada-Douglas has been pushing development work at a rapid rate for the past year, and now has a million tons of ore available for smelter treatment that will average 35% copper. I believe we will have a smelter here in Yerington before the close of 1908, and I believe that the already developed tonnage of the district will cause the Southern Pacific to extend a branch line from Washoe, 18 miles away, into the district in the near future."

I am not a technical mining man, but I took out my pencil and figured:

35% copper means 100 pounds to the ton;
1,000,000 tons—100 pounds to the ton—mean 100,000,000 pounds of copper;
100,000,000 pounds of copper, at 14 cents a pound, mean \$14,000,000.
And this is but the initial ore accumulation of the company.

Senator Nixon on Yerington.

I recalled a recent statement from United States Senator George S. Nixon, of Nevada. After discussing Ely in eastern Nevada as a low-grade copper camp, he said of this wonderful newly discovered district in the west:

"The possibilities of much higher grade production in the Yerington and other districts should not be overlooked. Who shall say that even at present prices much profit cannot be had from copper mines?"

With the showing that the Nevada-Douglas mines at Yerington are making, it appears that copper will continue to be a good investment.

UBEHEBE COPPER MINES & SMELTER CO.

Ubehebe, Inyo County, California.

CAPITAL STOCK, \$3,000,000 (THREE MILLION SHARES AT \$1.00 PER SHARE)

JOHN SALSBERY
(President of the Tonopah Lumber Co.)
President and General Manager,
Tonopah, Nevada.

Baltimore, Md.

J. J. GRIFFITH,
Secretary and Treasurer,
Tonopah,
Nevada.

HISTORY OF THE UBEHEBE DISTRICT

FOR many years it has been known that the territory in Inyo County, California, adjacent to the Nevada-California line, had within its mountains immense deposits of copper, gold, and silver, but, on account of the inaccessibility of the region, mining men gave little attention to the fabulous wealth that lay deposited there.

With the building of the railroads through southern Nevada and the establishment of permanent towns throughout this section, attention was diverted to this hitherto unknown country, resulting in the entry of business men from all parts of the United States with strong financial backing, and the purchasing of properties that are producing many millions of dollars.

Ubehebe is one of the sections that has been receiving marked attention during the past few months from men foremost in the mining industry. It is located in the Butte range of mountains, near the

this section is the existence of veins of enormous width on the surface, carrying extraordinarily high values, many places showing the existence of sulphides, while impregnated throughout the ore is native copper.

Ore Bodies, Etc.—The Ubehebe Copper Mines & Smelter Company has within the confines of its holdings several very rich veins. The ore vein is very large, averaging over fifty feet in width, while at one point near the apex of Mt. Ubehebe it is one hundred and fifty feet in width. It traverses the entire length of the property for a distance of eight thousand feet, being exposed the whole distance. At another point this vein is opened by means of an open cut fifty-five feet across and ten feet deep, with a shaft down in the center to a depth of sixty-five feet, exposing good grade ore throughout the workings. Eighteen hundred feet below this large vein, near the base of the mountain, a tunnel run in one hundred and eighty feet has tapped a forty-foot ledge of sulphide ores, four feet of which averages better than fifty per cent copper, with considerable gold and silver values.

Ubehebe Mountain from the West

Nevada-California line, about forty-eight miles from Thorpe, a station on the Goldfield and Bullfrog Railroad, and is recognized by mining experts to have the largest deposits of copper ores of sensational values on the surface found anywhere in recent years.

Ubehebe was first discovered in the summer of 1906 by prospectors who had heard of the rich mineralized district through Indians, they having previously at different times brought into Keeler, California, large chunks of ore full of native copper, which they said they found on top of the ground.

Mr. John Salsbery, the Lumber King of Nevada, sent a number of men to the Ubehebe District over a year ago. This pioneer work resulted in Mr. Salsbery securing the very best ground in the district. On further investigation by Mr. Salsbery, the Ubehebe District appealed to him so greatly that he began to buy additional property until up to the present time he has made very large investments in this territory.

Mr. H. G. Merry, of Baltimore, a mining expert, formerly of Butte, Montana, became associated with Mr. Salsbery, and in the month of March, last year, these gentlemen made a thorough investigation of the Ubehebe District, and on finding the property so rich in copper, gold, and silver, they organized the Ubehebe Copper Mines & Smelter Company.

COMPANY'S HOLDINGS

The Ubehebe Copper Mines & Smelter Company was the first company to secure ground and to do active development in this district. The company has in its right title claims fully surveyed, the titles being perfect.

Formation.—The formation throughout this district is granite and lime, the granite showing wonderful strength, remarkable persistence and continuity. Where the gossan or iron has existed, the ore deposits have always been found by penetrating the capping. The feature of

Shafts, tunnels, and open cuts throughout this property have opened up bodies of ore exhibiting large deposits of exceedingly high values. Native copper, cuprite, and chalcocite are found existing in all the deposits in the property, while in many instances heavy sulphides have been exposed almost from the grass roots. In all the ores gold and silver are associated with the copper, and, at one point, a sample gave assay returns of fifteen hundred dollars per ton in gold.

Water, Fuel, Etc.—It is a rule that newly discovered camps must first seek water, fuel, and also transportation facilities. In the mountain ranges close by, millions of feet of timber are available for fuel and mining purposes, while close to the mine the company has water rights with a flow of water capable of meeting any necessary demand. A good road has been built between the mines and Thorpe, and a railroad projected, the line for which has been surveyed and steps taken looking towards its early construction.

Mine Operations.—The mining claims of the company are located so that a tunnel proposition presents the most economical method of mine operation. Development work has proven the existence of enormous copper-ore bodies, demonstrating that millions of tons of high-grade ore are available for extraction, treatment, and diversion into commercial channels.

One great feature of attractiveness about the Ubehebe property is the ease with which the ore can be taken from the mountain. It is entirely a tunnel proposition. There is no necessity of sinking shafts hundreds of feet below ore is concentrated. The ore is right there at night and can be taken from the earth with the greatest ease.

The Ubehebe Mine today is largely in the position of the Tonopah Mine before the Tonopah and Goldfield Railway was built. What Ubehebe needs to make it a great dividend earner from the start is a railroad of some 14 miles from Thorpe, Nevada, to the property. Negotiations are already started towards the building of this railroad line, even if this should be delayed through the present condition of the money market, investors in stock of the Ubehebe Copper Mines &

Simelter Company only have to be a little patient before they will reap a rich reward in the enhanced value of their stock through the sale of the high-grade ore which is now being sacked and carried to the railroad by the burros and mules. Ore that runs from \$50 to \$500 a ton can be shipped even in this way at a great profit.

A PERSONAL INSPECTION OF UBEHEBE

A member of our firm made a special trip to Tonopah, Nevada, in August, having been under an inspection of the Ubechebe District. The trip was made from Tonopah to the mine with Mr. Salberry and Mr. Ray Baker, manager of the Ubechebe mine. After arriving in Ubechebe, sufficient time was spent in going over the property to give it a most thorough inspection. It was found that the Ubechebe Mines & Smelter Company own practically a mountain of ore, consisting of over a 100 acres of mineral land. The ore bodies on Ubechebe Mountain are of the same size and character as the ore bodies on the Tonopah, as a rule, and there is one that exceeds 150 feet. These ore bodies run from the top of the mountain to its base. Shafts have been sunk all the way to demonstrate the continuity of the ore bodies; tunnels have been driven in on the sides of the mountain, proving beyond peradventure of a doubt the continuance of these ore bodies to the base of the mountain. There are simply hundreds of thousands of tons of high-grade ore on Ubechebe Mountain. The ore taken on this trip was shipped to Chicago on the way East, and the report of Dr. Charles B. Gibson, the assayer, 84 Clark Street, follows:

Laboratory No. 571			Sample Marked No. 1		
Gold		Silver			
Ozs. Per Ton.	Value.	Ozs. Per Ton.	Value.	Copper.	Total Value.
0.46	\$9.20	32.78	\$32.42	57.42	\$151.20

EASTERNERS INSPECT UREHERE

On October 26th last, a party of Eastern and Southern men made the trip to Ubeche on the private car "Ildwild," covering the distance between the terminus of the railway and Ubeche by automobile. These gentlemen made the inspection of Ubeche at a time when the worst of the financial disturbances were going on in New York—certainly not the most propitious time to view a mining property—but the enthusiasm of the party well repaid the effort of taking them to California. There were nineteen in this party, from Maryland, Pennsylvania, Virginia, and New York. They had an opportunity of critically inspecting the property, and the best evidence of their appreciation is expressed in the following letters:

"After a thorough personal examination of the properties of the Ubbelschke Copper Mine & Smelter Company of California, I am of the opinion that the company owns one of the most extensive and valuable deposits of copper ore in this country. The claim of the company extends from the bottom to the top of the Ubbelschke Mountain, at an elevation of about 6000 feet above sea level. It covers an area of about 100 acres. The principal veins of rich ore are found at all levels, shafts and tunnels at as many as six different places show immense bodies of ore. To estimate the value of this vast mountain of copper-ore is simply impossible—estimates of tons will not express in figures the extent of the deposit. It would require more than a hundred years to mine it. The amount of by-product could not be exhausted in one hundred years. The company is capitalized at a very low basis considering the value of its property. Its management is in the hands of progressive and honorable men, who are interested in the commercial development to a dis-

* Every condition for a profitable enterprise and for rich earnings seems to me to be present. In addition to the copper, the ore carries enough gold and silver to pay all cost of reduction. The property is located in a section of country where transportation, mining and smelting can be conducted on an economical basis.

"The property owned by the Ubelake Mines & Smelter Company I consider wonderful. I believe they have nothing of kind of copper ore at night. My friends whom I have taken to see the property all agree with me that this is one of the most valuable copper mines ever found."

—Garrison, Va., Nov. 18, 1891. E. G. HANCOCK.

"I have been most favorably impressed with my Western trip, and can say that the most vivid recollection cannot suggest the possibilities of that country. Turkestan and Uzbekistan in reality great oases situated in the midst of a vast desert, a few years ago would have been considered absolutely unpopulated wildernesses. The discovery of gold alone offers the explanation. To-day to develop the Uzbek District, with its mineral wealth exposed and its natural resources at hand, is to speak presents but few mental

The mineral wealth in Ubechele property, both by its vastness and richness, is amazing—the supply seems inexhaustible. The average percentage in the ore is unusually high as compared with the larger copper mines of the country, while the gold percentage is equal to that of the largest gold-producing mines in the Nevada camps. I have reference to the Tonopah Mines of Tonopah, Nevada. The gold ore of these mines averages between \$40 and \$45 per ton.

^cPhiladelphia, November 19, 1987. HARRY J. GRY, M.D.

"I visited the Ubeleshe Copper property with nineteen others on August 19, 1907, from Vancouver and Toronto, and as far as I could learn the property showed up far better than any exposed to date in the Northwest.

"We ascended all the different outcroppings. There seem to be several veins or contacts from 15 feet to 100 feet in width cutting together at the foot of the Ubeleshe Mountains, on the eastern side of the mountain, and dipping to the west at an angle of 30° to 40°.

"There were many more the mountain and down the other side to the plain below, a distance of 200 feet perpendicular. The vein has been tapped in a number of places by running into the mountain, all showing rich copper. The veins are from 10 to 20 feet in width, and are made of the same native copper. There have been shafts, tunnels, and open cuts made from the base of the mountain for a distance of eight or ten thousand feet, and the mountain is well all of which show rich copper. The same ore that yielded 20 per cent copper.

After two trips to the property, having thoroughly examined it from present price to those not seeking an overnight investment. The Ubeho of Copper, Gold and Silver. It will take time to develop such a proposal reward worth waiting for.

MEMBERS BALTIMORE STOCK EXCHANGE PEARD, H

"From all the openings I examined, I should say the whole would make a high average. I had heard a great deal about Ubbelohde before I went there, and must admit it was not overestimated. It is a property that must be seen to be appreciated."
"Really, I am perfectly sure in moving another I, not my children, nor my children's children, will give me no chance."
"We passed over one of the proposed routes for a railroad, by automobile, from Bonnie Claire to the mine, and I saw no obstacle in the way of building a road."
—NATHANIEL HAWTHORNE—

¹Toronto, December 3, 1907.

While our opinion of the property more than coincided with the reports of various men of experience who visited the mines, we felt it was only right to our clients, before offering the stock of the Ubechee Copper Mines & Smelter Company that we should have additional evidence from practical men of mining experience. We therefore called on Mr. J. M. Smith, President of the Roanoke Rye Dantling Company, Baltimore, to go to Ubechee as a mining engineer. Young Mr. Gambrell left for the mines on August 26th, and his report, which follows, confirms all previous statements concerning the remarkable richness of the ore bodies. There is no doubt that the Ubechee property is one of the most important gigantic property, which, with its acreage and enormous deposits, will, through inexhaustible, provides a wealth of minerals that insure sufficient income from gold and silver, entirely irrespective of copper, to make the mining of this ore possible; but, when it is considered that the Ubechee property is one of the largest and most valuable property temporarily, the value of the Ubechee ore deposits seem immeasurable.

REPORT OF MR. GEORGE T. GAMBRILL, L. E. M.

On the Ubehebe Copper Mines & Smelter Co.

The above property, consisting of about 2000 acres, is located in the east central part of California, in Inyo County.

Topography.—Consists of rugged mountains, peaks and high slopes. The nearest water is at present at Marys Springs, about eight miles northeast, and Dodd's Springs, about ten miles south. A well is being sunk about a mile from the present town site, and water should be had within a few hundred feet.

Geology.—The country rock consists of lime and granite, the mineral occurring between the above. From all indications, there has been an upheaval, the granite having been lifted through the lime. The contact is regular and may be traced and readily seen from one end to the other of the entire property. For a good contact, I do not believe the Ulichie property can be surpassed.

Timber.—There is no timber or vegetation on the property, but any amount may be obtained on Tin Mountain, about eight miles northeast from Ulshebe.

Ore Bodies.—Outcrops are distinctly seen almost any place over the full length of the property, and where development work has been done one may readily see that there are large bodies of ore in sight. On the Meare property a tunnel has been driven about ninety feet. The copper shows up here as copper glance running high in copper.

The surface outcrops on all the claims show up as Caprite, Chrysocolla, Chalcocite, and Malachite, with some azurite, thus showing there are sulphide bodies in depth, the copper having been leached out near the surface. In some places native copper is found. All of these copper occurrences show good values in gold and silver. At the Moana the vein may be traced up the entire side of the mountain, dipping at about eighty degrees west.

On the Star, south of the Mears and about 2000 feet higher in elevation, the vein has been opened to fifty feet in width; this is not, however, its entire width, as outcrops of the same structure and composition are found on either side. The ore occurs as Chrysocolla and Carbonates, with some traces of sulphides. A shaft has been sunk about sixty-five feet, showing up five bodies of copper rock, gradually gaining more sulphides. The sand vein dips about seventy-five to eighty degrees northeast and strikes northeast.

The Tip Top, which is a little farther south shows the same composition and structure, and is the same level, and a point worthy of note is that the extension south has penetrated the ore and with a rather more thorough-

Surrounding Country—The surrounding country is highly mineralized and auriferous than the scratched area. One could not find a district where all the minerals occur.

Many properties are now under way, and steady work, judging from what the companies say, will be begun when the railroad is put through, which is expected in a short time. There is no doubt that a railroad would have all the business that it could do, and that a smaller would make good profits in Utah.

Mining.—The necessary mining would require very little timbering, judging from the structure of the rock. This would lessen the cost to a certain extent. Also the plan of running a tunnel from the east side to cut the Tip Top at about 100 feet would reduce the expense, as this is without question the cheapest way to mine. Assessment work is being done at present, but as soon as the machinery arrives, within a few weeks, the tunnel is to be opened.

Town Site—A town site is being completed, consisting of about three thousand lots—a more suitable location could hardly be found in the State.

Climate.—The climate is very healthful, though rather warm in summer, there is no humidity, being very clear and dry.

Transportation.--At present Ulshebe is reached by wagon or automobile from Montana Station, a stage line is going to be run shortly, and Ulshebe is to have a post office. The railroad, as before said, is to be built shortly between Ulshebe and the above-mentioned station.

Remarks.—The Uchebe has without doubt wonderful copper showings, and the surface outcrops I do not believe could be surpassed anywhere. A tunnel run from the east end through the Uchebe will develop it about 1 mile to the east, and the probable ore bodies could be exposed, and it is here that I believe to be the largest and main deposits.

In conclusion, I may honestly say that I believe that any one who may look over the property will concede in saying that if the Uchebe is properly worked it will be one of the **Largest and Most Profitable Camps in the History of Copper**, as there is (from all indications) an unlimited amount of this ore, as well as large deposits of gold and silver.

On every standpoint, we have no hesitation in recommending the stock at its property consists of over one thousand acres, practically a solid mountain range, but to the stockholders who are patient will, in our judgment, come to believe, present prices of the stock, etc.

L & CO. 212 E. GERMAN STREET
BALTIMORE, MARYLAND

Seven Troughs—Nevada

By O. H. Tibbitts

THE Seven Troughs District is located in Humboldt County, Nevada, about thirty miles north of Lovelock Station on the Southern Pacific Railway. The mineral belt extends from Vermont on the southwest to Stone House or Farrell on the northeast, a distance of about ten miles, and is folded volcanics on the flank of a granite uplift to the west and north, while south and east the older slates appear backed up by granitic peaks.

The rocks are principally rhyolites, breccias, porphyries, and occasional showings of andesites. Prevailing these flow rocks is a series of basic rocks of a basaltic nature, and it is along these dikes and in the porphyry that the ore veins occur.

The dikes and veins all have a strike north about fifteen east, with a dip to the westward varying from nearly vertical to forty or fifty degrees.

The ore is nearly every instance carries both gold and silver, in about equal quantities—that is, one ounce of gold to each ounce of silver.

This district may be said to be in its infancy, from a mining standpoint, but enough work has been done on various properties to demonstrate that it is a locality of wonderful richness and great possibilities.

The veins are true and continuous, increasing in both size and value as depth is attained, and at least in one instance, "The Fairview," at 300 feet of depth, the sulphides have appeared and the values built.

The "Mazuma Hill," "Theriac," "Thor," "Fine Gold," "Kindergarten," "Signal Peak," "Fairview," and others, are already justly regarded as great mines, for while comparatively little work has been done, the showings are something wonderful. The values are marvellous, and it is not uncommon to see ore that will run from \$20,000 to \$100,000 per ton, while face samples run well up into the hundreds.

I consider this district one of unusual promise, and do not hesitate to assert that in a few months it will be recognized as one of the leading producing camps of Nevada.

The "Tom Boy" group consists of seven claims and fractions of claims, aggregating about 110 acres, and has been surveyed for patent, there being no adverse. The claims are as follows: Tom Boy No. 1, Tom Boy, Tom Boy No. 2, Tom Boy No. 3, Grinose, Grinose Fraction, Grinose No. 1.

The ground is advantageously located on the north side of Seven Troughs Gulch, and carries the porphyry and siliceous dikes indicating the lines of mineralization, and should prove to be a good property.

The "Grinose" claims adjoin the "Fine Gold," and will carry the dikes and contacts of the "Fine Gold" and "Kindergarten" claims, while the "Tom Boy" claims will carry the ore mass of the "Budger" and "Thor" veins.

The country is extensively forested, and it is likely that crosscutting will hasten the existence of many veins not now known.

At the date of my visit traveling had just been started along the various lines of contact to determine the vein fields, and while on large showings of base anode, the surface dirt both upon the "Tom Boy" and "Grinose No. 1" showed some fair payables. There is as yet, however, no chance to do systematic sampling.

I suggest a continuance of this traveling along the contacts until it is determined where are the most available places to sink, but that the permanent development work be projected from Seven Troughs Gulch on the Grinose Fraction, where one can gain 500 feet of depth with from 700 to 800 feet of driving. This work should not be started, however, until the preliminary surface exploration has been completed, indicating the most favorable zone for your crosscut work.

In closing I wish to emphasize the statement that I consider Seven Troughs the most promising camp it has ever been with my pleasure in visit, and as the property is favorably located I believe that well-directed exploration will prove it to be valuable ground.

The Whole World Knows

who have made fortunes in Wonder and Goldfield,

BUT

who can tell who the next are to be?

YOU

can be one of them, if you buy the better class of stocks. We will be glad to aid you in selecting these stocks, if you so request. We never recommend a stock without first knowing thoroughly all that is necessary from the investors' standpoint.

GRAY MOTORS

THE RHYOLITE BULLFROG MINING COMPANY

(A Nevada Corporation)

Owens 4 full claims or 80 acres on Red Mountain, 6 miles southwest of Rhyolite, in the Bullfrog Mining District, Nye County, Nevada. This company is incorporated for 1,000,000 shares, par value \$1.00, with 500,000 shares in the treasury.

We are now offering 50,000 shares of treasury stock at 15c. per share in order to purchase hoist and compressor plant and continue active development.

The vein is uncovered on the surface for a length of 1500 feet, and ranges from 2 to 10 feet in width. That portion of the vein where the present work is being done is situated on the Angelina claim at the point where we found the highest average values.

Herewith we give extract of report from our Superintendent for the month of October:

Work up to date consists of sinking 68 feet (shaft was down 10 feet), shaft was timbered, square sets and partially lagged for the first 30 feet, 4x6 feet in the clear; the hanging wall for the balance of the distance was made secure, where necessary, by stulls and headboards.

The vein striking North 78° West was followed on its 50° dip (to the Northeast), and is composed of a crushed, altered, silicified brecciated rhyolite, with a foot-wall, a dark bluish, and hanging wall, a light-gray rhyolite, well defined.

The vein averages close to 3½ to 4 feet wide, and the following samples were taken:

Number of Sample	Width of Sample	Where Taken	Silver	Gold	Value
1	2'-2"	25' down on east end of shaft		\$4 40	\$4 40
2	3'-6"	45' 6" down across both ends of shaft		40	40
3	From Orifice	63' 6" down centre of hanging wall		2 00	2 00
4	3'-8"	63' 6" down across east end of shaft	\$1 22	10 00	11 22
5	3'-6"	Same depth as No. 4 West end	1 46	22 00	23 46
6	2'	East end of shaft 40 feet	1 09	8 80	9 89
7	2'-2"	West end of shaft 50 feet	97	9 60	10 57
8	3'	Same place as No. 4	1 22	4 40	5 62
9	3'	Same place as No. 5	1 70	14 00	15 70
10	21"	Both ends of shaft 78 feet	2 43	16 00	18 43

OSWALD STEIN, Superintendent.

The above showings, increasing as they do with depth, give every promise of making a mine, as all properties in this district that have developed into mines have started with small values at the surface.

The control of the property is owned by Nevada mining men, who are operating the mine along economic lines and are not manipulating the stocks.

Inspection and sampling of this property is invited by all investors, and all statements made by the management are guaranteed to be correct.

Bulletin.

THE FORTY BEACHES OF NEW JERSEY.

The one hundred and twenty-five odd miles along the New Jersey coast line from Long Branch to Cape May presents the greatest pleasure section in the United States.

Upon the bluffs of the northern end and the gently shelving sands of the southern end are located forty resorts which entertain during the spring and summer season multitudes of pleasure seekers.

At no time in the year is this section more delightful than during the spring and early summer months. One who has not seen them at this season would marvel at their delights. The great pine belt, which extends through the centre of New Jersey, fills the air with life-giving, cooling, which, combined with the salty taint of the sea and the open-air exercise possible at all times, is exhilarating and tonic to the highest degree.

Long Branch, with its beautiful cottage-neighbors, West End, Hollywood, and Elberon; Deal and Allenhurst, largely devoted to estate life; Ashbury Park and Ocean Grove, attracting thousands yearly; Avon, Belmar, Como, Spring Lake, and Sea Girt, are a galaxy of attractive places upon the bluffs where "the country meets the sea."

Then the Barnegat Bay section, where Point Pleasant, Sea Side Park, Island Heights, Barnegat City, and Beach Haven, with other smaller places near by, welcome the summer sojourner.

Atlantic City, with its seven miles of beach and drives, and its charming suburbs, leads the island resorts, separated from the mainland by the great salt marshes.

Ocean City, Sea Isle City, Avalon, and Stone Harbor, Angelsea, Wildwood, Holly Beach, and Wildwood Crest also have a large summer population.

And Cape May, with its new million-dollar hotel and its wonderful improvements, makes a fitting climax and holds a high place among the forty beaches.

The Pennsylvania Railroad is the direct route to all of these resorts from all sections of the country. Its splendid train service makes each of them neighborly to all the rest and to the world at large.

HOTEL DENNIS

COMMENT

Enough Said Already

WILL MR. ROOSEVELT reply: "If I am elected I will not serve?"—*The Sun*.

Probably he will not. Why should he? Why should he discredit the efficiency of his existing declarations by adding to them useless words? He can't be President again without being a candidate for President. He has said that he would not again be a candidate or accept a nomination. That is enough. More words or any different form of words on the subject would avail nothing. Folks who do not believe what he has said would not believe anything he could say.

Let a Good Thing Alone

Our valued contemporary the Princeton (Minnesota) *Union* comes at us with reproaches, as follows:

Because Mr. BRYAN realized \$52,000 last year from his lectures he is caricatured by HARPER'S WEEKLY as a bloated plutocrat. It takes more than the average amount of brains to make \$52,000 a year on the lecture platform, and Mr. BRYAN possesses it. HARPER'S aim is seemingly to rub the achievements, and seeks to insinuate that he did not give value received; but the truth is that the Nebraska well earned that sum by a combination of ability and strenuous work, and the people who listened to his discourses received their money's worth.

Whatever he made, he earned it all. He is a man of platform talent; a remarkable speaker, a lecturer whom folks gladly pay to hear. We guess he is the best man in the lecture business to-day, and excepting Senator TILLMAN. And does our Northern-sterne neighbor impute it to the WEEKLY as a fault that it wants to keep Mr. BRYAN active in a field where he is master rather than subject him to the blight of a Presidential nomination? Why spoil a strong lecturer to make a weak candidate?

Know a Little Law

A little knowledge of what the law actually is is a very suitable part of the equipment of any person who aspires to be a leader of men and a maker of new laws. Mr. ROBERT HUNTER was one of the promoters of the socialist mass meeting in Union Square on March 28 which was dispersed by the police and punctuated by a bomb. Mr. HUNTER protested that the right to hold mass meetings was protected in the Constitution of the State, and that the police had no right to interfere with it. So it is protected, with some necessary and constitutional limitations in the penal code. But the Constitution gives no one the right to assemble on the premises of an unconsenting owner. The city, represented by the Park Department, is the owner of the park, including Union Square, and with a permission to assemble there was asked by Mr. HUNTER's friends it was refused, not wisely, perhaps, but at least legally. That inside the meeting took place, and the attempt to hold it was necessarily frustrated by the police,

Mr. HUNTER in his remonstrances seemed quite unaware what law governed the situation.

A Continuing Controversy

Addressing the order of Railway Conductors in Chicago, Secretary TART said:

There is no denying the fact that we must look forward to a gigantic controversy between labor and capital, hoping and trusting that it will be settled peacefully. That controversy when it comes will divide once for all how capital and labor shall share the joint profits which they create.

The controversy the Secretary speaks of is as old as history, is going on all the time, and is likely to continue as long as civilized society remains on the earth. It is more acute sometimes than at other times; possibly a worse than usual ebullition of it is now ahead. SYLVIA GORMAN may think so when he threatens the country with seven labor organizations bound by oath if Congress does not amend the SHERMAN law to suit him. But that any particular outburst of that controversy will settle "once for all" how capital and labor shall divide seems very unlikely. Perhaps the Judge was misquoted. The law of supply and demand can be thwarted in various ways, and can be modified, but it is hard to beat it in the long run.

Still Speculative, but Unlikely

TILLMAN says BRYAN has said too much in favor of ROOSEVELT and his policies to run against him. Well, he won't have to. Nobody is going to run against ROOSEVELT. That is settled. It isn't quite settled yet whether any one will run against BRYAN, but we guess not.

The Turk and His Habits

If the Turk is a sensitive man and an extensive reader of current American newspapers, his feelings are liable to be hurt. Persons who still venture to argue in gentle disparagement of complete prohibition are prone to point to the Turk and say: "There is an example of successful prohibition! Just look at him!" And then the defenders of tobacco, when they have chance to meet, say: "There's the Turk. He smokes all the time, and keeps remarkably healthy under it."

It doesn't seem quite fair that the Turk should prove that tobacco is comparatively harmless because he smokes it incessantly, and that rum can't be quite so bad as represented because he never drinks it. No doubt the truth is that tobacco habituates to some degree the restlessness of human energy, and contributes to the Turk's healthy temper. Possibly, also, alcohol drives nations that use it, both by its direct effect as a stimulant and indirectly by offering a danger to be overcome. The energy and discretion developed in keeping alcohol in its place may have an effect on a nation comparable to the effect of warlike neighbors. It is developing to have to stand on guard, and doubtless exerting to be too much shielded and protected.

The Strength of Strong Families

Sundry divorce suits and remarriage propositions that take up space in the papers just now illustrate that it makes less difference how much money a man leaves behind him than in what hands he leaves it. To leave abundant means, in foolish hands is failure. To leave wise children in the world is success, and if they can be left in a position of fiscal advantage, so much the better. To found a good family, or give good human stock a lift, and put it in a position of enlarged opportunity and increased power, is a work that is legitimately attractive. But it is the human stuff that is important. What every country needs is families that will breed true to high standards and give superior individuals to the service of the world. We have such families, that generation after generation turn out high-class men and women. Every progressive country has, and must have, such families. Whether at a given time they are rich or not is a matter of secondary importance. If the human material is strong and good, money in sufficient quantity will come to it first or last. If the human stock is inferior, immoral, or ill trained, money dumped upon it will merely advertise its inferiority.

Property Rights in Texas

ALDEN C. GERALD, Governor of Texas is a candidate for reelection. He finds him from a charge of improper conduct in receiving a hundred dollars a month from a law firm

of which he was a member before he took office, the Houston *Chronicle* says that that is all right; that he had an equity in the business of his former firm, and that when he retired his partners arranged with him a basis for the payment of that equity.

The Attorney General has no longer any part in the practice of the firm. He is now paid only for a property right that he created in the period before he quit the firm. To deny his right to receive such payment is equivalent to denying the reader's right to build a house and take monthly rental for it.

But in the same column it bids the people of Texas remember that the issue in the current campaign is, "Shall the money power rule, or shall the people rule?" But if a "reader" has a right to build a house and take rental for it, is not that a bare concession to the money power? To admit that, would seem to necessitate admission that folks who build railroads or anything else in Texas have property rights, and that is contrary to prevailing opinion in Texas as we understand it. Perhaps the Texas plan is to preserve the property rights of "readers" and residents, while absorbing those of non-residents.

The Sequestration of the Asphalt Lake

A few weeks ago the Senate called upon the President for the transmission of all documents and correspondence concerning the five claims of citizens of the United States against Venezuela. The President has complied, and after due consideration it will be for the Senate to make the next move in the game with CARMAO CARRERA, who has finally worn out the patience of our State Department after several years of insistence on its part that the claims be submitted to arbitration. This is the story: In 1903 fifty-five claims of American citizens against Venezuela were arbitrated by a mixed commission. Since then fifty-three of these have been heard of no more; but the other two have in part been reasserted by the claimants and supported by the United States government, one on the ground that the question of its validity was not decided, the other on the ground that it was erroneously disallowed. Three other existing claims originated after 1903. Of these the most notorious is that of the New York and Bermudez Company. In 1883 Venezuela made a conditional concession of the right to exploit asphalt in the state of Bermudez to one HENRY R. HAMILTON, a citizen of the United States. This right soon passed to the New York and Bermudez Company, which, in 1888, in order to render its position more secure, obtained from Venezuela two additional and more specific concessions, namely, the right to exploit on asphalt lake and a full proprietary title to the lands about the lake—the lake and the lands, be it understood, both lying within the state of Bermudez. After 1888 the New York and Bermudez concern sagged with other companies, passed along with the rest of the so-called "trust" into the hands of receivers in 1901, and finally appeared in 1902 as a member of the General Asphalt Company, of which Mr. JOHN M. MUCK is president. Not long afterward the trouble began. In 1904 President CASTRO sequestered the asphalt lake on the ground that the New York and Bermudez Company had not fulfilled the conditions of the HAMILTON concession, and subsequently this concession, but neither of the two of 1888, was declared void by the High Federal Court of Venezuela. Since then President CASTRO and Mr. AMEL L. BARNES appear to have shared the profits from asphalt exploitation in the state of Bermudez to the exclusion of the General Asphalt Company. If we may believe one of the most important documents transmitted to the Senate, the CARROLL report, neither of these gentlemen is within his rights.

The All-Kite Ticket

FRANK SANDOZ'S "winning Presidential ticket" (which, he complains in one of his weekly letters to the Springfield *Republican*, does not draw out much response) is "BRYAN for President and ROOSEVELT for Vice." Its strong points, as he expounds them, are that it would debate the dangers of a third-term campaign, and put ROOSEVELT in the chair of the Senate, where he could harness his Senatorial obstructions, and where he would be relieved of the obligation to send in messages and make speeches. But Mr. SANDOZ hardly expects his ticket to be accepted, and, true enough, it is not promising. A ticket ought not to be all kite and

no tail. The SANDOZ ticket would flop mightily, but would hardly fly.

A Professional Southerner

The Nashville *Banner* calls Representative HEPBURN "one of those professional Southerners who seek to make display of supposed Southern traits when in Northern localities." The Louisville *Courier-Journal* thinks that Mr. HEPBURN, when his temperature drops, will find that his efforts to police the national capital have been unprofitable.

More Light in the Armor Belt Controversy

It looks as if GABRIEL WELCH's policy of being the thirteenth at table had not appealed to the Senate Committee on Naval Affairs. At any rate, they have avoided giving an ignorant public the impression that they had cause to discredit the Navy Department, in that they have refused to accept or publish certain evidence presented to them during their recent investigation into the alleged structural defects of our battleships. But, as was inevitable, the evidence in question has leaked out through unofficial channels, with the result that it has been partly published and considerably misinterpreted in the daily press. In particular has this been true of Admiral EVANS's statement of last summer, that "in the case of armored ships their armor belt is practically awash at load draught, which leaves them, so far as protection is concerned, but little better than unarmored cruisers." One newspaper understands by this that Admiral EVANS has stated that our battleships are "left, so far as protection is concerned, but little better off than unarmored cruisers." This interpretation disregards the qualification: "at load draught." "At load draught," and "at load draught" only, did the Admiral say his fleet was thus inferiorly protected. But would this fleet fight at such a draught? It is improbable. However, in view of the report of the Admiral, sent to the Navy Department from Magdalen Bay, this has become a secondary question. In the report it is submitted that in the event of war the load draught of the battleships could be so far decreased by the removal of superfluous structural work that their belts would rise the necessary height above water; but it is further observed that during the cruise about South America, "even when heavily laden" is "smooth to moderate seas," the battleships "frequently exposed their entire belt and their bottom plating beneath." As the belts of our battleships are but from eight to nine feet in width, and Admiral EVANS evidently by "heavily laden" means "at load draught," this is the same as saying that eight or nine feet of armor is needed below the water-line. One can but conclude from this that our battleships, no matter what their draught, have belts too narrow to afford them adequate protection both above and below water. However, there is some consolation to be derived from this revelation, for most foreign battleships have even narrower belts than their American contemporaries. For example, the belt of the Japanese battleship *Kashima* from top to bottom measures eighteen inches less than the belt of the *Vermont*. Whence it is evident that in so far as concerns protection below the water-line—and quite possibly above it also—the American vessel can be trimmed to fight at an advantage. Yet Mr. ROOSEVELT would have us believe that she is as much a coffin ship because of her belting as any one of the unfortunate vessels under the command of ROOSEVTSKY.

Harsh Language

The New York *Sun* and other unpatriotic journals.—*The Outlook*. Tut! tut! Brothers AMORY and MUMF! If Brother LARSEN should designate you as "unpatriotic," you would want, and would be entitled to receive, a bill of particulars. It strikes us as an unjustifiable term—also most nagpety.

Expert Mayors

We know how they make mayors here, and we also know the kind of material we have for the making, and the output. How do they make them in an empire the head of which is pretty much of a dreg? One bit of knowledge is somewhat familiar. The Germans have better and cheaper municipal governments than we have. Counsel-General TRUBNER of Berlin has told us how the mayors are chosen. Like postmasters, generals, ambassadors, and collectors in Great

Britain, these German mayors belong to a permanent graded service. The Mayor of Berlin, for example, is not a citizen of that town necessarily; indeed, as a rule, he comes from some other place, and has served successfully as a mayor at some smaller city. He has become an adept in his business, and he is chosen by the town council from among German mayors. The town council does not consist of citizens who, if they were aldermen of New York, would vote for ARKERS. They are respectable men and good citizens, and the interests of the city are the only interests with which they are officially concerned. They are elected by the taxpayers, who are divided into three classes according to the amount of taxes they pay. Each class chooses an equal number of councillors, although they differ from one another in numbers. These highly respectable and dutiful citizens choose the Mayor, who may serve for many years. He is elected for twelve years and may be re-elected. If he serves one term, he retires with a life pension equal to one-half of his salary; if he serves for twenty years, his pension is two-thirds of his salary. They have great confidence in experts in Germany, quite as great as we have in amateurs, and perhaps with as good reason. So far as municipal business is concerned, the Germans are a good people to swap ideas with.

The Playground Association's Dinner

Two important problems were treated, one directly, the other indirectly, by the ladies who shared in the after-dinner speaking at the annual dinner of the Playground Association of America, on March 31, in New York. The guest of honor at the dinner was Mrs. HUMPHRY WARD. A number of ladies spoke, among them Mrs. WARD, the Duchess of Marlborough, and Miss JANE ANDAMS, of Chicago. They all talked about the need of giving city children a chance to play in wholesome fashion out of school hours. Mrs. WARD told how London nibbled at the problem; Miss ANDAMS told how imperfectly Chicago dealt with it. The duchess, who was called upon first, took a wider range, telling about the public work done in England by women, whose influence, she said, had "permeated every field of endeavor, political and philanthropic, no less than social and artistic." From earliest childhood, she said, English women are made to feel the obligations of individual responsibility. "It is in this sense of obligation," she said, "that I venture to think we American women should foster and develop, recognizing it in its ethical basis, and turning it to account in practical works." She went on to speak of the Playground Association, of the executive capability shown by American women in the management of hospitals and charities, and of the importance that many more of them should develop in the sense of personal obligation to the community, and interest themselves in educational and philanthropic work.

A Sound Example Handsomely Set

All of which is true and proper for the occasion. Still more important was the indirect value of the speaker's appearance and address on such an occasion, as an example of a useful employment for those American women who have not much to do and a vast deal to do with it. It is the reproach of the women of the rich and powerful American families that have developed in such number and such fiscal and social strength in the last quarter century that too many, though not all, of them are either unemployed, or employed in matters of trivial consequence. They are an enormously advertised lot of women; every newspaper reader knows more or less about them, and they have come to have something recognizable as social rank. But obligations go with rank, and they should try to shoulder theirs. The young duchess, who is one of them, has certainly tried to discover her obligations and perform them, and in that particular she has set an honorable example, worth all the publicity that can be given it.

The Bromley Lectures

The Bromley Lectures on "Journalism, Politics, and the University," delivered at Yale University by the editor of this journal, have been printed in convenient form, along with some of the press comments thereon. Any one caring to see a copy can get it by sending his name and address to this office.

Will There Be Another Morocco Conference?

AGREEMENT for the moment it is desired, we should not be surprised if, in the end, there should prove to be solid foundation for the recent report that the French government will soon feel constrained to denounce, in conjunction with its British and Russian friends, the Algeiras convention, and to propose either a reconsideration of the Moroccan question in a new international conference, or the submission of that question to the Hague tribunal. With comparatively little assistance from Spain, her avowed coadjutor, France has been occupied for many months in the task of restoring order in Morocco, and the work has cost her a considerable loss of life, as well as a great deal of money. She has no prospect of obtaining pecuniary compensation from the reigning Sultan, ABDUL AZIZ, and her reward for the services rendered by her to the cause of civilization in northwestern Africa must inevitably take the form of territorial acquisitions. No such acquisitions can be made under the terms of the Algeiras convention, and, consequently, it may seem reasonable to ask that the convention should be superseded by a more equitable arrangement.

We say that the work undertaken by France, almost single-handed, in Morocco has been performed, because although Fez, the northern capital, as well as the city of Morocco, which is the southern capital, are still in the hands of MUJAI RABID, the so-called Sultan of the south, the authority of the recognized ruler, ABDUL AZIZ, is acknowledged in all of the coast towns, and thanks to some advances of money made to him through the good offices of the French government, he has been enabled to keep in the field a considerable military force, whereas his rival's adherents, having been beaten repeatedly by the French expeditionary corps under General D'AMAR, are said to have dispersed, and it is further alleged that MUJAI RABID himself has made overtures of peace to the French commander. It is, therefore, quite on the cards that at no distant date the cities of Fez and Morocco may renew professions of allegiance to their lawful sovereign. Thereafter the plan which was agreed at Algeiras for maintaining order in the coast towns by means of a Moorish police force commanded by French and Spanish officers under a Swiss inspector-general might, apparently, be carried out without much difficulty. But how are the losses and disbursements of France in the cause of order to be made good? Assuredly the laborer is worthy of his hire. Unfortunately, the legitimate ruler of Morocco, ABDUL AZIZ, has no money, and is at this moment subsisting on French bounty. He has lands, however, and the addition of a considerable frontier strip to Algeria might be accepted as an equivalent for the sacrifices made by France. But so such territorial cession can be made so long as the Algeiras convention is regarded by the signatories as binding.

It is clear, then, that a new situation has arisen in Northwest Africa, not contemplated by the conference at Algeiras; a situation of which the French Republic will be the victim, unless it is to be reimbursed in one way or another for its outlays. That is a truth which even the Emperor WILLIAM cannot dispute, reluctant as he may be to witness a considerable expansion of Algeria toward the west. We repeat, therefore, that, although the report first printed in the *Times* of Paris may fall for the moment to receive official disavowment, we deem it probable that negotiations looking to a re-settlement of the Moroccan question will soon be on foot.

Garden Philosophy

WHEN the cook braves inclemently, when the hamper of meat fails to arrive by the only train from town, when the housemaid conceives a dislike to cut-glass and TIFFANY vases, and resorts to daily smashing, when you ponder about your house with murder in your mind, then, said a lady who knew, tie up some vines and roses, or dig about with a trowel a bit, and the fure of the world changes.

There is nothing truer than that a house and needlework lead to melancholy, irritability, and narrow-mindedness. There is something in the shut-in atmosphere, the endless, petty repetitions, the mere mechanical dexterity demanded by such pursuits that contracts both heart and mind, and freedom comes with the opening of doors and windows; hopes and fancies long pent up break loose and flow like the swollen spate of springtime. The free air, the open sky, the wide range of the eye, the bright alone, the unlimited depths beneath into which to dig, all these free the soul from the petty businessness of life, and set the blood to coursing; we draw in a long breath of fresh air and new courage, and all our relations to the cosmic forces are readjusted.

Every one who owns a spot of earth pines in the natural course of events for a large garden, and who attains such blessedness must bear the brunt of it since he, at any rate, has what he wanted. But the owners of very small gardens may solace themselves by doing all the work of their gardens in person, and that is a great gain in itself, ridding one, as it does, of the fretting coarct of other personalities and opinions. Then there is the intimacy of a small garden, a boon not really overrated. One may indeed gain

masses of color and large effect by planting by the thousand, but in planting by the half hundred or the dozen one establishes a personal friendship with each separate plant; one knows the faces of the pansies, the exact height of the delphiniums, and the bushiness of the phlox. In a very short time, indeed, may such a relation be established in a tiny garden as resulted in the poet's finer sense of things:

"The Red Rose cries, 'She is near! she is near!'
And the White Rose weeps, 'She is late!'
The Larkspur lingers, 'I hear! I hear!'
And the Lily whispers, 'I wait!'"

It was doubtless merely the exuberance of filiation that led the larkspur to linger in that case, for in the main he is an active and aspiring plant, reminding one, as he overtops the gentle Madonna lilies and waves over bushy phloxes, somewhat of an assertive rising democracy still proud of its peasant's blouse. And how like life, after all, is a garden, and what excellent discipline and training it is for general existence! Gardening, indeed, often leaves youth impatient, unwilling to have such obvious morals pointed at it, and keeping ever somewhere hidden in the depths of its glowering vitality a tiny, secret hope of the miraculous, a faint expectation that the order of the universe will, after all, reverse its course, and come about somehow in favor of the personal hopes. It was in the very youth of the world that the kings of Mexico were at their coronation, to swear to keep all the laws of the land, and *swear the sun confine his daily career*. It is somewhat funny and rather homesick that a garden teaches, what you sow, that you shall reap; and the wisdom, the richness of life, is to hitch your wagon and all your efforts to a star, for in the wake of the curves of the universe you shall go wildly nilly, and it is much better to go with heavy ascent, making the best of the matter, whether it be good or evil. Then, again, the garden, like life, is never "all we have hoped and willed and dreamed of good." Here, too, we must postpone fulfillment into the dim future, and look forward to next year, but next for the completion of happiness. It is never this year, but next, that the hollyhocks will be properly grouped and thick enough, that the foxgloves will have attained the proper height, and the dark blue columbines be near the white lilies and the cerulean columbines on the side of the spotted ones. Indeed, a harkly garden border is a perennial game of chess, where year by year we move and replant to attain better combinations of color, more perfect gradations of height. The garden is the eternal approximation; it keeps us up and doing, ever pursuing the still fleeting ideal.

And yet what a comfort, what a restful matter it is, after all, to find that each year we are moving a step nearer the goal; that the bare corner of last year is this year decorated in swaying color; that as the spring months lengthen day by day the garden takes on something of the undulatory and variableness of human nature itself, unexpected charm and color coming to the birth by the quiet process of the seasons.

One of the haunting regrets, when one sits on the bench in the pergola under the wistaria vine, is that MONTAIGNE did not write about gardens and flowers. Living as he did among "equestrian, vine-crowned towers, smiling over a little, irregular village, itself half hidden in gauding vines," he should have turned his ample, impartial gaze from the rows on rows of folk, and his memory from the doings of Greek and Roman heroes, to the fat, vine-clad undulations beyond, and have discoursed to us in his rambling, genial way about these same vines and hedges. He had come, by his own confession, to that stage in life when gardening and philosophy are the main props of existence.

"It is not long since I retired myself unto mine own house, with full purpose, as much as in me lay, not to trouble myself with any business, but solitarily and quietly to wear out the remainder of my wellnigh spent life: where, methought, I could do my spirit no greater favor than to give him the full scope of discourse, and entertain him as he best pleased, and withal to settle himself to be best liked; which I hoped he might now, being by time become more settled and ripe, accomplish very easily."

Who that has lived to forty years does not recognize the signal given in this passage? It means, if one will, that the blossoming time is over; that we have seen the bloom and accepted the fading, have won our little victories and faced our defeats; that we realize in ourselves the universal flux and rhythm of nature, and that the time is at hand to renew relations with the great, sweet mother, to cuddle down secure on the low, warm, level of the soil from which we sprang, not to delight in sport upon Earth's breast, giving back to her the blossoming we have in our person outlived. Mock us, say may, at times here as to unmeasured efforts, break faith with us when and as she will, and yet through all the toil we expend upon her, slowly and surely she induces us into the true nature of things, teaching us to strive without renouncing, to hear with smiling patience, to fling out dreams ever beyond the moment and the present life, knowing, however secure we are of our knowledge, that the tale has but been told us in fragments here, and that wherever there are fragments, broken bits of ideals, shards of hopes, somewhere in infinity is the whole.

Personal and Pertinent

Mrs. JULIA WARD HOWE, now almost a septuagenarian, is still moved by living enthusiasm for the cause she has long supported. To a young Northern writer who was introduced to her in Boston last year Mrs. HOWE, after due exchange of conversation, said: "And now, my dear, go home and start a little club for women; any kind of a little club, but make them meet and read and talk. That is what I did. I can't tell you how many little clubs I've started in my day." One can easily realize what a godsend to dull and shut-in lives Mrs. Howe's clubs may have been a half century ago when the *costs to women's lives were fewer than they are now*. (Chas. novelists, however, are accused of drawing women away from more serious and worthy pursuits than they can furnish them.)

Professor ALBERT BURNELL HART, of Harvard, has of recent years spent several long vacations in the South, learning what he could at first hand of contemporary conditions there. Of his studies he has made preliminary use in a series of Lowell Lectures in Boston. In his fourth lecture (March 2) he touched upon amalgamation, or miscegenation, whereof he found altogether too much both in the past and now. He quoted estimates made by Southern whites that of about fifteen hundred thousand miscegenators in the South not more than a million are the children of miscegenation. He could not make sure whether miscegenation was decreasing, but thought it was somewhat. "There is no strong denial," he says, "that a mixture of the races now or in the future would be calamitous. This belief rests upon the conviction that the negro race, on the average, is below the white race; that it can never be expected to contribute anything like its proportion of the strength of the community. Therefore, to fuse the races means slight or no elevation for the negro and a great decline for the whites. With that belief I coincide: it is a hard conviction, but it must be expressed. And if amalgamation is dangerous, then such steps must be taken, in all justice, in all humanity, with all effort, to raise both races, as are necessary to prevent amalgamation."

ANATOLE FRANCE in French literature of to-day holds a position in many respects analogous to that held by ANDREW LANG in English. Both are critics, both novelists and historians. Both, too, are stylists, though the ironic humor of the Gaul is different and more subtle than the more genial humor of the Scot. Each of these men has a particular fondness for certain periods of the history of his respective country. Mr. LANG has delved much in Jacobite history, though it is in the period of MARY, Queen of Scots, that has received his best attention. ANATOLE FRANCE, in turn, is deeply versed in medieval history, in the pathology and the fascinating legends of monks and monasteries, to which he evinced a devotion, even as a boy, before he entered the Ecole des Chartes. The Scot's best work is perhaps his *Life of Queen Mary*. The Frenchman has just published a *Life of Joan of Arc*, which critics find to be his greatest achievement, and the final and standard work on the subject. But to Mr. LANG the work of the *Ancientist* is a disappointment. He finds in it many misstatements and inaccuracies. In one place M. FRANCE says that the said "feigned ecstasy," and in another that he "does not dispute her honesty," and that "she cannot be suspected of falsehood." Mr. LANG further points out, according to M. FRANCE, the reports in the Italian chronicle of MOROSINI "contain not a single fact which is presented in its true character"; yet M. FRANCE twice tries to prove, "on the sole evidence of MOROSINI's reports, that JEANNE made a false prophecy." It is to be hoped that M. FRANCE will take notice of those strictures, for nothing could be more interesting than a heated battle between the Anatole France of Britain and the Andrew Lang of Gaul.

Correspondence

CHRISTIAN SCIENCE AND HYPNOTISM

Boston Mass., March 26, 1898

To the Editor of Harper's Weekly:

SIR,—In a recent issue of HARPER'S WEEKLY two columns were given up to a review of Dr. John D. Quackenbush's theories on "Hypnotic Therapeutics." His statements about Christian Science are all the more surprising because he roundly abuses it for doing what he himself is urging should and can be done. He accuses Christian Science of being auto-suggestion, and groups it, with other methods, under the general title of a "coterie of impostures." Apparently auto-suggestion in the hands of Dr. Quackenbush is a beautiful and invaluable method of healing, but to the lay mind it is not quite clear how he can denounce it in one case and laud it in another, how he can consider it an imposture in one case and a revelation of absolute truth in another. As far as Christian Science is concerned, it makes no difference what attitude Dr. Quackenbush chooses to assume toward suggestive therapeutics, inasmuch as Christian Science has no kinship with it.

It would be useless to categorically refute the unjust charges that

fairly bribe in Dr. Quackenbush's remarks on Christian Science. It is sufficient to say he has given clear evidence that he does not know enough about Christian Science to intelligently criticize it. He says: "The hopelessly dead are treated by screaming in their ears, 'You can hear.' He says Christian Science teaches that 'a person prostrated with diphtheria is not sick, but only thinks he is.' He refers to formulae as integral parts of Christian Science treatment, all indicating that he has not a true or proper sense of the teachings of Christian Science nor of its practice. He explains the phenomena of Christian Science healing on the basis of hypnotic suggestion. As a matter of fact, the study of the development and activity of the human mind finds no place in Christian Science, which claims to be and is proving itself to be a restatement of the pure idealism of Jesus' theology. Jesus was not a hypnotist. He did not cure his patients by substituting one belief for another, but he declared that His Father did the work. I suppose no modern Christian would be independent enough to say that God is the master hypnotist of the universe, and so we must admit that Jesus' cures were not the results of hypnotic suggestion. Now the Christian Scientist endowments with some success to be possessed of the same mind that was in Christ Jesus, be dispossessed of the human mind, and to allow the Father to do the work, as Jesus promised He would.

Dr. Quackenbush admits that hypnotic suggestion may be abused, and he frankly acknowledges how little the scientific world knows about this subject. Others agree with him as to the danger of suggestion. Dr. Samuel McComb, of Essexville Church, Boston, lectured in Buffalo recently. After his remarks he was questioned by the doctors present. Some one asked him, "How many persons can be hypnotized?" "I should say about ninety per cent," Dr. McComb is reported to have replied. Then Dr. James W. Putnam, of Buffalo, said: "Well, if ninety per cent. of the people can be hypnotized, I should say that ninety per cent. of that ninety per cent. should never be hypnotized. I have used hypnosis once in ten years, and I hope I shall not use it more than once in the next ten years. It's dangerous!"

There are in the ranks of Christian Science both the learned and the unlearned. There are those who are very simple, plain people, and others with scholarly intellects who have had an academic education fitting them to scrutinize and analyze the theological and philosophical claims of Christian Science. The grotesque charge that Christian Scientists are amassing wealth is amusing to the average Christian Science practitioner, who finds that in many cases he is obliged to supplement his philanthropic work for mankind by some commercial pursuit in order to sustain himself.

Dr. Quackenbush's statement, "No case of organic trouble has ever been cured by Christian Science or ever will be," shows that he has not investigated the subject very carefully me that provide which is supposed to accompany scientific investigation. I am glad to assure him that there are many cases of organic trouble which have been cured by Christian Science, and the evidence is not difficult to obtain.

Dr. Quackenbush also makes the flat assertion that "scores of perfectly curable cases have been sent by its fanatics to the undertaker." It would be interesting to have the names, dates, and places of these scores of cases along with the circumstances. Dr. Quackenbush also says, "In some States it is regarded as a misdemeanor to give Christian Science treatment." I am very glad to be able to tell him that this statement is quite as incorrect as the others. In no State in the Union is it a statutory offence to give Christian Science treatment.

I am, sir,

WILLARD S. MATTHEW.

SAVE THE SCENERY

BIRMINGHAM COURIER, March 21, 1906

To the Editor of Harper's Weekly:

Sir,—I wish to express my grateful thanks for the article in your edition of March 7, entitled "The Race of Travel." Would that something could be done to stop the interminable stretches of unsightly sign-boards that blot our landscape.

Last summer I held for the first time the historic locality of Harper's Ferry, and that lovely cliff overlooking the Potomac, had upon its face a "proclamation highway" surrounding a certain toilet preparation. The fact of that brazen sign being placed in such a position ought to keep any man or woman from ever using one soopen of that preparation.

I am, sir,

L. E. B.

JOVING STUBS ON A MARGIN

New York, March 21, 1906

To the Editor of Harper's Weekly:

Sir,—Would you kindly favor a number of your readers—for I am convinced many would like to know—(1) if, in your opinion, the buying of stocks on margin is a method of doing business in which young men or any one of limited means should be encouraged, and if not, why not? (2) Is it not a fact that only a small percentage of the men who buy on margin are successful, with the expectation that the buyer shall pay the full purchase price for them? (3) Is it not a fact that thousands upon thousands of men are ruined every year by this system of "buying" stocks? (4) Isn't this method of "investing" in stocks as much of a gamble as "investing" in a horse race, or investing in a game of poker, and if not, why not? (5) Does HARPER'S WEEKLY—the "Journal of Civilization"—advocate "investments" of this character?

I notice that Wall Street will receive some attention in your

next issue. Would it be possible for you to answer these questions at that time, and oblige one who would like to remain

A CONSTANT READER.

(1) We would not call it a method of doing business, but merely a method of buying stocks. We would not encourage it. It is too risky. When you win, it is too much like getting something for nothing. When you lose, it is too much like getting nothing for something. If you do much of it, it distracts the mind too much from steady work. Nevertheless, some experience of it is sometimes usefully instructive to persons who can afford to learn in that way. But it does not need our encouragement. It's too much done as it is.

(2) We believe it is.

(3) Thousands lose some money. Not so very many are ruined. A great many speculators are scared off by moderate losses, and some win.

(4) People don't invest in horse-races or poker. They merely bet. They really do invest in stocks, and very often they pay to tell for what they have bought, and take their stocks away.

(5) No.—EDITOR.

UNDOUBTEDLY COMPETENT

March 21, 1906

To the Editor of Harper's Weekly:

Sir,—Among the names suggested as available for nomination for the office of President of the United States, has it ever occurred to any one that Mr. John Pierpont Morgan, a master of affairs, might merit consideration?

Regardless of sectional party affiliations, where may one find more sterling integrity, forceful, innate resources? Deeper patriotism. With the cabinet of his wise selection, the material interests of the Republic would be guarded beyond a doubt, and what a rapid elimination of the unfit!

Genuine America once again in evidence.

I am, sir,

INCOSITE

FREMONT AND NEW JERSEY IN 1856

EVEN. KAN., March 21, 1906

To the Editor of Harper's Weekly:

Sir,—In the WEEKLY of the 7th inst., in the editorial entitled "Sixteen Better Candidates than Bryan," is found this statement: "In 1856 John C. Fremont obtained New Jersey's electoral vote for no other reason than because his running mate was another Jeremiah, William L. Dayton."

That is a mistake. The vote of New Jersey in the Presidential election of 1856 was as follows:

Bushanan	40,943
Fremont	28,338
Fillmore	24,115

Fremont and Dayton carried but one county in the State—Owen, and which polled only a small vote (less than two thousand). Even this county failed to give them a majority over both the opposing candidates, but only a small plurality over Bushanan.

(See Tribune Almanac for 1857, p. 56.)

I am, sir,

L. STELLWELL.

ELIMINATIONS CALLED FOR

ALBANY, N.Y., March 21, 1906

To the Editor of Harper's Weekly:

Sir,—I would ask an indulgence of your time to voice the thanks of one young Democrat for the very splendid fight you are making toward the return of our country to conservatism and Americanism in politics and business—particularly your efforts to warn Democrats and Republicans from their allegiance to false friends. The enthusiasm in national politics of the average Southern Democrat of my generation has been wounded, and when we vote it is only a compliment to the teachings of our fathers, though a very poor one to our intelligence. We all feel the futility of voting for Mr. Bryan and other repulsive leaders who his ideas. The politician's ever-present bugaboo of the Black Devil whips us into line to vote for the men who are seeking their own political advancement rather than the limiting of new capital among us, the bombing of new people, and the starting of manufacturing and other enterprises by our labor. The very recent moderate legislation by some of our Southern States has intimidated capital, not so much with what has been done, as what will be the future of new dollars and brains if bound to help the old ones. Our helplessness men are discouraged, labor is becoming idle, and our machinery will rust, but the politician points out to the farmer with pride his record of helping cripple the men who furnished the money to the farmer and laborer to make his past prosperity. An assurance that Mr. Bryan and Mr. Roosevelt would be eliminated, or their avowed policies, from the coming campaign would revive business quicker than any one else's agency. With a united Democratic, a new national leader like Judge Gray, Governor Johnson, or Governor Felt, would bring to its support the brains, time, and money of the independent thinker of all parties—and they always hold the balance of power.

I hope the attacks and misrepresentations of self-seeking politicians and a hostile popular press will not discourage the strong effort you and other conservative opinion formers in the daily, weekly, and monthly press are making to bring the country back to an era of plenty and prosperity.

I am, sir,

M. N. McVILLAGE.

Finance

The Effect of Some Recent Court Decisions

By HORACE SCHENCK MOTT

FOR a long time the *demagogue* has been having things his own way. Inflations in railroad rates, in street-car fares, and in the price of gas have afforded him pasture in his legislative hours and glory among those of his constituents who are perpetually dissatisfied. Meanwhile the owners of property have trembled at every fresh onslaught, and have wondered whether the Constitution of the United States is only an antique curiosity suitable for a frame and a library wall.

But that venerable instrument apparently must still be regarded as a vital part and the fundamental basis of our national life. The question, "What is the Constitution between friends?" is eloquently answered by the United States Supreme Court in a decision handed down at March 23, in what is known as the *Minnesota Rate Case*, as follows: "The question of the sufficiency of rates to enable the company to obtain some return to its stockholders for their investments has for many years been held to be one for the courts to decide, as it would be a violation of the Constitution of the United States to fix rates so low as to be confiscatory if enforced."

This statement of our organic law is blunt and emphatic. Greatly disturbed as the owners of securities have been by legislative encroachment upon corporate profits, good lawyers expected no different pronouncement from the courts. While it may be considered that power resides in the legislatures of the several States or in Congress, as the case may be, to prescribe rates or prices that may be charged by corporations of a semi-public character, compulsory laws must not be confiscatory and must allow a reasonable return on invested capital. The question, What constitutes a reasonable return, is one that must still be adjudicated. According to the Pennsylvania courts it may be six per cent. Yet, a few weeks ago, in rulings in the course of the settlement of the eighty-four case now preparatory to appeal, Judge Lough said: "It has not been asserted and is not believed that six per cent. is a profitable, satisfactory, or attractive rate for the investment of capital in the city of New York, or that it would be considered fair to those who are engaged therein and cannot readily escape."

As a matter of fact, the question of a reasonable return on invested capital may never, except in isolated cases, be possible of adjudication. So many different conditions enter into a consideration of reasonableness that both legislatures and courts may be kept busy indefinitely without reaching a satisfactory conclusion. For example, here is one general difficulty that seems to defy a permanent conclusion: In the latter part of 1900 and during 1907, when average rates for the use of money in ordinary commercial transactions were seven per cent. to ten per cent., surely a six per cent. return on an investment was relatively less than it would be now, when average money rates are from three per cent. to five per cent. Furthermore, the income from a six per cent. investment a year ago, when commodity prices were high, had smaller purchasing power than it now has, when commodity prices are lower. The folly of attempts to interfere with the natural laws of trade has been amply demonstrated in the nonobservance of vital statutes against money. A similar result will follow the application of rigorous compulsory laws, or capital will refuse to embark in enterprises so restricted.

To return, for a moment, to the Supreme Court decision (there were two cases decided, including provisions of the jurisdiction of the United States courts, one in relation to the Minnesota railroad rate law and the other to the North Carolina railroad rate law), Justice Peckham reasons that the penalties provided in the rate laws, consisting of fines for the railroad companies, and imprisonment for their agents and employees, are as enormous as to deter the companies from testing the validity of the legislation in the courts, thus depriving them of the equal protection of the law to which they are entitled under the Constitution. This statement contains another idea on which our reckless lawmakers may reflect. The coal lands of the floating Railroad Company are part of the security under the mortgages covering its bonds. It is said that the company has been deterred from questioning the validity of the *Beidorn* railroad rate bill because it dared not meantime incur the penalties of the act. Yet at this writing, apparently, no practicable method of complying with the provision of the act calling for a separation of the coal lands from the railroad property has been found. Possibly the company will see its way clear, but the test of the statute.

The Supreme Court sustains both Judge Pillsbury and Judge Lawrence, of United States Circuit Courts, in taking jurisdiction in these cases from the State courts. That the United States courts have jurisdiction in cases involving rights guaranteed under the Federal Constitution should be beyond all question. Any litigation might drag wearily on through all of the State courts, which would be incompetent to pass upon the questions involved, and finally reach the United States Supreme Court after

irreparable damage had been done to a corporation or an individual. It is pitiful enough that the delays of justice are long and costly, but it is good to know that they may not be unnecessarily lengthened.

In speaking of the penalty clause of the Minnesota railroad act, Judge Lawrence characterized the legislation as vicious, a disgrace to the civilization of the age and a reproach upon the intelligence and the sense of justice of the legislature. This is rather vigorous language, but no more vigorous than the censure demanded. Our State legislatures as a class are so moved by ephemeral popular clamor that they lose both sense of proportion and sense of justice. When they retain either or both, they have not the courage to withstand the party boss, which is wicked in a man sensible to do more for the "people" than has yet been done by the opposition. Policies, unfortunately, play far too large a part in our industrial and financial life. But the politician who yesterday was willing to assist in the passage of unconstitutional rate laws, to-day or to-morrow, finding a change in popular feeling, will be just as willing to repeal them.

Meanwhile the holder of securities has ample reassurance that his property rights will be protected by the courts. As an address delivered before the Economic Club of New York, on April 4, Professor Gillingham of Columbia stated that the American mind runs into the mob mind a little more readily than does the French or the German mind. This is a sweeping generalization which, if wholly true, constitutes a serious reproach upon our national character. But it is not wholly true, for the reason that such exhibitions of the "mob mind" as we experience speedily give way to recollections of feeling and sober second thought. Sober second thought sometime since began to influence the minds of the courts of this country, so that to-day the decisions referred to above fall upon minds receptive of sane counsel.

Perhaps no recent event contains for the investor in securities a larger degree of comfort than these decisions of the Supreme Court. Their ultimate effect will be far-reaching, for they will do much to promote the return of confidence and to encourage the interests of capital in the country's productive enterprises.

Early in the year 1907, after the Stock Exchange, in declining character, had indicated the coming of a financial and business disturbance, for a long time it was impossible to see any material let-up in the activity of business. This situation may properly be ascribed to the fact that the troubles of the past year had their origin in a very extensive inflation of credits and a serious shortage of loanable capital, or "money,"—a shortage too great to permit the conduct of business at the price of activity then prevailing. Naturally an inflation of credits and a shortage of loanable capital found their first reflection in the financial markets, in the prices of securities.

The first commodity to show a recession in demand last year was copper metal. After reaching a price of about 25¢ cents per pound in March, 1907, the indications of coming business depression given by the Stock Exchange, and the inability of the public service corporations, which are large users of copper, to finance their needs, suddenly checked consumption. In fact, consumption ceased almost altogether and the price of copper broke violently. The decline in the price of the metal caught producers with large stocks on hand, with practically no having power from domestic consumers; and it was not until late in the year that this trade situation was relieved by very heavy sales of copper for export. Experts of copper during the country's production, November, and December, 1907, reached record proportions, and the movement of the metal across the water continued in heavy volume for the first two months of the present year. This movement was of value to this country, not only in relieving a serious overproduction in the copper industry, but because it added to a favorable international trade balance for this country at a time when a big balance was badly needed.

Only once since 1898 has the price of copper declined below 12 cents per pound. It went to 12½ cents in February, 1908, which, so far, is the bottom this year. About the first of March, 1908, for the first time in nearly a year, a little demand appeared from domestic consumers and the price of the metal advanced about one cent per pound. The reopening of the Anaconda and Copper Company's mines, a few weeks ago, expressed the judgment of the directors that improving business conditions would result in an increased demand for the metal.

Perhaps the third feature of the recent strength in the price of the metal lies in its significance for the business situation as a whole. There was a great deal of speculation in the metal when it was twenty-five cents per pound. The violent decline represented the pricking of a bubble. One of the weakest parts of the industrial fabric at that time, it was the first to collapse. It has, therefore, had a longer time in which to recover than other industries which met their setbacks later. This recovery has been so in, however, may reasonably be taken as a prophecy of recovery elsewhere.

The Second Squadron of Admiral Evans's Fleet cruising in Line of Squadrons off the Straits of Magellan

Through the Straits

By ROBERT DUNN

SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY" WITH ADMIRAL EVANS'S FLEET

AROUND U.S. "BROOK ISLAND," STRAITS OF MAGELLAN, OFF CAPE PILLAR, FEB. 2

AVE you ever trumped in lilly New England? And seeing a mountain to climb, inquired at a farmhouse concerning trails and time needed to gain the top and return? And been told that you purposed an ashured-of-foot—one no husky hayseed had ever tried? No, in confident disgust, you scaled your hill, and more quickly, more easily, than you anticipated; and then shrunk from announcing your temerity on those who cried "wolf" at the farm.

I imagine that this is somewhat the way the fleet feels in the matter of passing these Straits of Magellan when it recalls the misgivings of those at home who rather shied at the prospect of risking nearly all our battleships (three and a half miles and some 10,000 worth of the doped-draught steamers that over passed there) in the channels and weather that have the worst repute of any in the world.

It is now 8.30 P.M. Fifteen minutes ago, across six miles of drizzle and spindrift, we touched the ghostly band of a search-light upon a humplike knoll, ahead and to port. Back here, seventh in column, we were not the first to sight Cape Pillar; but memorable, somehow, should be the straits in which sixteen gleaming arms of light revolved out to grip upon that pole of land. Their light dredged from it no detail; they quivered backward again—withdrawn tentacles. Here the steady air-lean from each forward-bridge still played upon the white foam collar of its ship's towing-spear. But the American Armada was in the Pacific. The crux of the voyage was past.

The band had been playing nothing appropriate, because it was not impressed enough to pick out a fit tune (if it has one); and the ward-room was at its nightly bridge game. But just then some one dozing on the mainmast woke up at the laugh over the rescue of a risky make, or at the gentle swell, now first perceptible.

"Say, tell me," came his bored voice, "what ocean's this that we're in now?"

No battleship had the pettled mis-hap; not even a steering-gadget jammed. The broken reversing gear on the torpedo-boat *Leopoldo*, fixed in an hour, concentrated the fleet's distrust. It has none but the good word for where, as the book says, "prevails the worst weather in the world, and winter and summer alike, with rain, snow, hail, wind—there is absolutely no fine season." agreed that the vessels would run Magellan one at a time—that is, separated from each other by the tide interval (six hours), on account of the "violent snow squalls which make it difficult to keep one's bearing and position, and land currents, where two ships caught near together, and in a snow squall of any duration, might be dangerous to one another."

Of course the fleet did not pass through singly, but in exact column, at regular intervals (four hundred yards from bow to bow of each ship), in a four-ship squadron of ours had done be-

fore—in 1892. The set speed of about 10.25 knots an hour was not once relaxed even in the gale and dense drizzle of the afternoon run from Atreco Rock to Pillar, the stormiest end of the pass, where land only a few miles ahead was not once sighted. No current, cross or tidal, even through the dire Crooked Reach between Carlos III. Island and Playa Parla Harbor, in which the channel narrows to a mile, mislabeled so liberally as much as three hundred yards. The lead wind never exceeded "seven" (which is naval for what merchantmen would call "less than half a gale"); and there were no squalls—"woolies"—at all.

One has no idea of throwing cold water on an achievement. Scarcely did we enter the channels at the first season, and maybe with the good luck—Evans lack, Roosevelt lack—that has followed the cruise so relentlessly, perhaps so dishearteningly in some narrows. Nothing fell out in the frantic way, according to book, for these parts: Cape Crossed should have been lined with wrecks, but wasn't; the scenery should have been "grand and wild," but it was trivial beside Norway, insignificant beside

Alaska; we saw not even one skinned animal Fagien woman diving for sea-urchins with great dexterity." So we aped a Coleridge mood by quoting "The Ancient Mariner," and supposed the following petrel to be albatross.

At Punta Arenas, Magellan is unequally divided both by man and by nature, as you know. Hence one hundred and ten miles to its eastern entrance at Cape Virgin the land is low and treeless, the channels wide—ten to twenty-five miles—but with shoals, big tides, moderate currents, anchorages. The two hundred miles from Sandy Point to Pillar, mountainous and wooded; channels from one to ten miles, averaging six, great depths, no anchorages, weaker currents, but thicker weather. One might think that such items would offset themselves, but any skipper will tell you that the most ticklish navigation is in the second narrow of the eastern stretch. Although the fjords west of Cape Froward have the worst name, popularly, most ships' bridges consider the worst over when they emerge from those narrows around Santa Magdalena Light before Sandy Point, the most southern—and amazing—settlement in the world.

At sea in the Atlantic, on the afternoon of January 20, the fleet got a wireless that our repair ship *Peacock* was anchored in Possession Bay, just inside Cape Virgin. The ill-drawn squally, with a sou'west wind. About ten o'clock, as we the gray sea, starboard appeared suddenly rigid—a disconcerted, flat, unimpaired coast, marked sparsely with truncated hills, spicily brown and low. Seven bells, and the white Virgin Light was ahead, overlooking San Martín Island from a low bluff like a curved river bank; beyond, ending a spit that ran south for four miles, a Lighthouse Station and Dungeness Light—the black and white banded lighthouse pole ast. We crossed to S. 82° W., passed it at two miles, shifted to exact return, and were in the straits just at noon.

Cape Catherine, their southern portal on Tierra del Fuego, hard-

Looking Back on the Fleet in "Crooked Reach" THIS PHOTOGRAPH, WHICH SHOWS THIRTEEN SHIPS IN LINE, WAS TAKEN BY LIEUTENANT-DEMANDER PHILIP ANDREWS, EXECUTIVE OFFICER OF THE BATTLESHIP "KANSAS"

by defined herself, for yonder the immense land locked one dimension—thickness. We hugged the Patagonian shore, kites of a forgotten wreck desolated the black beach. Rag squalls advanced, and of an indigo intensity than I have ever seen; the gale rose once to "ten" ("twelve" is the naval limit), and the swellings green channel veined itself with whiteness. But still the fleet's "ping-pong" tactics snappled, and we slipped out a submerged torpedo sled to see if it would buckle under way. The *Lieutenant* slipped a cog in her steering-gear, and dropped out of line for a while. A British merchantman spun past to starboard; then two tramps in port, one a German—the morning eddies east from Sandy Point on the old tide. It hooked us at a two-knot gait, so the thirty miles to Possession Bay were not covered till four o'clock. There, to make sure of passing the narrows by daylight, the fleet's anchor chain roared out for the night in a burst of brilliant sunshine. The *Peacock* was gone. Depth, twenty fathoms. Temperature, 50°.

It's hard to keep from reading dry as a log. Under way February 1, 4 A.M. Clear and cold. Column right column left, southwest to Delgado Light, guarding the first narrows. The favorable flood was beginning, but as no current of the straits, except in narrows, is effective until three hours after slack water we got no shore-aloof until Delgado was ahead, and then not more than four knot help. White sheep learn ashore there struggled against the light, and west, toward Punta Arenas, telegraph poles marched over the dismal land, exactly as you see them from the windows of a transcontinental train. And just as you see cattle-men thus in a Western town, the sheep lands here patterned before one king shed, with a red roof, boards sunk, hands pocketed, leaning slightly against the white washed boards in the pale twilight-midnight. They seemed even to have the cowboy's bored, superior stare; yet most likely were gazing their eyes out at our passing, three and a third white miles of snaky gale.

Then Philip Bay, eating away into Finland, so its surface touched the sky, and the second narrows. Certainly the channel was well landscaped; a triangulation standard capped every swell of the land. Four to seven knots of current, plus our speed of ten, heaved on the swinging whip line of white steel, but no rip or eddy swung any ship aside more than fifty yards. On the bridges the navigators told their midshipmen assistants to mark here the riskiest navigation of the voyage. But from the quarter-deck one never would have guessed it. Only a mile away, on the steep shore, you saw a flutter of black birds from rank on rank of such rust holes as bank-swallows build at home, and searching the ashing land for asparagus you might sight a dwarfed antarctic leech.

Our wireless began to work. A Chilean cruiser, the *Ocho-loro*, lay at Sandy Point (now twenty-five miles off), with Admiral Simpson, of the Chilean navy, and Mr. Hicks, our minister to Chili, aboard. They asked us to anchor off the town in line of squadron; they would send out a tug to meet us with the chart maps of the straits, and steering south far across square-beaked Magdalena Island, and fared a far shore making straight away south. As if by miracle, rolling hills darkened timbered, touched with snow, arose there, guarding a gray smear by the sea—Sandy Point. A yellow tug puffed out; a boat from the *Consuelito* was lowered, and at eight bells we dropped anchor by the frigate's broad stern, and the Chilean port captain British cruiser of all ports off the beaten track.

Sandy Point has shared the straits' deserts, as the jumping-off place of deserters, beachcombers, fugitives from justice. But the down gold-diggers across in Fuego, the surrounding sheep ranches, have changed all that. Today it is—Leeds, S. D.; and were it in Alaska, Seattle would be keeping it with head-lands, and boosting a "rush." It is not even the world's southernmost town any more; Porvenir across the straits is that, and if our flag waved over Fuego the island would be dotted with camps, for the climate is rain and tropical beside Cape Yema. Sandy Point has the frontier's broad streets, low shacks, multitudinous hotels; only corrugated tin replaces scuttles, and the bars are without foot-rails. The Spanish touch shows in a plaza with a fountain and a municipal open house, where the show would be playing but for an overabundance in choosing the ladies of the chorus. Naturally the rumor about blowing the fleet up had never got its staffer's head there, and the Chilean port captain did tell of four mysterious Orientals who had entered the town and vanished like shadows fifteen days before. A collier with 6000 tons of coal was a day late, and we of the *Rhode Island*

rearily too two midshipmen in a rapined sailing launch. Yet the torpedoes' course is on time, dark ashore acted the gentleman he is, and as for his officers—the warmth of Chilean hospitality which began with leave for each to cable salutations home gratis, cooled the week but quite at the boiling-point.

Sunk-out from there the forest rumples upward into bluish mountains; snow streaks flash against a raw sky. But the coastward into the black horizon of twelve day in Fuego, then swing south along the rising hills there, till you come to the narrows, least promising gap of water between the highest peaks. That marks Magellan's route, into Famine Beach, past San Isidro Light to Cape Froward, the southern tip of the western continent. The fleet "upped its books" near midnight, February 7, at wind NW, to W.N.W. (it always is), and blowing "four" to "seven"; thermometer in the fifties. We coiled snout, quite five miles now of solemn black smoke and magenta glitter, for the *Chacabuco* led us cooing, the torpedo flotilla joined in, the *Peacock*, *Falcon*—all but the *Fastnet*, which had pulled out a day ahead. With the sun rising at 4.40 A.M. and setting at 7.20 P.M. we would have, counting twilights, about sixteen hours of daytime

for the run of one hundred and sixty miles from Froward—at less than 1000 hours' performance has tallied exactly with these mathematics, for an hour ago, but for the drizzle, we should have saved our eyes (streaked with light).

Before five o'clock we were close in off the hemisphere's tip, and changing course to north of west, Fuego, now almost alpine, smothered the sun, so it slanted pillars of a violent orange upon Dawson Island to port. A glow stroked the even shores of Mount Sarmiento, 4700 feet—and the highest peak we have seen. Our "strategy board"—some of the staff—paced the quarter-deck under shelter, linearly and compass, and the lookout for glaciers.

And Froward promised well enough; a gashed ear gleamed in the tiny beak of the antarctic beech, a brown bridge of saw-teeth behind properly patched with snow. And the current obliged, but only by a knot or so. Whatever the right wind was, it blew straight against us between the heightening walls of the Froward Beach, now narrowed to eight miles. It blurred us in a mist of raw cloudiness and eider, so that, being in exact column and on an unchanging course, we saw no more than the stern of the *New Jersey* ahead, the steady ruff about the Virginia's bow behind, unless a lurch of current or a belittlement's slip waved either from line. Half of them to port, half to starboard, the black flotilla tumbled on, until their dead stop for the luckless *Laurence* at six o'clock.

Eight o'clock, and we swung into the English Beach, veering so that the whole vast line was visible, tempering the paucity of the cliffs. The *Chacabuco* led the *Snagby* by quite two miles, and our Fourth Division, independent as ever in its conviction that it is the star cruising division, because it is the oldest, kept wide water between the *Indomita* and the *Maine*. The German mail-boat, which left port at dawn, plunged on and past at starboard. Ahead of us the *Albatross* lay on the morning's nose of the Charles Islands, and beyond them on San Fia, our strategists made out in three places the true rumpy green of glacier ice.

Far the first time the column seemed to be disrupted by the currents: the *Georgica* moved broadside slightly to port, the *Kosmos* to starboard. Ahead the straits seemed to divide against the triple-deck needles of the Thornton Peaks (which in the States would have been named "The Three Sisters"), and Jerome Channel opened north.

We turned due west around Cape Croiside, the northwest point of Carlos III. Island, and at half past nine stood in the eye of the straits, at the heart of the great waterway. Between the cape and the black buoy over Amos Reef, exactly on the starboard beam—the only one west of Froward, because the perfect depths need no more—was scarce more than a mile. Between here and Playa Parda Harbor, twenty-eight miles west, the Atlantic and the Pacific divide, not, or rather overlap, by a meal of more according to separate tables. You read that the stretch off Croiside, therefore, is marked by "a soothing mass of water and foam," and that "the strong eddies have a marked effect upon the steering of a ship." Maybe—at times—and to tramps. But battleships drawing twenty-seven feet can give credit to the steadiness of cathedral. We saw port the whole way, a mad stream; the column wavered not one oar; it was like twisting through a mill-pool into the long three-mile-wide channel of the famous Crooked Beach.

RECORDING CAPE VIRGIN, THE ENTRANCE TO THE STORMY STRAITS
THE VESSELS FROM LEFT TO RIGHT ARE: THE BATTLESHIPS "VERMONT," "NEW JERSEY," "MINNESOTA," "OHIO," "MISSOURI," "MAINE," "ALABAMA," "ILLINOIS," "KEARNAH," "KENTUCKY," AND THE SUPPLY SHIP "CULOGA"

Wrecks should line the shores here, according to look, but we saw none. A flock of ducks dipped over our bows, and the crew up there pelted them with holystones. [This has been "field day," which means a general spring cleaning, only it comes every Saturday.] A black tramp snaked outward to port, and again all colors dipped. At eleven o'clock the tide ceased to favor us. We were about a mile from the south, and there our stratagems discovered the scaled surface and high ledges of a sure-enough glacier all but touching the coast—a slim icicle beside the average of our North Pacific, but clean and healthy, bearing little moraine for all that.

Henceforward, though half the distance from Puntarenas to Pillar still remained, it spelled for the eye—Monotony. Drizzle and mist shut in and lifted in the magic manner of all sub-arctic coasts. It thickened at noon, cleared from half past one to two, another east-going breeze with a red fl on its funnel passed, and the head gale blew up to "seven." We entered the Long Reach; looked in vain for Mount Wyndham, 4060 feet, northwest over Playa Parla. Never more than our nearer bounding walls narrowed through the thickens; and they, pale and chaotic, low and rubbly—see you see rock about the shoreline of a retreating glacier—averred the age of the great ice avenue that once cut this channel from ocean to ocean straight as an arrow. Yet the desolation that in many wastes of the world depresses and vilifies strong men against their will does not breed there. Now and then a tree struggled from a cliff, and timber growing upon the sort of void that depraves is a paradox.

The fatilla caught us up at three o'clock in a moment of almost darkness. They plunged on like porpoises, and at more than twelve knots, to reach the entrance of Smith Channel before dusk, when they follow up the coast behind its islands as we

The "Connecticut" following the Chilean Cruiser through the Straits

PUNTA ARENAS AND ESCORTED THE SHIPS TO THE PACIFIC

gloom. At seven came the promontory darkness; seven-fifths and a muddy bottom at half past, all towing-spars over ten minutes after. "You'd think," complained some one, "if it's going to be rough off this Cape Pillar we'd feel something now."

"Whoever named those islands sure ran through here with a fairer growth," says someone else. "Desolation, blood-stained Harbor, Breaker Coast, Port Famine—how he must have hated himself to give a good enough country such a black eye."

The light on the rock of the Four Evangelists is visible. It must be about the leastest point in the world, that. The rain is driving strangely through our searchlights. Their stiff bars—like the ghosts of twelve-inch guns—disappear each drop, so it seems as if a blizzard were raging on deck. The towing-spar plunges on, a following sea monster between under that unearthly light, in sprays of green verging into violet, white into green; time, behind each ship down the long line. The thirteen thousand of us, moving along together, can see it. It has been inexpressibly moving, after all.

As the Executive Officer Saw It

By LIEUTENANT-COMMANDER PHILIP ANDREWS

EXECUTIVE OFFICER U. S. S. KANAWA
SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY"

U. S. S. "Kanawa," at Sea, February 20, 1901.

THE ships of the fleet left Sandy Point about midnight of February 7, having cruised day and night in order to gain time. At Punta Arenas the people assured us that we had brought the good weather with us, and, when it still kept fine and bright, that it never had been clear for so long a time.

Whether this was true or not, we carried our good weather right through the straits to the western end, and even there had the best of which that tempestuous corner of the sea is capable. The first night's run, only a few hours of which was in darkness, was in a wide part of the straits, and we did not reach a narrow part until eight in the morning, when everybody was about to see that the terrible Straits of Magellan might be fiercer, and in gaze at the really beautiful scenery. Of fierce cross currents, heavy luffing winds, and other menaces, we encountered none. Bright clear weather with occasional sun, light, perhaps occasionally moderate wind, and a smooth sea, we had all the time. The sudden fierce gusts of wind that are met in the straits and in Alaska and freezing Sea are called "Williwaws," but none of these did we see, nor even any of their remote cousins. The narrow places were not specially narrow, and we frequently passed steamers. One German steamer passed us, gaining slowly, and was in sight for some hours. Our faithful friend the *Chacabuco* came with us, leaving Sandy Point at the same time we did.

While I am sure that no one in the fleet had felt that our passage through the straits would present any great difficulty, the reality seemed little short of ridiculous when we considered the grave forebodings and the dismal doubts entertained and expressed as to the safe passage of the ships. Of course the winter season in that latitude, either south or north, is stormy and bitter, and snowstorms and heavy rain or hail then make the navigation difficult, because it is difficult to see. But in the summer it does not seem much of a navigation problem for a modern ship, and in the winter it is certainly no worse than many other places—Bering Sea, for instance, in which the navy has long been accustomed in the old days of small ships with limited engine power it was probably a hazardous trip, and many were the wrecks which glad-

dened the hearts of the savages on the shores of the straits. The old naval officers who spoke occasionally of our trip through the straits undoubtedly gained their experience of them in small ships; and lay writers in our own and the foreign press have probably exaggerated the sailing directions or ancient books of travel and adventure. The Straits of Magellan, and the weather there, have not changed in the least, but ships have. The fleet encountered this supposed ordeal as it has everything else so far—uneventfully. We went right along at the usual 400 yards distance, and with no variation from the strict requirements of the straits.

It is two hundred miles from Sandy Point to Cape Pillar, the west end of the straits. We covered that distance in twenty hours if I read somewhere that the last sailing vessel to go through made it in eighty-six days!

There was some indignation and not a little amusement in the fleet when we saw at Rio de Janeiro published in our home papers that an experienced merchant captain had been sent down to take the fleet through the straits. From the subsequent issues of the papers that we saw we gathered that the public was incensed because we needed a pilot to go through the straits. I am told that Admiral Evans characteristically remarked that if he couldn't take the fleet through, there were, luckily, plenty of others in the fleet who could. As a matter of fact, Captain Osterhaus of the *Connecticut*, and his navigator, Lieutenant-Commander Day, took the *Connecticut* through the straits, and we all followed like lambs after the one above. As regards the emergency sailing of the flag-ship was the admiral, upon whom by all the responsibility.

It is usual on entering the Pacific Ocean from the straits to encounter a gale. The *Tacoma* and *Washington* had done so, though at a slightly more unfavorable season, and the order was therefore given to make every preparation to meet a heavy gale. So the ventilators forward were taken down, hatches and turrets closed up, and everything movable was snugly secured.

This was a wise precaution, but it proved unnecessary. We met nothing but good weather, though it was misty and rainy, and reasonably foggy.

So ended the passage of the Magellan Straits by the Atlantic fleet—not become a Pacific fleet.

THE BANQUET GIVEN TO MRS. HUMPHRY WARD BY THE PLAYGROUND ASSOCIATION OF AMERICA

THE PERSONS INDICATED BY NUMBERS IN THE PHOTOGRAPH ABOVE ARE AS FOLLOWS: 1, MRS. HUMPHRY WARD; 2, THE SUCHESS OF HARTINGSTON; 3, MR. EDWARD WAYSON SELIGER; 4, MR. HUMPHRY WARD; 5, MRS. 2. H. FLICK; 6, MRS. JACOB A. BIRN; 7, DR. W. H. MAXWELL; 8, MR. CUNO M. RUDOLPH; 9, MISS JANE ADAMS; 10, MR. ROBERT W. DE FOREST; 11, MRS. GEORGE WHITE FIELD; 12, DR. NEYH T. STEWART; 13, MR. JAMES SPETER; 14, MRS. G. H. P. BELMONT; 15, MRS. W. K. VANDERBILT, JR.; 16, MRS. JAMES SPETER; 17, MR. G. M. P. BELMONT; 18, MR. RALPH FULTZER; 19, MISS ANNE MORGAN; 20, MRS. W. G. WEISS; 21, MR. FRANK S. WEISS; 22, MISS ELIZABETH MARETT; 23, MRS. RALPH FULTZER; 24, MR. W. K. VANDERBILT, JR.

MRS. HUMPHRY WARD, who is now visiting America, was the guest of honor at a dinner recently given for her at the Waldorf-Astoria, New York, by the Playground Association of America, of which Mrs. Ward is an honorary member. The distinguished married read an address on the subject of "Playgrounds in England," in which she told of the increasing attention that is being given abroad to the work of providing recreation

facilities for the children of the poor, and compared with it the progress that has been made in this respect in the United States. The Duchess of Marlborough, who was present, discussed in a pointed and effective speech, "The Responsibility of Women." In addition to the toastmaster, Mr. Richard Watson Gilber, other speakers at the dinner were Miss Jane Adams, of Chicago, Mrs. George C. Riggs (Kate Douglas Wiggin), and Mr. Jacob A. Birn.

WHEN WOMEN RULED

By VICTOR ROUSSEAU

THERE are, no doubt, arguments of value that may be advanced against the extension of the franchise to women, but these who claim, in effect, that female suffrage would overturn the structure of male dominance, built up since the dawn of history, could hardly put forth a feebler hypothesis. The earliest condition of every race upon the globe has been one of feminine supremacy.

"Contrary to the received usage," writes Diochus Siculus, "the laws permit the Egyptians to marry their sisters, after the manner of birds and bees. . . . The queen receives more power and respect than the king, and . . . among private individuals the woman rules over the man, and it is stipulated by the terms of the dowry contract that the man shall obey the woman." Remains of domestic deeds bear out these assertions.

"It was the custom for the woman to govern the man," wrote Andrew Wright of the Trojans in 1873. "He might be ordered at any moment to take his blanket and pack off." After such a catastrophe, unless some kindly mother-in-law intervened, he had to return to his clan. The women even elected the tribal chief.

It was the growth of the custom of holding personal property which overthrew the woman's rule, and established the system of agnation or inheritance through the males. Hitherto the woman had been supreme in tribe and household. In Dahomey, famous for its female warriors, the royal house inherited through the mother. This was also the custom in Tonga and the islands of Polynesia.

The afterglow of the period of female supremacy is dimly shown

in legends carried down to us from the dawn of history. Atreus came to the relief of Troy. To appease the anger of Poseidon, it was decreed at Athens in the time of Kekrops that women should no longer have the right of voting in the assemblies, and that children should no longer bear the names of their mothers.

Stories in the Old Testament take on a new interest in the light of our present knowledge of this ancient period of feminine rule. According to Genesis 2:24, a man shall leave his father and mother and cleave in his wife. Now, this does not mean that they shall set up house-keeping together; it is set a stir upon the primitive mother-in-law. It means that he must leave his clan and enter that of his wife. So, too, we understand the tribulations of Jacob. When this patriarch stole away with his two wives, Leah and Rachel, from the home of his father-in-law, he was committing the most heinous of all offenses, for his marriage had made him a member of his wife's clan. He had become their property. And, much later in history, Samson marries a woman in Philistia, and has to go there to visit her.

"Woman," says Tertullian, "then art the gate of hell." It is unnecessary to quote the well known opinions of the fathers in this respect. The stern provisions of the Christian jurists came into conflict with the milder customs of the barbarians. Among the Visigoths, Havarians, and Burgundians no male kinsman could interfere with the wife's guardianship of her children.

According to Macaulay, the anthropologist, the average criminal capacity in cubic centimeters of men in the stone age was 1544, as against 1580 of modern Europeans; that of women in the stone age was 1422, as against only 1338 today.

Madame de Billion's Easter Costume

By JOHN KENDRICK BANGS

DRAWINGS BY F. STROTHMANN

Poor Madame de Billion,
the times were so hard
She found it distasteful to
live by the card.
Her husband's cold cash was
locked up in the bank
Of the Crackerjack Trust,
And all of his bonds and in-
dustrial stocks
Were scattered around in "Se-
curity Hocks,"
Not a dollar in sight
To ease off the plight,
With Easter approaching next
Saturday night!
De B. didn't care... he's a self-
ish old man,
Who lives to enjoy all the fun
that he can.

And goes to the Club for his wine and dining,
And pays for it all by just signing and signing.

Wining and signing

Her bills were so large at both
Dressen's and Gore's,
And also at all of the rest of
the stores,

They'd shut off her credit, and,
with little respect,

Send around to collect
Quite a number of folks whom
'twas hard to resist,
Who'd never been put on her
visiting list.

While Madame Von Feather,
Who made all her hats, had
closed up altogether,
So nowhere in town—how it
filled her with loathing!—
Would any one send her a
scrap of new clothing
In which to appear at St.
Swithin's next Sunday,
And dazzle the eyes of the old
Lady Grundy.

Of course she had plenty of
gowns and creations

By modistes of all the sartorial
nations,

But nothing she hadn't already
once worn,

would fill her with scorn,

A chapeau she made

That saved all her troubles,
and saved her digestion
Beyond any question.
A chapeau she made
Of the parlor lamp-shade!
For feathers, a buster
Plucked out of the family bric-
a-brac duster,
A hat I must say that not only
was cunning,

But stunning.
Her waist was a dream, made
of delicate lace
From curtains of windows, and
old pillow cases.

Where no one would miss 'em,
and showed off her tigger

In fashion de rigueur;
And then for a skirt, an old
rose portiere,

Or rather a pair,
Were draped in the jauntiest
possible air.

For things that are jaunty the maid of Poree
Is 'way up in Gee.

The maid of Poree

Then for a skirt

A girdle of curtain-ropes, hinting
dull red,

With knobs at the ends from
the baby's brass bed.

Completed a skirt
So rich it made others look
tawdry and pert;

As chaste and as chic
As the best japonique.

A cutaway coat, with a spar-
rowish tail,

That used to be worn by her
brother at Yale,

Embroidered in front, and be-
hind, and all over

With braid from her grand-
mother's old-fashioned sofa.

In patterns suggesting the use
of some dope

Kaleidoscope,
With a wee little vest

Dug out of a chest

Of duds that De Billion was constantly sporting
In days long ago when he came to her courting.

Topped off the whole thing. I
neglected to say

The spats that she wore were
of yellowish gray,

And made both her shoes
Resemble a couple of fine char-
lotte rozes.

Fresh, sweet, and untainted,
Her uppers she painted!

These done, she was ready, and
went to the service

Both calm and contented, and
not at all nervous,

And none would have guessed
from her bearing majestic

The gown that she wore was
improvised domestic,

And every one said, as they
noted her garments!

"De Billion's a wonder, the
beastly old varmint!

No trouble can break him, it's
rottenly funny

To think where he gets such a big wad of money!

We're skimping, and scamping, and scrooging, but he
Keeps his wife dressed as well as the Queen of Sheba!"

Not at all nervous

And to wear them again, that
And weaken, no doubt, much
her social position

'Twas those who are fighting
the games of Perdition.

Miss Lemon, for instance, who
sits in the pew

Behind her would know that
the gown wasn't new.

And every one knows that Miss
Lemon's a teaser,

And to get juicy gossip you
don't have to squeeze her!

Poor Madame De Billion! 'Twas
an awful dilemma,

And filled her with many a
shiver and tremor;

And then in a moment a glad
inspiration

Arrived to relieve her most sad
situation.

Her maid was a wonder, and
gave a suggestion

Pink Lemonade and Philosophy

By

JOHN S. LOPEZ

DRAWINGS BY
H. B. WATSON

BY H. B. WATSON

"YOU do me an injustice," said the Serious Student in a hurt tone. "It is not only because I have free passes. But here is the only form of public entertainment which has remained practically unchanged. The mountebanks, the jester, and the acrobat of the middle ages all are prototypes of the principal performers in the circus of to-day. Their viewpoint may show us why public taste in entertainment has not improved. Of course, if you do not care to accompany me—"

There was nothing to do but pacify him by going along. All during the trip to the outskirts of Brooklyn he continued his enthusiastic efforts to harness up the past to the present. Not even the unpleasantly chilly drizzle discouraged him.

"So much the better," he argued; "the circus people will have time to converse with us."

But it was only half an hour till show time, and "hustle" was in the air. The performers were too busy to be interrupted, explained his friend the press agent; we could walk around and talk to the attractions. It was not until the man in charge of the monkey cage told him gruffly to "move on and not block the tent" that the Student finally gave up.

Just then the persuasive tones of the portly individual in charge of the lemonade stand drew our attention. He was hawking to little purpose, we noted, for few of the dampened multitude that swept by vouchsafed him even a look. Immediately the Student's air of dejection faded.

"I had forgotten him," he said; "one of the most ancient and inevitable institutions of the circus, yet sufficiently apart from it to be a competent critic. He's not busy; we shall learn from him."

As a preliminary the Student purchased two glasses of the virid fluid and relished his change. The portly individual brightened up amiably. When the Student communicated with him on the unseasonable weather, it became obvious that the Pink Lemonade

Man's blatant exterior hid a sensitive soul; he had been depressed, discouraged, and he welcomed sympathy.

"It's fierce," he replied, suspending the larking. "It's three days now, and if it don't stop, I'll be cramped. It keeps you busy trying not to lose a sale—"

He lapsed ingratiatingly to a tall angular woman who was peering through steel-rimmed spectacles at a lemonade tab, while she held tightly by the hand a primly starched little girl.

"No'm; no coloring matter in it to hurt the insides. It's made of the new stylish lemons grown in California by Mr. Burbank specially for the Four Hundred pink teas. Here ye are, Jimmy, two glasses."

He interpreted the Student's expression and explained:

"Got to do it since that blamed quacker Wiley turned loose his pure food wrinkle. The stiff that's nursing a weary existence on exorbitant breakfast foods and savoury coffee blows ahead and wants to know all kinds of food things—if the lemonade contains lemonade of dynamite, formaldehyde, or any of the popular embalming fluids. I can't tell 'em the truth—that those things is too expensive to put in our product; so I have to square it more artistic and picturesque."

"The art is to conceal art," murmured the Student.

"Exactly," went on the Pink Lemonade Man; "but you've got to be careful nowadays. I get wise that most of those who comes up representing 'emself as food inspectors and consuming samples in be sure it was O.K. was grafters. No I get reckless. A smooth sales-man sold me a job lot of patent lemonade powder at sixty cents a pound, which makes sixty gallons. Well, there's a rush on, so we make it up and deal it out, regardless. They what happens. Along comes a stiff an' buys a glass an' pours it into a bottle. He's back in about two hours with a constable who pinches me for violating the pure food laws."

"I don't say nothin' while the stiff sings a long wail to the judge about my 'liquide lein' full of saccharine. But I'm remembering some patent medicine dope I once read trustfully, so I pull a line of expert chemistry for a delense, and get turned loose—"

"Here you are! Here you are! Scientific lemonade for the children! (Jimmy, tend to business.) That's it—a glass for each of the youngsters and one for yourself, of course."

The Pink Lemonade Man turned to us and said, sotto voce:

"I know that fat old guy was yearning for a chance to get up against our goods. You could tell by the way he slowed up when he dragged the kids by. I'd 'a' lost him in a minute."

"Lost him," I said; "how?"

"Well, he'd 'a' been ashamed to stop unless the kids put up a howl. Same way about comin' to the circus. The old guy lets us on it's too undignified for their own amusement, but they stir their kids up with ambition to go, so at the last minute they can show how kind-hearted and self-sacrificin' they are, by takin' 'em. Thas they get 'em here and manage to attract their attention in all the lemonade and peanuts and other circus delensers which they yearn for. Consequence, there's a constant howl which is stifled with the goods. As the old ones has bigger capacities, they survive; but the kids is sick next day. We get all the blame, when, start to finish, it's the fault of these old hypocrites."

The Student was duly impressed, but I could tell there was something on his mind. Finally he spoke.

"You spoke of a rheumatic delense," he remarked with significant carelessness; "what was it? I mean in the pure food case."

"Oh," said the Pink Lemonade Man, "sax mean about the saccharine." Well, I admitted it, and said we used saccharine purely for the scientific reason that there was thousands of victims of diabetes and Bright's disease which regular sugar would be poison to. Also I invited the judge in come to the show at my expense and taste the goods himself."

"Will you look at that cheap skate flitting that slice of bacon out of his glass and blowing it up!" He beckoned to Jimmy, who was at the other end of the stand. "If you ain't careful about dipping up them lemons, you're fired. I could make some money if it wasn't for you."

"It's things like that," he said, tazing to us, "that keeps me

"The kids is sick next day. We get the blame"

poor. Besides, it makes it too risky to use them new paper-mashy articles I hear is on the market."

We looked our incredulity.

"Sure," asserted the Pink Lemonade Man, with a superior smile; "though I ain't never used 'em. Had one experience with fake ice that made me leery of them devices."

"It's an awful hot summer day, and we're in one of them little jay bums where the local ice supply is cornered by the ice-cream store and the undertaker. The former won't ever loosen up, 'sevin' they figure on controlin' the coolin' refreshments while the show is in town; and the undertaker trustin' he'll need his after it's gone. Well, we manage to dig up a little from a farmer, but 'sevin' it's a sterling day, our display is pitiful. The natives have drove in for a holiday and they're making a constant yell for more ice to flush the dust out of their throats. I got another helper with me then, an' he's an Edison in the lemonade biz. Says he:

"Regards for cracked ice is all imagination. Break up some of them thick glass insulators which will look like ice. We'll fill the glasses with it, then top off with some real ice, and fill up with lemonade. Besides, it'll be savin'."

"Nay, the effect is great! You get a merry shink-shink on the side of the glass that would bring joy to a man the morning after. I'm figurin' on raisin' the boy's salary."

"It's in the evening, that sold him one of them rural types that raises a crop of face affairs in order to save the expense of shavin'. With him in three kids which threaten to grow up the same. He hovers around the stand five minutes before he gets courage to buy. Then it's one glass he orders."

"I'm watchin' proceedings, which consists of takin' a sip all around. Then I'm hesitin' to see the old skate dip into the glass and begin to whack up the cracked ice. The old fellow goes up against a fawner piece, and the first thing you know there's a yell that starts a pause in the wild animal treat. It's hit down with a loun tooth and broke it off. 'Sevin' the village constable's present, I'm pinched, and it costs me two hundred for permission to leave the leery."

"You must come to understand the circus profession pretty well," suggested the Student, still incredulous of his purpose.

"Lemons," said the Pink Lemonade Man, "is my profession—and first and last, I've had a good many handed me."

"Take it from me, there's four-fishers in this business, same as any other. I don't wonder you smile; but it's a straight goods. Why, there's the game 'Smooth Al,' one of the ticket men, put up in us lemonade men. There's four of us boys the privilege. Anderson, that's selling across the tent, gets wise that our business is always hurt by the home talent, which makes up lemonade and peddles it outside for half price. An' he does out how he can prevent it by combinin' forces. This is that we send a man to see the small bugs a day ahead of the show, and buy up every lemon is right. This ain't difficult, 'sevin' there's usually about three stores that keep lemons, and the supply ain't staggerin'."

"Immediately we notice business picks up, and besides we don't lose neither. There's usually been such a demand for lemons that the grocers is glad to lay them back at full price when we leave."

"By and by we get tackling bigger villages, and then notice that we got to buy a lot of lemons that we can't unload afterwards. Reports is there's always one or two men with a big supply on hand for which they want prices."

"Well, the thing comes out. 'Smooth Al' is doin' us dirt. He's got wise to our method, and is the one shadin' in those big benches of lemons. He's had some sent to bums for three weeks ahead, and they're distributed by a sneaky lithographer who gets around a day ahead of our man, and appoints agents. But we stung him all right. We stopped buying for four weeks, which about covered Al's supply. At the end of that time he had about six billion on hand, which he was glad to unload on us at very bargain prices."

"Do you find your—profession profitable?" I asked.

"Business has been rotten so far this season, but it'll pick up from now on. The show jumps out through territory where all the towns mostly is prohibition."

"Ah!" ejaculated the Student, delightedly; "so you find that in those places the people really prefer lemonade to stronger drink?"

The Pink Lemonade Man fought nonchalantly. "Profer it?" he chorled. "Well, not by a damn sight. The ain't consumes quantities of it for the same reason they voted for prohibition. It's advertising. In them rubber-neck communities all the old sanctified dame knows what everybody does. So the men folks have to vote for prohibition or he bid up as town drunkards. 'Course in they fall up around a lemonade stand to keep up the bluff, and we benefit. It's amusin' to see them victims outpacing the stuff under the counter, same as the wise members of a Sixth Avenue Saturday night reunion."

"There's some men unscrupulous enough to swindle them unfortunately in a most heartless and disappointed way. They'll have one level of fluid colored red like ink. They recommend this to the men, with a very suggestive side wink, as 'tonic lemonade' at ten

cents per. Of course, it's only lemonade, but the poor victim can't make a holler, 'sevin' their chaperones is present."

The Student had been gazing at the Pink Lemonade Man's right hand, on which sparkled a big diamond, which he adjusted frequently so that it would show to advantage.

"Fine stone you have," he remarked. "I have heard, I think, that diamonds are rather popular with circus people."

"Most performers," said the Pink Lemonade Man, "soak away their spare change in sparklers so as to have somethin' to hock if they go broke. I flash mine mostly for business reasons, though I ain't denyin' I've converted it at times. Diamonds adds dignity, specially in small towns, where they can only recognize a gentleman because he wears a high hat, patent leather shoes, and swell clothes. Besides, it makes 'em feel easier to let 'em are you trustin' a 'fin' sparkler like that in the liquids you're sellin' 'em."

Here a shower of sawdust fell about us. Two boys were fighting in front of the stand, rolling on the ground and pelting each other with sawdust.

"Well, I'll be—!" began the Pink Lemonade Man, as a quantity of it landed in one of the tubs. Then he smiled philosophically.

"It'll draw a crowd, and maybe I'll land some of 'em. Here, Jimmy," he called loudly to his assistant, "take this tub over to the dressing tent and empty it."

"What he'll do," he confided, "is strain it through a cheesecloth we keep on purpose. He'll bring it back in a minute, that is, unless Mademoiselle Fleurette is hanging round."

The Serious Student beamed.

"Are there many little romances around the circus?" he asked, eagerly. "I presume she is his sweetheart?"

The Pink Lemonade Man threw back his head and gave up to such explosive and sprinkling mirth that I shuddered for the lemonade.

"If Jimmy heard you," he finally managed to splutter, "he'd probably try to bust your jaw in. Mademoiselle Fleurette's a young man. Him an' Jimmy inter be pals, but now most every time they meet there's a scrap. Fleurette's got a swelled head an' puts on airs. Jimmy gets back at him by insinuations concernin' him passin' for a prefer' lady."

I shared the Student's obvious amazement, but it was he who voiced our curiosity.

"They fall up against a lemonade stand to keep up the bluff!"

"Nix, he ain't the bearded lady," replied the Pink Lemonade Man. He wiped the evidences of great emotion from his eyes with the back of his hand, erased three patrons with such preoccupation that he neglected to fill the glasses, and then returned with mysterious mien.

"You got to promise to say nothin' till the show leaves," he stipulated, one hand shielding his mouth in a theatrically confidential manner. We promised.

"Well," he confided, "Fleurette is at present what you see all over the billboards as 'The Dainty Parisienne in the Double Sensation. Death-defying. Whirlin' Leap for Life.' Just before the accident his name was Dugan—Mike Dugan, an' he run away from home with Jimmy to join the circus."

"Accident?" we gasped, simultaneously.

"Cert," said the Pink Lemonade Man; "that's what made him a star. He'd been a circus man, working twenty six hours a day. One day there was trouble placin' one of the big poles, and they

The Charm of Eastertide at Atlantic City

By JOHN STEEVENS

DRAWINGS BY VERNON HOWE BAILEY

DURING two weeks of each recurring spring-time—the week preceding and the week following Easter, Sunday—the native spirit of America vanishes from Atlantic City, and in its place suddenly appears, from nowhere and everywhere, a sprle whims habitant in Paris—the Paris of gayety, color, music; of laughter and chat; of costumes and cafes, of dancing and merriment, of "farewell-to-yesterday, and the devil-take-to-morrow!" Why this giddy little spirit should have selected Atlantic City, some years ago, as a place wherein to settle down for a fortnight each spring and to hold jester's court no man knoweth, and none attempteth to guess. But that he comes is fact; and that some thousands of men and women come to welcome him is also fact, for the great majority see him in his home every year or two, and they seize the annual opportunity to see him here, to imbibe of his ever-flowing gality, to breathe of his atmosphere of lightness, and to share his care-free life.

Nowhere else, certainly not in the eastern part of the United States, does the Easter season come with such a sudden burst of joyousness, such a fountain of renewed vitality, as at Atlantic City. During the few hot months of the year this cosmopolitan old resort is humming, roaring, shouting, with good humor on the part of millions of visitors from all over the land. The immense boardwalk is filled in the morning, crowded in the late afternoon, and almost jammed at night; beach shoes, pavilions, piers,—all the thousand-and-one opportunities for an hour's enjoyment—are in full blast. The latest yachts are loaded to their capacity; the bathing grounds are swarmed; hotels, boarding-houses, cottages of high and low degree are filled to overflowing with guests booked far in advance; and excursionists from a score of cities and towns come by thousands to spend but a day, and return home at night. Such, in brief, is Atlantic City for one part of the year. And then, excepting for a comparatively few of the best hotels, the town practically shuts down its activities, puts on a cloak of quiet gray—gray sand, gray sea, neutral sky-effects—during the long winter. To be sure, people do come down here in the cold season, the season of sharp, bracing winds and menacing, tumultuous, smothering seas; but they are a handful compared with the summer multitudes. The latter part of January and February are

more and more arriving—business and professional men who know they need rest, and take it as a regular matter of business; women and children who need a change of scene and air, or who can easily convince their families of the apparent need. And all these folk enjoy themselves keenly, rationally; for the best of the hoteleries are never closed, and good living and good music and general good cheer are conducive to rational enjoyment. And it is during the week preceding and the week following Easter Sunday that Atlantic City shows its individuality. Its clear-cut distinction from any other resort in America.

You who are worldly-wise readers of newspapers and periodicals, and who therefore read the advertising columns as habitually as you read the news columns and editorials, may have noticed that for a month preceding Easter there appear now and then moderate reminders of Atlantic City as a spring resort. But you also note that there is as such carefully-planned, elaborate, extensive, and expensive advertising as appears later on in the summer when the hotels and boarding-houses exert themselves to draw guests thither. The reason is easy to determine. Atlantic City needs no Easterlike advertising. It has, during the two Easter weeks, all the guests its leading hotels can accommodate, and those who neglect to secure quarters far in advance are turned away. Its leading hotels, I say, and for the very good reason that mightily few of the other kind are open at Easter. And only the best are open, for the further good reason that practically all of the Easter guests here are people of wealth and fashion from fourteen States, who come regu-

larly, year after year, regarding their sojourn something in the same way they regard the opera season—as a regular function of high social importance. They are accustomed to the best at home, are these folk, and they demand the best here—and get it. Nothing is too costly, nothing too elaborate, so long as it approaches perfection in quality and service. Seventy-five per cent. of their names figure in the social registers of their home cities. An equally large percentage figure on boards of directors, on lists of patronesses for a hundred different undertakings in social, philanthropic, educational, and charitable affairs. They have had a long, strenuous winter, most of these men and women, and they come down here to regain elasticity of spirit. They don't have to seek long for elasticity, either. An hour's ride in one of the great boardwalk chairs, if you are not feeling quite "up to snuff," or a fair mile tramp at a swinging gait along that great avenue, will bring good red blood rushing

The Pleasure Craft at the Inlet

Atlantic City's far-famed Boardwalk, with its strolling, idling thousands of visitors

through one's body from crown to toes, and somewhere in between—everywhere, in fact—a ravenous longing to get into the dining-room as soon as luncheon is served, and to stay there no longer as possible. But this is only for the first morning. After that you take the boardwalk, and the appetite as matters of course; and begin to enjoy yourself. You can't help it, for you find a dozen friends and acquaintances in your own hotel, and you meet twice that many staying elsewhere. Over at the Country Club is golf for the taking, and a course so noted that the enthusiast has little time for night else while daylight lasts. Down on the beach are piers and shacks and ready for use, as well as others harnessed to phantoms; and a gay sight it is, this broad, hard band of sand, with the thronged boardwalk on one side, and on the other the tumbling breakers and hissing tide. Big folks, little folks, old and young, are there these gorgeous afternoons, driving solitarily in basket-carts, or urging faster and faster the scampering ponies, while others stroll along close to the water's edge picking up shells, digging for possible claims of the early spring varieties, or just doing nothing, thinking nothing, dreaming of nothing, while the great, deep undertone of the sea sounds responsive.

Far out there, beyond the line of breakers, are white sails and gay pennants, and graceful hulls skimming along, mostly ships from the big light that marks the northern boundary of Atlantic City. And if you go up to the inlet, passing the sentinel light-house that stands so grave and dignified on the way you will find a score of pleasure craft tugging at their moorings, dancing with pleasure at the thought of being off with a cargo of guests; and

there you will find others darting hither and thither in the great, smooth inlet with no swell, no pitching or tossing to divert the minds—or other things—of those who have lunched long and well.

Doing, perhaps, to the course of the Gulf Stream, or to any one of a dozen other possible causes, the warm breath of springtime comes to Atlantic City earlier than to New York, Philadelphia, Boston, Pittsburg, Chicago, or other Northern cities. When Easter is almost at hand the good folk of these and many like communities long to feel something that is real, not illusory; to be able to go outdoors soon after breakfast minus coats and wraps, to stroll along the boardwalk, or lounge in the shops inspecting curios and objects of art from the world over. They welcome the chance to breathe in great draughts of salt-laden air which has tonic qualities but no beastly stiver in it. So they come to Atlantic City. The men with the hoe is not in evidence, but the man with the gun is; and he early steals off quietly to the marshy lands, where birds may be had by the skilled. Also the man with the hook and line is here at Easter-time—scores and hundreds of him; and there are boats and guides and bait and fish (not merely "fishin'") for him, too.

Bowling alleys? Blow your soul, yes—plenty of them, and all in demand, morning, noon, and night. Bridge? Sure thing, and plenty of bridge-enthusiasts, if you want to join them. The piers are open, too, or the principal ones; and sailors or seamen who would never think of such a thing at home put on roller-skates and whirl around and around the great rink, happy-go-lucky as a crowd of children, regardless as to whether school keeps or not, forgetful—

thankfully forgetful—of ordinary convention and corresponding useless restrictions of ordinary life. There is music, too, in such places, morning, afternoon, and night. On one of the piers especially there is music—some of the best bands to be obtained in the country, and its services are obtained only because the hotel proprietors club together, and thus subscribe sufficient sum to pay for it. And this band plays, plays well, while one section of the visiting community is skating, and other and much larger sections, in gay groups or confidential *tête-à-tête*, are comfortably ensconced near by, where they can listen and chat, or look out upon the swelling green waves that sweep shoreward beneath the pier.

It is, of course, after dinner, in the late evenings, that one feels to the full the spirit of frolic and gaiety during Easteride in Atlantic City. Then the great hotels are ablaze with light, the corridors are shimmering with gay costumes, the air is laden with string music and the delicate odor of flowers. The boardwalk outside is bright with countless cars, and the cafes are thronged. You may see, at other times, much the same kind of a crowd in a few hotels in New York—on New-year's Eve, for instance. You may see it almost any time during the season in Paris. But nowhere else in America do you see it and enjoy it, as a whole, so much as at Atlantic City during Easter week. The very air is alive and sparkles with effervescence; it seems as if some magic hand has drawn away the curtain of dull care that is supposed to be ever-present with Americans, and replaced it with the myriad-colored costume of Mademoiselle Folly at her prettiest and preperest. For there is this difference between Atlantic

City's cafes and those of Paris—you can safely take your wife and daughter into any of those of the former where Easter crowds congregate, whereas one would think twice before taking them into all the cafes of the French capital.

Of course the great event of Easteride down here by the sea, the one greatest event, strange to say, is not a ball or a series of races on land or on water, but simply a leisurely stroll along the boardwalk—the parade of Easter Sunday. Years and years ago, the Easter parade on Fifth Avenue used to be looked forward to and taken part in by some thousands of fashionable folk, and Monday's newspapers used to devote columns of space to it as a whole and to its most prominent individuals, with more or less successful attempt on the part of the reporter to tell whether Mrs. Plaza and her charming daughters were pompous-bazille cut to the polka-dot; and to-day the Easter Sunday parade figures with some seriousness of purpose in Philadelphia, it is said. Whatever may be the custom, or lack of it, elsewhere, the parade in all its glory still takes place down here by the shore; and it is a carnival such as was never dreamed of by New York, even in the palmy days

The Beach and the never-silent Sea

younger wife passed along the boards in amicable and animated conversation with a dignified Hindu who held his flowing robes carefully in the balmy salt breeze. But of course the great majority of the paraders are from points east of Pittsburgh, south of Portland, Maine, and north of Richmond. They come and go, passing in straws, eddies, groups, rades; individuals passing here to greet unexpected friends while the human currents swirl around them; swinging off in this direction, retreating in that—a vast, intermingling, comprehensive tide of life and laughter and brightness, brads which that great monotonous salty tide at the edge of the beach sinks into sulken, blinding insignificance.

The Easter parade over, the Easter church services concluded, the Easter evening passed, Atlantic City awakens Monday morning with a shout, "on with the dancet!" And the dance is had in a multitude of social functions. Day after day, night after night—and when Friday and Saturday come the thousands are leaving for home, the crowds are swelling away from hotels, piers, boardwalk, beach, inlet, and country club. Then one wakes up to the fact that the spring sink is all over, and nothing much will be doing until the summer weather arrives. Just why this is so, why Atlantic City should be so sparsely populated with guests during May and early June is a mystery. For in these six weeks the resort is literally at its very best and highest state of efficiency. By this time all the hotels are ready for business—they have to be ready then. The furnishing and decorations are unused, macarred, and maimed. Everything is bright with new paint, everybody of the permanent population is ready for the upcoming hosts of visitors; the shops have their new stock laid in and displayed, the boardwalk attractions are in order, and the last dab of brush and pressure of polishing cloth has been given to the wood and brasswork of the inlet yachts.

A few of the canny ones come here in May and in early June, and a few more are coming each year. If the pleasure-loving populace of the country knew what was to be found here in these six weeks it would come down by tens of thousands. For there are thousands of Americans who think of Atlantic City only in its midsummer aspect—thronged to the guard rails, boisterous, rollicking, its action, always in action, restless as the sea itself. Such it is in the heated term. But the Atlantic City of May and early June is as different as if it were in a foreign country.

The Haven of Hundreds of Guests

A Spirit in Prison*

A Novel

By Robert Hichens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER IX

"ONA sera, signorina."

"Buona sera, Ruffo."

"She did not bring surprise when he came up to her.

"No you fish at night?" she said. "I thought the divers for *frutti di mare* did not do that."

"Signorina, I have been taken into the boat of Masolino Giuseppe."

He spoke rather proudly, and evidently thought she would know of whom he was telling her. "I fish for sardie now."

"Is that better for you?"

"Si, signorina, of course."

"I am glad of that."

"No, signorina."

He stood beside her quite at his ease. To-night he had on a cap, but it was pushed well off his brow, and showed plenty of his thick dark hair.

"When did you see me?" she asked.

"Almost directly, signorina."

"And what made you look up?"

"Signorina?"

"Why did you look up directly?"

"Not to see, signorina."

"I think it was because I made you feel that I was there," she said. "I think you obey me without knowing it. You did the same the other day."

"Perhaps, signorina."

"Have you smoked all the cigarettes?"

She saw him smile, showing his teeth.

"No, signorina, long ago. I smoked them the same day."

"You shouldn't. It is bad for a boy, and you are younger than I am, you know."

"The smile grew wider.

"What are you laughing at?"

"I don't know, signorina."

"Do you think it is funny to be younger than I am?"

"No, signorina."

"I suppose you feel quite as if you were a man?"

"If I could not work as well as a man Giuseppe would not have taken me into his boat. But of course with a lady it is all different. A lady does not have to work. Poor women get old very soon, signorina."

"Your mother, is she old?"

"My mamma! I don't know. Yes, I suppose she is rather old." He seemed to be considering.

"No, signorina, my mamma is rather old. But then she has had a lot of trouble, my poor mamma!"

"I am sorry, is she like you?"

"I don't know, signorina; I have never thought about it. What does it matter?"

"It may not matter, but such things are interesting sometimes."

"Are they, signorina?"

Then, evidently with a polite desire to please her and carry on the conversation in the direction indicated by her, he said, "And are you like your signora madre, signorina?"

Vere felt inclined to smile, but she answered, quite seriously: "I don't believe I am. My mother is very tall, much taller than I am, and not so dark. My eyes are much darker than hers and quite different."

"I think you have the eyes of a Sicilian, signorina."

Again Vere was conscious of a simple effort on the part of the boy to be gallant. And he had a good memory too. He had not forgotten her three-day-old claim to Sicilian blood. The slight mitigated the blunders of his transparency. It seemed. Vere could not help being pleased. There was something in her that ever turned towards the Sicily she had never seen. And this boy had not seen Sicily, either.

"Isn't it odd that you and I have never seen Sicily?" she said, "and that both our mothers have? And mine is all English, you know."

"My mamma would be very glad to kiss the hand of your signora mother," replied Ruffo. "I told her about the kind ladies who gave me cigarettes, and that the signorina had never seen her father. When she heard that the signorina was been after her father was dead, and that her father had died in Sicily, she said—'my poor mamma!—'ff ever I see the signorina's mother, I shall

kiss her hand. She was a widow before she was a mother, my the Madonna comfort her.' My mamma spoke just like that, signorina. And then she cried for a long time. But when patrigeo came in she stopped crying at once."

"Did she? Why was that?"

"I don't know, signorina."

Vere was silent for a moment. Then she said:

"Is your patrigeo kind to you, Ruffo?"

The boy looked at her, then swiftly looked away.

"Kind enough, signorina," he answered.

Then they both kept silence. They were standing side by side then, looking down rather vaguely at the Nalati's Pool, when another boat floated gently into it, going over to the far side, where already lay the two boats at the foot of San Francesco. Vere saw it with indifference. She was accustomed to the advent of the fishermen at this hour. Ruffo stared at it for a moment with a critical, inquiring gaze. The boat drew up near the land and stopped. There was a faint murmur of voices, then silence again.

The Marchesino had told the two sailors that they could have as much or as little of sleep before beginning to fish.

The men lay down, shut their eyes, and seemed to sleep at once. But Artide and the Marchesino, lounging on a pile of rugs deftly arranged in the bottom of the stern of the boat, smoked their cigars in a silence laid upon them by the night silence of the Pool. Neither of them had as yet caught sight of the figures of Vere and Ruffo which were becoming more clearly relieved as the moon rose and brought a larger world within the radiance of its light. Artide was satisfied that the members of the Casa del Mare were in bed. As they approached the house he had seen no light from its windows. The silence about the islet was profound, and gave him the impression of being in the very heart of the night. What had he anticipated? What had he expected of this expedition? He had been, as usual, politely waiting on bedstead. He had come to the islet in the hope that destiny would meet him there and treat him with every kindness and hospitality, forestalling his desires. But let! he was abandoned in a boat among a lot of turbulent men, while the object of all his thoughts and plans, his plots and hopes, was doubtless harmlessly sealed in the home on the cliff above him.

Several Neapolitan words, familiar in street circles, ran through his mind, but did not issue from his lips, and his face remained perfectly calm—almost scrupulous in expression.

Out of the corner of his eye he stole a glance at "care Emilio." He wished his friend would follow the example of the men and go to sleep. He wanted to feel himself alone in wakefulness and unobserved. For he was not resigned to an empty fate. The voices of the laughing women at the Antico Giuseppe still rang through his memory. He was adventurous by nature. What he would do if Emilio would only chamber he did not know. But it was certain he would do something. The islet, dark and distinct in outline beneath the moon, summoned him. Was he a Neapolitan and not beneath her window? It was absurd. And he was not at all accustomed to control himself or to fight his own impulses.

For the moment "care Emilio" became "malafatto Emilio" in his mind. Sleepless as Frodo, Emilio reclined there. A slightly distracted look came into the Marchesino's eyes as he glanced away from his friend and stared once more at the islet which he longed so ardently to invade.

This time he saw the figures of Vere and Ruffo above him in the moonlight, which now sharply relieved them. He gazed. And as he gazed they moved away from the bridge, going towards the seat where Vere had been before she had seen Ruffo.

Vere had on a white dress.

The heart of the Marchesino leaped. He was sure it was the girl of the white boat. Then the inhabitants of the house on the islet were not asleep, were not even in bed. They—she at least, and that was all he saved for—were out enjoying the moon and the sea. How favorable was the night! But who was with her?

The Marchesino had very keen eyes. And now he used them with almost fierce intensity. But Ruffo was on the far side of

* Reprinted in HARRIS'S WEEKLY, No. 1072.

Vere. It was not possible to discern more than that he was male, and taller than the girl in the white dress.

Jenouisy leaped up in the Marchesino, that quick and almost frivolous jealousy which, in the southerner, can so easily deepen into the deadliness that leads to crime. Not for a moment did he doubt that the man with Vere was a lover. This was a blow which, somehow, he had not expected. The girl in the white boat had looked enchantingly young. When he had played the seal for her she had laughed like a child. Even he, who believed in no one's simplicity, made sceptical by his own naughtiness so early developed towards a fine maturity!—had not expected anything like this. And these English, who pride themselves upon their propriety, their stiffness, their cold respectability! These English misses!

"Ouf!"

It was out of the Marchesino's mouth before he was aware of it, an exclamation of cynical disgust.

"What's the matter, amico mio?" said Artois, in a low voice.

"Niente!" said the Marchesino, recollecting himself. "Are you going to sleep?"

"Yes," said Artois, throwing away his cigar end. "I am. And you?"

"I too!"

The Marchesino was surprised by his friend's reply. He did not understand the desire of Artois not to have his sense of the romance of their situation broken in upon by conversation just then. The romance of Nature was not with Artois, but the romance of Nature was. He wanted to keep it. And now he settled himself a little lower in the boat, under the shadow of its side, and seemed to be giving himself to sleep.

The Marchesino thanked the Madonna, and made his little pretence of slumber too, but he kept his head above the gunwale, leaning it on his arm with a supporting cushion beneath; and though he really did shut both his eyes for a short time, to deceive caro Emilio, he very soon opened them again, and gazed towards the islet. He could not see the two figures now. Raze seized him. First the two men at the Antico Giuseppe, and now this man on the islet! Every one was companioned. Every one was enjoying the night as it was meant to be enjoyed. He alone was the sport of "il maledetto destino." He longed to commit some act of violence. Then he glanced cautiously round without moving.

The two sailors were sleeping. He could hear their regular and rather loud breathing. Artois lay quite still. The Marchesino turned his body very carefully so that he might see the face of his friend. As he did so, Artois, who had been looking straight up at the stars, shut his eyes and simulated sleep. His suspicion of Doro, that this expedition had been undertaken with some hidden motive, was suddenly renewed by this sly and furtive movement, which certainly suggested purpose and the desire to conceal it.

No care Emilio slept very peacefully, and breathed with the calm regularity of a sucking child. But in this sleep of a child he was presently aware that the boat was moving, in fact was being very adroitly moved. Though his eyes were shut he felt the moonlight leave his face presently, and knew they were taken by the shadow of the islet. Then the boat stopped.

A moment later Artois was aware that the boat contained three people instead of four.

The Marchesino had left it to take a little stroll on shore.

Artois lay still. He knew how light in the slumber of women in a boat with the wide airs about them, and felt sure that the sailors must have been waked by the touch of the boat across the Pool. Yet they had not moved, and they continued apparently to sleep. He guessed that a glance from their "padroni" had advised them not to wake. And this was the truth.

At the first movement of the boat both the men had looked up, and had received their message from the Marchesino's expressive eyes. They realised at once that he had some design which he wished to keep from the knowledge of his friend, the fore-sure. Of course it must be connected with a woman. They were not particularly anxious. They had always lived in Naples, and knew their aristocracy. So they merely returned the Marchesino's glance

with one of comprehension and composed themselves once more to repose.

The Marchesino did not come back, and presently Artois lifted himself up a little, and looked out.

The boat was right under the lee of the islet, almost touching the shore, but the sea was so perfectly still that it scarcely moved, and was not in any danger of striking against the rock. The sailors had seen that, too, before they slept again.

Artois sat quite up. He wondered a good deal what his friend was doing. One thing was certain—he was trespassing. The islet belonged to Hermione, and no one had any right to be upon it without her invitation. Artois had that right, and was now considering whether or not he should use it, follow the Marchesino and tell him—that he had not told him—that the owner of the islet was the English friend of whom he had spoken.

For Artois the romance of the night in which he had been revelling was now thoroughly disturbed. He looked again towards the two sailors, suspecting their sleep. Then he got up quietly, and stepped out of the boat on to the shore. His doing so gave a slight impetus to the boat, which floated out a little way into the Pool. But the sea in it seemed to sleep on.

Artois stood still for a moment at the edge of the sea. His great limbs were cramped, and he stretched them. Then he went slowly towards the steps. He reached the plateau before the Casa del Mare. The Marchesino was not there. He looked up at the house. As he did so the front door opened and Hermione came out, wrapped in a white lace shawl.

"Emilio!" she said, stopping with her hand on the door. "Why—how extraordinary!"

She came to him.

"Have you come to pay us a nocturnal visit, or—there's nothing the matter?"

"No," he said.

For perhaps the first time in his life he felt embarrassed with Hermione. He took her hand.

"I don't believe you meant me to know you were here," she said, guided by the extraordinary intuition of women.

"To tell the truth," he answered, "I did not expect to see you. I thought you were all in bed."

"Oh no. I have been on the terrace and in the garden. Vere is out somewhere. I was just going to look for her."

There was a distinct question in her prominent eyes as she fixed them on him.

"No, I haven't seen Vere," he said, answering it.

"Are you alone?" she asked, abruptly.

"No. You remember my mentioning my friend, the Marchesino Panacci? Well, he is with me. We were going to fish. The fishermen suggested our sleeping in the Saint's Pool for an hour or two first. I found them gone, and came to look for him."

There was still a faint embarrassment in his manner.

"I believe you have seen him," he added. "He was bathing the other day when you were passing in the boat,—I think it was you. Did you see a young man who did some tricks in the water?"

"Oh yes, an independent young creature. He pretended to be a porpoise and a seal. He made us laugh. Vere was delighted with him. Is that your friend? Where can he be?"

"Where is Vere?" said Artois.

Their eyes met, and suddenly his embarrassment passed away.

"You don't mean that—?"

"My friend, you know what these Neapolitans are. Doro came back from his bath reeling about Vere. I did not tell him I knew her. I think—I am sure he has guessed it, and much more. Let us go and find him. It seems you are to know him. E' il destino."

"You don't want me to know him?" she said, as they turned away from the house.

"I don't know that there is any real reason why you should not. But my instinct was against the acquaintance. Where can Vere be? Does she often come out alone at night?"

"Very often. Ah! There she is beyond the bridge, and—is that the Marchesino Panacci with her? Why—no, it's—"

"It is Raffaele," Artois said.

Vere and the boy were standing near the edge of the cliff, and talking earnestly together, but as Hermione and Artois came towards them they turned

They turned round as if moved by a mutual impulse

remained as if moved by a mutual impulse. Ruffo took off his cap and Vere cried out:

"Monsieur Emile!"

She came up to him quickly. He noticed that her face looked extraordinarily alive, that her dark eyes were fiery with expression.

"Good evening, Vere," he said.

He took her small hand.

"Buona sera, Ruffo," he added.

He looked from one to the other, and saw the perfect simplicity of both.

"Tell me, Vere," he said; "have you seen any one on the inlet tonight?"

"Yes, just now. Why? What made you think so?"

"Well?"

"A man—a gentleman, come. I told him we was trespassing."

Artois smiled. Ruffo stood by his cap in his hand, looking attentively at Vere, who had spoken in French. She glanced at him, and suddenly broke into Italian.

"He was that absurd boy we saw in the sea, madre, the other day, who pretended to be a seal, and made me laugh. He reminded me of it, and asked me if I didn't recognize him."

"What did you say?"

"I said 'No' and 'Good night.'"

"And did he go?" asked Artois.

"No, he would not go. I don't know what he wanted. He looked quite odd, as if he were feeling angry inside, and didn't wish to show it. And he began trying to talk. Just as I didn't really know him—after all, laughing at a man because he pretends to be a seal is scarcely knowing him, is it, Monsieur Emile?"

"No," he said, smiling at her smile.

"I said 'Good night' again in such a way that he had to go."

"And so he went!" said Artois.

"Yes. Do you know him, Monsieur Emile?"

"Yes. He came with me tonight."

A little look of pensiveness came into the girl's face.

"Oh, I am sorry!"

"Why should you be?"

"Well, he was saying something about knowing friends of mine, or—I didn't really listen very much, because Ruffo was telling me about the sea—and I thought it was all nonsense. He was absurdly complimentary first, you see, and so, when he began about friends, I only said 'Good night' again. And—and I'm really afraid I turned my back upon him. And now he's a friend of yours, Monsieur Emile! I am sorry!"

Already the Marchesino had had that lesson of which Artois had thought in Naples. Artois laughed aloud.

"It doesn't matter, Vere. My friend is not too sensitive."

"Buona sera, signorina! Buona sera, signora! Buon riposo!"

It was Ruffo preparing to go, feeling that he scarcely belonged to this company, although he looked in no way shy, and had been smiling broadly at Vere's narrative of the discomfiture of the Marchesino.

"Ruffo," said Hermione, "you must wait a moment."

"Si, signora?"

"I am going to give you a few more cigarettes."

Vere sent a silent but brilliant "Thank you" to her mother. They all walked towards the house.

Vere and her mother were in front. Artois and Ruffo behind. Artois looked very closely and even curiously at the boy.

"Have I ever seen you before?" he asked, as they came to the bridge.

"Signore?"

"Not the other morning. But have we ever met in Naples?"

"I have seen you pass by sometimes at the Mergellina, signora."

"That must be it, then!" Artois thought. "I have seen you there without consciously noticing you."

"You live there?" he said.

"Si, signora; I live with my mamma and my patrigno."

"Your patrigno," Artois said, merely to continue the conversation. "Then your father is dead?"

"Si, signora, my babbo is dead."

They were on the platform now, before the house.

"If you will wait a moment, Ruffo, I will fetch the cigarettes," said Hermione.

"Let me go, madre," said Vere, eagerly.

"Very well, dear."

The girl ran into the house. As she disappeared they heard a quick step, and the Marchesino came hurrying up from the sea. He took off his hat when he saw Hermione, and stopped.

"I was looking for you, Emile."

He kept his hat in his hand. Evidently he had recovered completely from his lesson. He looked gay and handsome. Artois realized how very completely the young man's desires were being fulfilled. But, of course, the introduction must be made. He made it quietly.

"Marchese Isidoro Panarè—Mrs. Delarey."

The Marchesino bent and kissed Hermione's hand. As he did so Vere came out of the house, her hands full of Khalil Targa cigarettes, her face eager at the thought of giving pleasure to Ruffo.

"This is my daughter, Vere," Hermione said. "Vere, this is the Marchese Isidoro Panarè, a friend of Monsieur Emile's."

The Marchesino went to kiss Vere's hand, and she said:

"I'm very sorry—look!"

She showed him that they were full of cigarettes, and so escaped from the little ceremony. For those watching it was impossible to know whether she wished to avoid the formal salutation of the young man's life or not.

"Here, Ruffo!" she said. She went up to the boy. "Put your hands together."

Ruffo gladly obeyed. He curved his brown hands into a cup, and Vere added this cup with the big cigarettes, while Hermione, Artois, and the Marchesino looked on; each one of them with a fixed attention which—surely—the action scarcely merited. But there was something about these two, Vere and the boy, which held the eyes and the mind.

"Good night, Ruffo. You must carry them to the boat. They'll be crushed if you put them into your trousers pocket."

"Si, signorina!"

He waited a moment. He wanted to salute them, but did not know how to. That was evident. His expressive eyes, his whole face, told it to them.

Artois suddenly set his lips together in his beard. For as instant it seemed to him that the years had rolled back, that he was in London, in Camille's restaurant, that he saw Maurice Delarey, with the extravagant explosion on his face that had been so pleasing. Yes, the boy Ruffo looked like him at that moment, as he stood there, wishing to do his devoir, to be polite, but not knowing how to.

"Never mind, Ruffo." It was Vere's voice. "We understand!—and—laughing look came into her face. She went up to the boy and, with a delicious, childish charm and delicacy that quite removed the action from impertinence, she took his cap off. "There!" She put it gently back on his dark hair. "Now you've been polite to us, buona notte!"

"Buona notte, signorina."

He bent his head off, half laughing, and carrying carefully the cigarettes in his hands still held together like a cup.

Hermione and Artois were smiling. Artois felt something for Vere just then that he could hardly have explained, warmer than he was of the explanation of the fragility of a man. It seemed to him that all the purity, and the beauty, and the whimsical self-consciousness, and the touchiness of youth that is divine, appeared in that little, almost comic action of the girl. He loved her for the action, because she was able to perform it just like that. And something in him suddenly adored youth in a way that seemed new to his heart.

"The boy ran off, when Ruffo had disappeared. "Will you come in? I'm afraid all the servants are in bed, but—"

"No, indeed it is too late," Artois said.

Without being aware of it he spoke with an authority that was almost stern.

"We must be off to our fishing," he added. "Good night. Good night, Vere."

"Good night, signora."

The Marchesino bowed, with his hat in his hand. He kissed Hermione's hand again, but he did not try to take Vere's.

"Good night," Hermione said.

A glance at Artois had told her much that he was thinking.

"Good night, Monsieur Emile," said Vere. "Good night, Marchese. Buona sera!"

She turned and followed her mother into the house.

"The simplices!"

It was the Marchesino's voice, breathing the words through a sigh. "The simplices, signorina!" Then an idea seemed to occur to him, and he looked at his friend reproachfully. "And you have the girl with the perfect little nose, Emile—all the time you knew her?"

"And all the time you knew I knew her!" retorted Artois.

They looked at each other in the eyes and burst out laughing.

"Emile, you are the devil! I will never forgive you. You do not trust me."

"Care again, I do trust you—always to fall in love with every girl you meet. But—and his voice changed—the signorina is a child. Remember that, Emile."

They were going down the steps to the sea. Almost as Artois spoke they reached the bottom, and saw their boat floating in the moonlight nearly in the centre of the Pool. The Marchesino stood still.

"My dear Emile," he said, staring at Artois with his great round eyes, "you make me wonder whether you know women."

Artois felt satisfied.

"Really?" he said.

"Really! and yet you write books."

"Writing books does not always prove that one knows much. But explain to me."

They began to stroll on the narrow space at the sea edge. Close by lay the boat to which Ruffo belonged. The boy was already in it, and they saw him strike a match and light one of the cigarettes. Then he lay back at his ease, smoking, and staring up at the moon.

"A girl of sixteen is not a child, and I am sure the signorina is sixteen. But that is not all. Emile, you do not know the signorina."

Artois repressed a smile. The Marchesino was perfectly in earnest.

"And you—do you know the signorina?" Artois asked.

"Certainly I know her," returned the Marchesino, with gravity. They watched Ruffo's boat. As they did so, the Marchesino glanced at it with a certain knowing impudence that was peculiarly Neapolitan.

"When I came to the top of the inlet the signorina was with that boy," the Marchesino continued.

"Well?" said Artois.

"You see now, don't you? Emile, care."

"I am not angry," said Artois.

Ner was he. It is useless to be angry with racial characteristics, racial points of view. He knew that well. The Marchesino stared at him.

"No, I see you are not."

"The signorina was with that boy. She has talked to him before. He has dived for her! He has sung for her. She has given him cigarettes, taken from her mother's box, with her mother's consent. Everything the signorina does her mother knows and approves of. You saw the signora send the signorina for more cigarettes to give the boy to-night. Ehben?"

"Ehben. They are English!"

And he laughed.

"Madre mia!"

He laughed again, seized his moustaches, twisted them, and went on.

"They are English, but for all that the signorina is a woman. And as to that boy—"

"Perhaps he is a man!"

"Certainly he is. Oh, yes, the boy at least is a Neapolitan."

"No, he isn't."

"He is not!"

"He's a Sicilian."

"How do you know?"

"I was here the other day when he was diving for fruit di mare."

"I have seen him at the Mergellina ever since he was a child."

"He says he is a Sicilian."

"Boys like that say anything if they can get something by it. Perhaps he thought you liked the Sicilians better than the Neapolitans. But anyhow—Sicilian or Neapolitan, it is all one! He is a southerner, and all fifteen a southerner is already a man. I was."

"I know it. But you were proving to me that the signorina is a woman. The fact that she, an English girl, is your friend who that fisher boy does not prove it."

"Ah, well!"

The Marchesino hesitated.

"I had seen the signorina before I came to meet you at the house."

"Had you?"

"Didn't you know it?"

"Yes, I did."

"I knew she told you."

"What?"

"She told you! She told you! She is brilliant. She is a woman, for she pretended as only a woman can pretend."

"What did she pretend?"

"That she was not speaking at my coming, at my finding out where she lived, and seeking her. Why, Emilio, even when I was in the sea, when I was diving the seal, I could read the signorina's character. She showed me from the boat that she wanted me to come, that she wished to know me. Ah, che simpatia! Che simpatia ragazza!"

The Marchesino looked once more at Ruffo.

"Come here a minute!" he said, in a low voice, not wishing to wake the still sleeping fishermen.

The boy jumped lightly out and came to them. When he stood still the Marchesino said, in his broadest Neapolitan:

"Now, then, you tell me the truth! I'm a Neapolitan, not a foreigner. You've seen me for years at the Mergellina."

"No, signore."

"You're a Neapolitan."

"No, signore. I am a Sicilian."

There was a sound of pride in the boy's voice.

"I'm quite sure he speaks the truth," Artola said, in French.

"Why do you come here?" asked the Marchesino.

"Signore, I come to fish."

"For cigarettes?"

"No, signore, for sardes. Buona notte, signore."

He turned away from them with decision and went back to his boat.

"He is a Sicilian," said Artola. "I would swear to it."

"Why? Hark at his accent."

"He is a Sicilian!"

"But why are you so sure?"

Artola only said:

"Are you going to fish?"

"Emilio, I cannot fish to-night. My soul is above such work as fishing. It is indeed. Let me go back to Naples."

"Va bene."

Artola was secretly glad. He, too, had no mind—or was it an

heart!—for fishing that night, after the episode of the boat. They

She came up with a shell cry that startled him.

hailed the sailors, who were really asleep this time, and were soon far out on the path of the moonlight setting their course towards Naples.

CHAPTER X

On the following morning Hermione and Vere went for an excursion to Capri. They were absent from the island for three nights. When they returned they found a card lying upon the table in the little hall—"Marchese faldoro. Parnelli di Toros"—and Gaspare told them that it had been left by a signore, who had called on the day of their departure, and had seemed very disappointed to hear that they were gone.

"I do not know this signore," Gaspare added, rather grimly.

Vere laughed, and suddenly made her eyes look very round, and staring, and impudent.

"He's like that, Gaspare," she said.

"Vere!" said her mother.

Then she added to Gaspare: "The Marchese is a friend of Don Emilio's. Ah! and here is a letter from Don Emilio."

It was lying beside the Marchese's card with some other letters. Hermione opened it first, and read that Artola had been unexpectedly called away to Paris on business, but intended to return to Naples as soon as possible, and to spend the whole summer on the bay.

"I feel specially that this summer I should like to be near you," he wrote. "I hope you wish it."

At the end of the letter there was an allusion to the

Marchesino, "that gay and admirably characteristic Neapolitan product, the Toledo Incarnate."

There was not a word of Vere. Hermione read the letter aloud to Vere, who was standing beside her, evidently hoping to hear it. When she had finished Vere said:

"I am glad Monsieur Emilio will be here all the summer."

"Yes."

"But why specially this summer, madre?" Hermione answered.

"I am not sure what he means by that," Hermione answered. But she remembered the conversation in the Grotto of Virgil, and wondered if her friend thought she needed the comfort of his presence.

"Well, madre?"

Vere's bright eyes were fixed upon her mother.

"Well, Vere? What is it?"

"Is there no message for me from Monsieur Emilio?"

"No, Vere."

"How forgetful of him! But never mind!" She went up stairs, looking disappointed.

Hermione reread the letter. She wondered, perhaps more than Vere, why there was no message for the child. The child—she was still calling Vere that in her mind, even after the night conversation with Gaspare. Two or three times she reread that sentence, "I feel specially that this summer I should like to be near you," and considered it; but she finally put the letter away with a strong feeling that most of its meaning lay between the lines, and that she had not, perhaps, the power to interpret it.

Vere had said that Emilio was forgetful. He might be many things, but forgetful he was not. One of his most characteristic qualities was his exceptionally sharp consciousness of himself and of others. Hermione knew that he was incapable of writing to her and forgetting Vere while he was doing so.

She did not exactly know why, but the result upon her of this letter was a certain sense of depression, a slight and vague foreboding. And yet she was glad, she was even thankful, to know that her friend was going to spend the summer on the bay. She blamed herself for her melancholy, telling herself that there was nothing in the words of Artola to make her sad. Yet she continued to feel sad, to feel as if some grievous change were at hand, as if she had returned to the island to confront some untoward fate. It was very absurd of her. She told herself that.

The excursion to Capri had been a cheerful one. She had enjoyed it, and all the time she had been watching Vere, and seeing her, as she had not watched and studied her before. Something had suddenly made her feel unaccustomed to Vere. It might be

(Continued on page 28.)

A SPIRIT IN PRISON

(Continued from page 26.)

the words of Gaspare, the expression in the round eyes of the Marchesino, or something new, or newly apparent in Vere. She did not know, but she did know that now the inclusion of Artés in mention Vere in his letter seemed to add to the novelty of the child for her.

That seemed strange, yet it was a fact. How absolutely mysterious are many of the currents in our being. Hermione thought. They flow far off in subterranean channels, unseen by us, and scarcely ever realized, but governing, carrying our lives along upon their deeps towards the appointed end.

Gaspare saw that his presence was not quite as usual, and looked at her with larger-eyed inquiry, but did not at first say anything. After tea, however, when Hermione was sitting alone in the little garden with a book, he said to her bluntly:

"Che ha lei?"

Hermione put the book down in her lap.

"That is just what I don't know, Gaspare."

"Perhaps you are not well."

"But I believe I am, perfectly well. You know I am always well. I never even have fever. And you have that sometimes."

He continued to look at her searchingly.

"You have something."

He said it freely, almost as if he were supplying her with information which she needed and had lacked.

Hermione made a sound that was like a little laugh, behind which there was no mirth.

"I don't know what it is."

Then, after a pause, she asked that phrase which is so often upon Sicilian lips:

"Ma forse è il destino."

Gaspare moved his head once as if in acquiescence.

"When we are young, signora," he said, "we do what we want, but we have to wait it. And we think we are very free. And when we are old we don't feel to want anything, but we have to do things just the same. Signora, we are not free. It is all destiny."

And again he moved his head solemnly, making his liquid brown eyes look more earnest than usual.

"It is all destiny," Hermione repeated, almost dreamily.

Just then she felt that it was as if each human being, and she most of all, was in the grasp of an inflexible, of an almost fierce guide, who chose the paths, and turned the feet of each traveller, reluctant or not, into the path the will of the guide had selected. And now, still dreamily, she wondered whether she would ever try to rebel, if the path selected for her were one that she hated, or feared, one that led into any horror of darkness or any horror of too great light. For light, too, can be terrible, a sudden great light that shines pitilessly upon one's own soul. She was of those who possess force and impulse, and she knew it. She knew, too, that these are often rebellions. Just today it seemed to her that she might believe so much in destiny, that she might believe in the inflexible purpose and power of the guide, that her intellect might forbid her to rebel, because of rebellion's beclouded utility. Nevertheless, she supposed that it was her instinct to rebel, she would do so at the psychological moment, even against the dictates of her intellect.

Gaspare remained beside her quietly. He often stood near her after they had been talking together, and calmly shared the silence with her. She liked that. It gave her an impression of his perfect confidence in her, his perfect ease in her company.

"Don't you ever think that you can put a knife into Destiny, Gaspare?" she asked him, presently, using an image he would be likely to understand, "as you might put a knife into a man who tried to force you to do something you didn't wish to do?"

"Signora, what would be the use? The knife is no good against Destiny, nor the revolver, either. And I have the permission to carry one," he added, with a smile, as if he realized that he was being whimsical.

"Well, then, we must just hope that Destiny will be very kind to us, be a friend to us, a true comrade. I shall hope that, and so must you."

"Ri, signora."

He realized that the conversation was finished and went quietly away.

Hermione kept the letter of Artés. When he came back to the bay she wanted to show it to him, to ask him to read for her the meaning between its lines. She put it away in her writing table drawer, and then resolved to forget the peculiar and this agreeable effect it had made upon her.

A fortnight passed away before Artés's return. June came in upon the bay, bringing with it a more vivid life in the environs of Naples. As the heat of the sun increased, the vitality of the human notes that danced in its beams seemed to increase also, to become more distant, more persistent. The wild wanderer was in flower. The thorny cactus put forth upon the rim of its precipitous pale yellow blossoms to rival the red exclamation that thronged about it impetuously in Italy. In the streets of the city ranged boys ran in crying, "Frische!" and holding aloft the shallow baskets in which the rosy fruit made splashes of happy color. The carters wore bright carnations above their dusty ears. The children exposed their bare limbs to the sun, and were proud when they were given morsels of ice wrapped up in vine leaves to suck in the intervals of their endless dances and their play. On the hill of Posillipo the Vesuvius blinks of the houses, in the gardens enclosed by the rounded skirts of the great stone pines, were thrust back, the windows were thrown open, the glad sun rays fell upon the cool paved floors, over which few feet had trod

den since the last summer died. Loud was the call of "Acqua!" along the roads where there were buildings, and all the lemons of Italy seemed to be set forth in baskets to please the eyes with their sharp, yet soothing, color, and tempt the lips with their poignant juice. Already in the Galleria an "avviso" was prominently displayed, advising that Ferdinando Rivero, the famous maker of Sicilian ice-creams, had returned from Palermo for the season. In the Piazza del Plebiscito hundreds of chairs were ranged before the band stand, and before the kiosks where the women sit on the night of summer near the Caffè Turco. The "Margherita" was smiling up. The "Eborato" was opening. And all along the sea, from the variable heights protected by the brushwood borders on the outskirts of the city towards Portici, to the balconies of the "Mascotto," under the hill of Posillipo, the wooden bathing establishments were creeping out into the shallow waters, and displaying proudly to the passer-by above their names: "Stabilimento Ebraico," "Stabilimento Donna Anna," "Stabilimento delle Sirene," "Il Piccolo Paradiso."

And all along the sea by night there was music.

From the Piazza before the Palace the band of the Caffè Gambirini sent forth its busy valves. The peering women of the wooden kiosks caught up the strain of sound, and sang it on with their shrill voices down the hill towards Santa Lucia, where, by the water-side and the crowding white yachts, the itinerant musicians took it into the keeping of their guitars, their mandolins, their sprightly fiddles, and their loud and tremulous voices. The "Valse Blau," "Santa Lucia," "Addio mia bella Napoli," "La Frangosa," "Sole Mio," "Marchesino," "Pierdiana," "La Cicalina," with the chain of light the chain of light of the music round the bay: from the Eborato, past the Hotel de Vesuvio, the Hotel Royal, the Victoria, to the tree-shaded alleys of the Villa Nazionale, to the Margellina, where the naked mermaids of the flower folk took their evening bath among the resting boats, to the "Seggio di Frisco," and upward to the Ristورانте della Stella, and down to the Ristورانте del Mare, and so away to the point, to the Antico Ginepro.

Long and brilliant was the chain of lamps, and long and ardent was the chain of melodies melting one into the other, and stretching to the wide darkness of the night and in the great stillness of the sea. The night was alive with music, quivered with the quivering mandolins, palpitated with the voices that beat like hearts overcharged with sentimental longings.

But at the point where stood the Antico Ginepro the lights and the songs died out. And beyond there was the mystery, the stillness of the sea.

And there, beyond the chain of lights, the chain of melodies, the light lay in its delicate isolation; nevertheless, it too, was surely not unaware of the coming of summer. For even here Nature ran up her flag to honor her new festival. High up above the rock on the mainland opposite there was a golden glory of ginepro, the brown plant, an expanse of gold as brilliant, so dense in its low surroundings, that Vere said, when she saw it:

"There is something ever even in beauty, madre. Do you like successful audacity?"

"I think I used to when I was your age," said Hermione. "Anything audacious was attractive to me then. But now I sometimes see through it too easily, and want something quieter and a little more mysterious."

"The difference between the Marchesino and Monsieur Emile" said the girl, with a little laugh.

Hermione laughed too.

"Do you think Monsieur Emile mysterious?" she asked.

"Yes—certainly. Don't you?"

"I have known him so intimately for so many years."

"Well, but that does not change him. Does it?"

"No. But it may make him appear very differently to me from the way in which he shows himself to others."

"I think if I knew Monsieur Emile for centuries I should always wonder about him."

"What is it in Emile that makes you wonder?" asked her mother, with a real curiosity.

"The same thing that makes me wonder when I look at a sleepy lion."

"You call Emile sleepy?" said Hermione.

"Oh, and his intellect, madre! Of course that is horribly, hideously wide awake."

And Vere ran off to her room, or the garden, or the Saint's Pool—who knows where?—leaving her mother to say to herself, as she had already said to herself in these last days of the growing summer, when Alena I said that to Emile, what a fool I was? She was thinking of her statement that there was nothing in her child that was hidden from her. As if in answer to that statement, Vere was unconsciously showing to her day by day the folly of it. Emile had said nothing. Hermione remembered that, and realized that his silence had been caused by his disagreement. But why had he not told her she was mistaken? Perhaps because she had put him down having been in his old path that was in her heart. Her call had been for sympathy, not merely for truth. She wondered whether she was a coward. Since they had returned from Capri the season and Vere had surely changed. Then, and always afterwards, Hermione thought of those three days in Capri as a definite hiatus, a dividing line between two periods. Already, while in Capri, she had begun to watch her child in a new way. But that was, perhaps, because of an unconscious, partly nervous, within her self. In Capri she might have been imagining. Now she was not imagining, she was truthfully.

Over the sea came in the belt the intensity of summer. Then (Continued on page 36.)

Pink Lemonade and Philosophy

(Continued from page 17.)

sent up Mike, him bein' little and skinny, to guide the riggin' into place. There's gangs settin' up stuff all over the place, and there's enough guy lines stretched to make that end of the tent look like a big barn.

Then Dugan has his lucky slip. He pitches off the top of the pole, and most of the boys begin to figure how long it will take to gather up the remains. But that's not what Dugan drops about a foot and starts a good deal of singing like a brass-bell string. He bounces off and makes the prettiest turn you ever saw before he hits another line about eight feet opposite and some further down. Consequently, he is the first manœuvre with superior variations, and the other line still further down. He hits five lines altogether, bounding down on the zig-zag step plan, and then, seen't there's a line to be made. He finishes the trip as nature intended.

"Jenkins, the Manager, is dancin' up and down like a crazy man."

"'Finest ever!' he yells. 'Got the loop-the-loop skun a mile. There's a fortune if I can get it done regular.'

"Dugan has come to and is sittin' up
clined. Jenkins turns to him.

"I'll give you two hundred a week if you pull it," says he, "providin' I ain't held re-

"'I'll take you,' says Dugan, 'if you let me practice with nets and wear pads where the lines hit.' He kept at it for a week, and now he's the feature of the show."

"Marvellous!" said the Student. "But why does he pose as a woman?"

"Well, because it's more romantic and exciting, and then the heavy upholstery necessary in certain spots to give him the female form divine keeps the lines from cutting him in half."

"I suppose a great many become circus performers through accident?" hazarded the Student, hopefully.

"Yes," said the Pink Lemonade Man emphatically: "it *is* the mostly understated accidents. Don't ask me what I think of 'em an' rouse my feelings 'em a night like this. I'll say this much, though: that for swayed heads and 'comin' it ever you' business, about all of 'em's got open stars inlaid in the centre pole. Of course it ain't the real performers, which some of 'em circus families, that put on airs. It's these kid-glove specimens that in the winter work in polite vaudeville.

"An' what good are they, anyhow, except to depe out stunts that look hard, but is dead easy? They got to have private cars and stop in swell boarding houses, and if you introduced them to a horse they'd have to use smellin' salts. It ain't like the good old days when all hands lived and eat in the tents, and hardluck riders an' tight-rope walkers wasn't about helpin' out up the canvas, or at least poodin' the time of day."

"You can trace the decadence?" encouraged the Student.

The Pink Lemonade Man looked deeply puzzled for a moment. Then his face brightened.

"Oh, so far as that goes," he said, blandly, "nowadays the managers insist on plenty of soap and water."

Before we had time to solve the meaning of the mysterious reply there was a trumpet blast followed by the outburst of a band. The Triumphant Pageant of the Nations was emerging from the dressing tent.

"You'll have to excuse me," said the Pink Lemonade Man apologetically. "After the parade kicks up the dust, my boys 'll be kept busy peddlin' our gangle. Stop back later."

PEOPLE who know what a good cocktail really is have given up the idea of mixing their own drinks, and keep a bottle of CLUB COCKTAILS always on hand. CLUB COCKTAILS relieve you of all the fuss and trouble of preparation. They are always ready for use; and a *measure-mixed* CLUB COCKTAIL makes a vastly better drink than any made-by-guesswork drink could ever be. Try a bottle.

Seven kinds. At all good dealers. Manhattan, (whiskey base) and Martini (gin base) are universal favorites.

(Continued from page 28.)

world was changing. And in this changing world Vere was beginning to show forth more clearly than before her movement onward—whither?

As yet the girl herself was unconscious of her mother's new waterfulness. She was happy in the coming of summer, and in her happiness was quite at ease, like a kitten that stretches itself luxuriously in the sun. To Vere the world never seemed quite awake till summer came, only in the hot sunshine did there glow the truthfulness and the fulness of life. She shared it with the ginestra. She saw and felt a certain cruelty in the gold, but she did not fear or condemn it, or wish it away. For she was very young, and though she spoke of cruelty she did not really understand it. In it there was force, and force already appealed to the girl as few things did. As, long ago, her father had gloried in the coming of summer to the south, she gloried in it now. She looked across the Pool of the Paint to the flood of yellow that was like sunlight given a body upon the cliff opposite, and her soul revelled within her, and her heart rose up and danced, alone, and yet as if in a glad company of dancers, all of whom were friends. Her brain, too, sprang to the alert. The sun increased the feeling of intelligence within her.

And then she thought of her room, of the hours passed shut in there, and she was torn by opposing impulses.

But she told no one of them. Vere could keep her secrets, although she was a girl.

How the sea welcomed the summer! To reach this house on the island would have seemed an arid, inhospitable place, desolate and lost amid a cruel world of cliffs and waters. It was not so to Vere. For she entered into the life of the sea. She knew all its phases, as one may know all the moods of a person loved. She knew when she would find it stormy calm, at early morning and when the evening approached. At a certain hour, with a curious regularity, the breeze came, generally from Ischia, and turned it to vivacity. A temper that was almost frivolous then possessed it, and it broke into gayeties like a child's. The waves were small, but they were impetuously lively. They made a turmoil such as archers make at play. Mindless of reverence, but not consciously impious, they flung themselves at the feet of San Francesco, casting up a tiny tribute of spray into the air.

Then Vere thought that the saint looked down with pleasure at them, as a good old man looks at a crew of laughing children who have run against him in the street, remembering his own youth. For even the saints were young! And, after that, surely the waves were a little less boisterous. She thought she noted a greater calm. But perhaps it was only that the breeze was dying down as the afternoon wore on.

She often sat and wondered which she loved best—the calm that lay upon the sea at dawn, or the calm that was the prelude to the night. Silvery were these dawns of the summer days. Here and there the waters gleamed like the scales of some lovely fish. Mysterious lights, like those in the breast of the opal, shone in the breast of the sea, stirred, surely travelled as if endowed with life, then sank away to the far-off kingdoms that man may never look on. These dawns drew away the girl's soul as if she were led by angels, or, like Peter, walked upon the deep at some divine command. She felt that though her body was on the islet, the vital part of her, the real "I," was free in roam across the great expanse that lay flat and still and deliciously mysterious to the limits of eternity.

She had strange encounters there, the soul of her, as she went towards the east.

The evening calm was different. There was, Vere thought, less of heaven about it, but perhaps more of the wonder of this world. And this made her feel as if she had been nearer to heaven at her birth than she would be at her death. She knew nothing of the

defilements of life. Her purity of mind was very perfect; but, taking a parable from Nature, she applied it imaginatively to Man, and she saw him scoured with dust because of his journey through the world. Poor man!

And then she pitied herself too. But that passed. For if the sea at evening held most of the wonder of this world, it was worth the holding. Rarely would she substitute the heavenly mysteries for it. The fishermen's boats were dreams upon a dream. Each sail was akin to a miracle. A voice that called across the water from a distance brought tears to Vere's eyes when the breeze was at its fullest. For it seemed to mean all things that were tender, all things that were wistful, all things that trembled with hope—that trembled with love.

With summer Vere could give herself up to the sea, and no only imaginatively, but by a bodily act.

Every day, and sometimes twice a day, she put on her bathing dress in the Casa del Mare, threw a thin cloak over her, and ran down to the edge of the sea, where Gaspare was waiting with the boat. Hermione did not bathe. It did not suit her now. And Gaspare was Vere's inseparable companion. He had superintended her bathing when she was little. He had taught her to swim. And with no one else would he ever trust his padroncina when she gave herself to the sea. Sometimes he would row her out in a reel of racks in the open water not many yards from the island, and she would dive from them. Sometimes, if it was very hot, he would take her to the Grotto of Virgil. Sometimes they would row out to sea, and then, like her father in the lagoon sea before the Casa delle Sirene, Vere would swim away and imagine that this was her mode of travel, that she was journeying alone to some distant land, or that she had been by the sea forever.

But very soon she would be sure to hear the soft splash of one following her, and, looking back, would see the large, attentive eyes of the faithful Gaspare cautiously watching her dark head. Then she would lift up one hand, and call to him to go, and so she did not want him, that she wished to be alone, smiling and yet imperious. He only followed quietly and inflexibly. She would dive. She would swim under water. She would swim her fastest, as if truly anxious to escape him. It was a game between them now. But always he was there, latent upon her safety.

Vere did not know the memories within Gaspare that made him such a guardian to the child of the padrone he had loved; but she loved him severely for his watchfulness, even though now and then she longed to be quite alone with the sea. And this she never was when bathing, for Hermione had exacted a promise from her never to go to bathe without Gaspare. In former days Vere had none or twice begun to protest against this prohibition, but something in her mother's eyes had stopped her. And she had remembered.

"Father was drowned in the sea."

Then, understanding something of what was in her mother's heart, she threw eager arms about her and anxiously promised to be good.

One afternoon of the summer, towards the middle of June, she prolonged her bath in the Grotto of Virgil until Gaspare used his authority and insisted on her coming out of the water.

"One minute more, Gaspare! Only another minute!"

"Ma signorina!"

She died. She came up.

"Ma veramente signorina!"

She died again.

Gaspare waited. He was standing up in the boat with the oars in his hands, ready to make a dash at his padroncina directly she reappeared, but she was wily, and came up behind the boat with a shrill cry that startled him.

To be Continued.

A SPRING POEM

By GEORGE JAY

The horses chirping cock their heads,
The summer sausage sprouts,
The little pigs in garden beds
Push up their tender snouts.

The turning worm has left the soil,
Estate hop-vines leap,
The butcher stifens up his bill,
The chicken tests its crop!

The pussy cats from willow trees
Are sprawling on the ground,
And in the field the new-born chicks
A-kipping go, all round.

The butterflies with latter fill,
The bees waxed big on sizzling,
The redstart about is never still,
The woolly tramps are gumbeling.

The turtle's voice is heard once more
As creeps he over the land,
The tame grass runs up to the door,
The fly feeds from your hand.

The cow is waddling from her nest
In elm no longer bare,
Then skimming with creamy crest
The cowbirds through the air.

Soon will the corn prick up its ear,
The arrowroot will shoot,
The trees their dizzy heads will rear
Yet keep their feet, to boot.

Oh, some will freeze in winter-lime,
Oh summer some are slain,
With half some fall in love, but I'm
Glad spring's unmoved again!

From stereograph engraving, sent, by Underwood & Underwood

UNITED STATES SENATOR WHYTE, who died recently in Baltimore at the age of eighty-six years, had a long public career. He was born in Baltimore, and elected to the State Legislature at the age of twenty-three, becoming afterwards Controller of Currency for Maryland, and Governor of his State. In 1880 he became Mayor of Baltimore. He was appointed to the United States Senate in 1888 to fill the unexpired term of Beverly Johnson, was re-elected in 1874, and was again appointed in 1906 to fill the vacancy caused by the death of Arthur Pue Gorman. Senator Whyte was one of the few Democrats who defended President Johnson during the impeachment proceedings.

THE National Congress of Mothers held their annual meeting last month at Washington, D. C., and in the course of their sessions elected Mrs. Frederic Schoff as president. The members of the executive committee, as shown in the photograph, are as follows:

First row, left to right: Mrs. David M. Sears, of Albany, New York; first vice-president: Mrs. Frederic Schoff, of Philadelphia, Pennsylvania; president: Mrs. Robert H. Cotton, of Hurry, North Carolina. Back row, left to right: Mrs. James F. Holton, of New Haven, Connecticut; Mrs. Herman H. Birney, of Philadelphia, Pennsylvania; Mrs. Mary K. Garrett, of Philadelphia, Pennsylvania; Mrs. Louise K. Gilson, of Wilmette, Illinois, treasurer.

GERMANY'S "AGENTS OF PROSPERITY"

It has been said that Prussia's triumph in the Franco-German war was due to the schoolmaster; and it may be said with equal reason that Germany's commercial prosperity is due to him, because he drills the future "drummer" for his work.

The chief agent in the expansion of German trade is the "drummer." He follows up his ideas from their conception till they have achieved successful issue; he never lets go. No other European nation shows this tenacity of purpose.

But, as already remarked, the "drummer" is the product of the schoolmaster. In the school of commerce the future representative of the nation's trade gets a special education. He is taught to speak fluently whatever language he may need for the purpose of drumming up custom. He studies the art of making himself agreeable, of analyzing the peculiarities of his customers, of training himself to a philosophical and superb complacency when confronted with the prejudices of foreign purchasers. In England or in France any man may be a drummer; the good customer is the man who can sell large bills of goods to people who do not need anything that he carries. He works on salary and commission, and he is bound to sell; his value to his employers depends upon it, and so does his personal comfort.

That is all very well in France, England, or America, but the drummer of Germany has to be something quite different. He must come from either the upper ranks of life, or be so habituated to good society that a cultured bearing has become his second nature. He must be gentle under all circumstances, polite, and anxious to satisfy every whim of his customer.

Pleasing personality is the first qualification of the German "on the road." He is not magnetic; his methods exclude everything along the line of hypnotic suggestion. He puts aside his own wishes, and waits for an expression of the wishes of his little world. He is obsequious, and his enterprise produces permanent trade relationships—not the trade of a month or of a year. He is an explorer; he does not go south in winter and north in summer; he does not take the road travelled by the man of wealth. He

breaks ground in unknown fields; he endures hardship; he fells his way through forests, to get into new countries and to represent his house where no other house has been heard of. He aims to be the first of his kind, and for that reason the German drummer is known in the backwoods of nearly every country under the sun. All Europe knows him; he is known in Scandinavia, Russia, Portugal—everywhere where German goods can find a market. Wherever there is trade, Germany has a dozen representatives to France's, England's, or America's one, and generally speaking the Germans have the best of it, because they are tactful, yielding, patient, and agreeable.

The German knows how to fulfill the demands of his customers. His "free samples" are not like any other free samples known. They are large enough to give an idea of what they represent. He offers exceptional facilities to buyers, not only by giving credit, but in a hundred different ways. He never urges people to purchase. If one sample does not please, he withdraws it and offers another. For instance, he carries samples of cloth of different widths; if some of his widths is satisfactory he takes an order for the widths desired, the German weaver furnishes it, and the drummer delivers it woven to order. He promises to the full extent of his employer's power of execution, and he is justified in doing so, because his house supports him and carries out all his promises.

As he furnishes cloth of any width desired, so he takes orders for and delivers such odd and modified forms of machinery as are suggested by his customers by the modest samples that he carries. "No," he says, with a tender light in his eyes, while he curls his light mustache—"no, we have not manufactured that shape as yet, but we can manufacture it." And he takes the order.

"Of what importance is a trifling thing like that?" somebody asks him.

"Suppose we haven't got it! We can make it! The main thing is to give them what they want!" he answers. That is his key note. He is not to please. His object is to make an outlet for the material goods of German industry that pour in constantly increasing volume from thousands of factories.

The Camel and the Needle's Eye

GIUSEPPE CARATO stored himself away in the hold of the *Merle* at Palermo in order to reach this country. He was discovered during the voyage, and when the ship reached New York was locked in the hospital. Through the perils of Giuseppe could see the haven of his dreams, and the sight proved so alluring that he forgot the proverb of the

A Stowaway's Flight which ended half way through a Ship's Porthole

camel and the needle's eye and tried to crawl out to freedom. Giuseppe became wedged when half way through, and it was necessary to cut away his clothing and lubricate him with oil before he could be released. The process was accompanied by a spanking. Now Giuseppe is outward bound for Palermo.

The Passing of the French

The population of France, whose thirty millions formed the most numerous national non-English group in Europe at the opening of the last century, has increased only twenty-six per cent. during the past hundred years, as against England's 350 per cent., and America's 1600 per cent.

The total population of France is now 38,336,788. The female sex exceeds the male in number, the figures being, respectively, 19,323,809 and 19,012,979. On the other hand, an excess in the number of the unmarried is shown on the masculine side, the respective figures being 9,917,176 and 9,114,536. There are 2,751,897 widows and divorced women, as against 1,005,884 widowers and divorced men.

The number of French families is 9,761,117, of which 1,214,773 are without children; 2,249,337 have but one child; 2,010,063 have two; 1,210,264 have three; 748,841 have four; 429,719 have five; 248,159 have six; 138,719 have seven; 71,841 have eight; and 33,917 have nine children. These figures continue to represent, in a rapidly decreasing proportion, the number of families having a larger number of children. Upon comparing these groups of figures, it will be perceived that for about two thirds of the families of France the average number of children does not exceed three; while for about one and one half per cent. of them the average number is seven; and for less than one per cent. of the same, eight children. Twenty-four families are recorded, however, as possessing seventeen, and 34 as possessing eighteen children.

The Northwest Under Three Flags

By CHARLES MOORE

With Illustrations by Howard Pyle, Fred-
eric Remington, and others, Maps, etc.

The early story of the Northwest—the French ex-
plorations and occupation, the Indian wars, the Eng-
lish conquest and later assumption by the United
States.

In the preparation of this account of the pioneers
of civilization, the author has had access to the famous
Parksman Collection of MSS and government sources.

The work is of historical importance, correcting
a number of errors and misapprehensions sanctioned by
previous writers, and is written in an engaging
style.

THE PRINCIPLES OF MONEY AND BANKING

By CHARLES A. CONANT

In the demand for literature on financial subjects, this work deserves special consideration. A chapter of the second volume is specially devoted to "The Origins of Crises," in which much is set forth that anticipates present conditions. Another chapter, on "The Management of Crises," anticipates the recent steps taken by the banks and the Treasury to afford relief to the money market.

This book was among the first to point out the danger of making large loans on securities pushed upward by speculation to inflated values.

STORIES OF SYMPHONIC MUSIC

A Guide to Modern Orchestral Programme-Music

By LAWRENCE GILMAN

Music Critic of "Harper's Weekly"

This book fills a genuine need of the music-lover, for it offers in compact, accessible, and easily intelligible form information which will help him to listen understandingly to the music of an orchestral concert. It presents clearly and without technical analysis the poetic or pictorial or dramatic basis of every important example of programme-music in the symphonic repertoire, putting the reader in possession of information which will enable him to listen comprehendingly, for example, to a symphony by Berlioz, an overture by Mendelssohn, a symphonic poem by Liszt, or a tone-poem by Strauss or Debussy.

"The best thing for every concert-goer to do is to get a copy of Mr. Gilman's book and prepare himself beforehand."—N. Y. Evening Post.

"From Beethoven and Liszt and Wagner, down to the latest works of Stravinsky, Debussy, Sibelius, Rimsky-Korsakoff, Elgar, Chabrier, and Copland, with many others that will occur to concert-goers, Mr. Gilman has left nothing that has any claim to the attention of music-lovers. . . . It is a useful and interesting book."—The New Music Review.

"A valuable contribution to the music-lover's library."

Price, \$1.25 net.

The Nile.—None of the great rivers of the world is perhaps to be compared with the Nile in the wonders of the present-day country through which it flows and in the myriad romantic associations of its storied past. Miss MARIE VAN VOEST, who recently visited Egypt for HARPER'S MAGAZINE, writes most vividly of the river of to-day and of the past, and Andre Castaigne, who also went to Egypt for the MAGAZINE, has made a most remarkable group of pictures to illustrate the article.

Edwin A. Abbey's Shakespeare Pictures.—EDWIN A. ABBEY, R.A. (whose illustrative work appears only in HARPER'S), has made some of his most exquisite pictures to illustrate Shakespeare's "Timon of Athens." They are accompanied by a charming critical essay on the play by William Sharp.

The Story of a Famous Street.—This is the second article in FREDERICK TAYLOR HILL'S notable series, in which he tells the story of Wall Street, from its earliest beginnings under the Dutch. Mr. HILL writes some little-known chapters in the history of Wall Street in pre-revolutionary days under the British.

The Modern Alchemy.—Has the dream of the old-time alchemists proved true? Can one element be produced from another. The great scientists of England have achieved remarkable results in their experiments in this direction. Professor ROBERT KENNEDY DUNSTON, of the University of Kansas, writes most clearly and comprehensively of what they have accomplished. A narrative more fascinating than any romance.

Through London by Water.—Many visitors in London have caught a casual glimpse, at one point or another, of an old canal still in use. Few know, however, that this same canal traverses almost the entire city from one end to the other, and that from it branch off other canals by which the traveller might go by water to almost any point in England. SIDNEY BAGGOTT writes interestingly of life along this old canal, and Vernon Howe Bailey has made a large number of pictures illustrating its course.

A Heroic Princess.—Among the heroic deeds of brave women of history, none is more worthy of admiration than the remarkable attempt of the Duchesse de Berry, the daughter-in-law of Charles X., to establish her little son, the Duke of Chambord, in his rightful place as King of France. The story of the daring adventures of this royal princess, who journeyed for weeks alone in disguise through hostile country, and the dramatic episode of her capture are vividly pictured by BASIL KING in the May HARPER'S.

The Burden of the Caucasus.—H. W. NEVINS gives a remarkable picture of the drama and tragedy of life among the rebelling people of the Caucasus. A revelation of conditions of which little has reached the outer world.

Mrs. Humphry Ward's Great Serial, "The Testing of Diana Mallory"

COMMENT

Dr. Wilson at the Jefferson Dinner

MR. BRYAN was not invited to speak at the JEFFERSON birthday dinner of the National Democratic Club in New York, and, properly enough, stayed away from the dinner altogether. He also politely vetoed the proposal to have a rival dinner here the same night at which he should be the chief speaker. If he had spoken here, he would have given an excellent oratorical entertainment, but sent his listeners away no wiser than they came. Not so did Dr. WOODROW WILSON, the chief speaker at the dinner which Mr. BRYAN did not attend. There was much meat in his remarks; meat fit for Democrats to digest and assimilate. He talked, not of conditions, but of principles, of which both parties seemed to him to be losing sight. Both parties, he said, have turned to the regulation of business, and he admitted that with the transfer of the greater part of the business of the country into the hands of great corporations and trusts there was undisputed need of "adjustments and reformulations of the law which the courts have not had the power or the courage to make, and which must therefore be made by legislation." Discussing what the characteristics of that legislation should be, he said:

We have, in fact, turned from legal regulation to Executive regulation. We have turned from law to personal power. It is that choice which as Democrats we challenge, and challenge with confidence, as opposed to every ancient principle of liberty and of just government.

A mere casual examination of recent legislation will show that these statements are not based upon fancy or upon exaggeration, but upon the necessary character of the things we have been trying to do.

The latest proposals are typical of all the rest. All combinations or agreements in restraint of trade had been forbidden by statute, but some agreements in restraint of trade, some sorts of pooling of rates by the railroads, for instance, do not in fact operate to the detriment of the public or of trade itself, but are beneficial rather, and to be desired in the interest alike of efficiency and economy. The lawmakers, upon that discovery, are not loath to let the reformers to attempt definitions of law which will discriminate between those agreements in restraint of trade which are innocent of monopolistic intent or effect and desirable in the interest of the community itself and those which the vulgar original law was intended to prevent. They are urged, on the contrary, to put the whole matter in the hands of an executive officer. It is proposed to invite all corporations which wish to keep within the limits of the law to register with him and to submit all their contracts and arrangements to him for his sanction or disapproval; to let him make law by executive order.

If this is necessary, government by law has broken down and personal government has been substituted. I for one do not believe that it is necessary. Neither do I believe that the American people have consciously made any such choice. They have been lashed by reformers who acted upon no principle whatever into measures the real character and consequences of which were not explained to them. When these measures are introduced the people of this country will turn from them and substitute law once more for personal power.

To all thoughtful persons, scrupulous of the ancient principles

of our law, it is evident where this demoralization crept in. It is plain why the Federal government has become the patron of the people instead of the arbiter of just and definite law. Our later tariff legislation has not been based upon the general welfare, but upon the patronage of special interests already strong, already very influential in politics. The present tariff is really a mass of special favors.

The corporation lawyers of this country know what is going on; the legislators do not. I want to say to all corporation lawyers, "If you would save the corporation, you will come out from cover and tell the legislators what is needed. You know what is needed; they don't. If they tell them you will save the corporation. If you don't, you will have the mob at its doors in a decade."

Two Men of an Excellent Spirit

Closing his address, Dr. WILSON said:

I find a great many men who do not know which party they belong to, because they cannot see any difference between them. This country is waiting for a party which will be brave enough to abide the slow processes of success and to say that they know that righteousness, that right judgment, that careful adjustments of law, that the slow processes of courts are the bases of human liberty; and that it will not despair of human liberty until it has itself departed from these historic and ancient bases.

It is interesting and encouraging to find Governor JOHNSON of Minnesota saying, the same evening, in his JEFFERSON day address at Louisville:

Expediency never got a nation anything; it never got a people anything; it never will get the Democratic party anything. When the Democratic party in its national convention plants its cause on the grounds of expediency and adopts a platform based on expediency, it cannot win and ought not to win.

What we want today is to go before the people with a patriotic, manly declaration and ask for the concurrence of the people in that declaration.

I know it may be a long road to the victory which we all want to see come. If we have the patience to endure, if we have the faith that ought to be in us, and if we have the intrepidity which ought to be characteristic of a Democrat, we shall get there.

WILSON and JOHNSON may not be perfectly at one in the details of their opinions, but there is a notable identity of spirit in their words as we have quoted them. If the Democratic party can tie to such leaders as they are, we see no reason why the road to victory should be a long one, or why the processes of success should be slow.

New York and Massachusetts Republicans

The long struggle in Massachusetts between LOUG and CRANE and the sentiments which the two Senators respectively represented ended as it should have done in an agreement to send an unimpaired delegation to the Chicago convention. The TURTLE sentiment, fostered by Senator LOUG, was strong, but not strong enough to control the convention or beat the inclination towards KNOX, led by Senator CRANE. In New York the Republican convention endorsed with pride "the great administration of President ROOSEVELT," and directed the delegates whom it chose to present at Chicago the name of Governor HUGHES, and to use all honorable means to bring about his nomination. All the same, New York will send a delegation much divided in sentiment. Governor HUGHES's chances for first place do not look promising, though he would be an attractive candidate for Vice-President.

Four Battleships or Two

It will be recalled that some four months ago Secretary of the Navy MCMURDO requested Congress to authorize the laying down of four first-class battleships during the current year. The request was referred to the Naval Committee of the House, a majority of which reported the other day in favor of beginning the construction of only two battleships. The majority report has laid itself open to criticism, because the accompanying account of the relative naval strength of various Powers was noticeably defective. For example, it did not take cognizance of the fact that Germany's construction plan, which originally had provided for only three battleships of the *Breadthought* type a year, has recently been revised with the consent of both the Reichstag and the Bundesrath, so that the number of first-class battleships to be begun annually up to and including 1911 is to be increased to four. Moreover, the scheme provides for a certain number of armored cruisers of the *Invincible* type, one of which was launched the other day, and promises to be a most formidable engine of war. It is of 12,000 tons burden, is expected to cost nearly \$7,000,000. So too, the failure at The Hague to bring about a conventional reduction of expenditures for war purposes on land and sea was quickly followed by intensive activity in the shipyard

of France and of Japan. We cannot, therefore, afford to neglect the laying down of the keels of four battleships this year on the plea that we can do so hereafter should such an addition to our sea power seem necessary. President ROOSEVELT has announced himself warmly in favor of Secretary METCALF's original project.

Negro Votes Wanted in Georgia

CONGRESSMAN LIVINGSTON, of the Fifth Georgia District, who wants to be re-nominated, advises his supporters to vote next fall against the constitutional amendment which is aimed to disfranchise the Georgia negroes. The Democrats will need the negro votes, he says, to beat TOM WATSON and the Populists. "With the negro disfranchised," says LIVINGSTON, "WATSON would dominate the State." Here is a symptom of a change that would make an enormous difference about the negro vote in the South. With two white-man parties competing in close elections there would be very much less said and done about disfranchising the negroes.

Panama, Colombia, and the United States

It was reasonable enough that Panama should have considered it the duty of the United States to prevent the seizure of Juncalo by Colombia. The first article of the Canal Treaty of 1903 reads:

The United States guarantees and will maintain the independence of the Republic of Panama.

Panama promised that the town was hers, and that therefore we were pledged to preserve its independence. But are Juncalo Panama's? Our government appears to have thought a negative answer to this question quite possible, and to have understood, moreover, that Colombia, in seizing the place, was not so much asserting a right of permanent possession as endeavoring to induce Panama to settle diplomatically the boundary dispute between the two countries. There is no doubt that the Colombia of to-day under REYES is esteemed more highly at Washington than was ever yesterday's Colombia under MONCAYOS. In 1904, in Chicago, this gentleman was characterized by Mr. ROOR as an "irresponsible dictator." But two years later, at Cartagena, the Secretary of State referred to General REYES as "that noble and great man whom it is the privilege of Colombia to call her President." To be sure these words were spoken on Colombian soil, in the presence of Señor VASQUEZ-CORO, the Colombian Minister for Foreign Affairs; but if such circumstances suggest hyperbole they also evidence indisputably our government's change of front. However, to return to Panama. Only a few days before Mr. ROOR spoke at Cartagena he addressed, in the name of the United States, the National Assembly of the Isthmian republic. On this occasion he said among other things:

It often happens that we misunderstand each other. . . . Let us remember this in all our intercourse. . . . That independence which we, first among the nations of the earth, recognized, it is our desire to have maintained inviolate. Refuse this: be patient with us, as we will be patient with you.

Pretty good advice for the Panamanians to revell at such a time as this, when they are disposed, perhaps, to judge the conduct of the United States rather inconsiderately.

A Lease and a Peace Treaty

In 1896 the Russo-Chinese Bank negotiated in behalf of the Chinese Eastern Railway Company, a Russian corporation, a lease with the Chinese government. The lease granted to the company for a term of years a strip of land about thirty miles wide running through Manchuria, on which the company might operate its railway, and also, according to Baron ROOR, exercise an "absolute and exclusive right of administration." On this leased land stands a part of the town of Harbin, whereof the residents, both Chinese and foreign, have been subjected to governmental regulation by the director of the Chinese Eastern Railway. Against some such regulation, we gather from the papers, Mr. FREDERICK D. FOSTER, our consul at Harbin, appears to have protested. The question seems to be whether what is nominally a private foreign corporation can exercise governmental control over the inhabitants of leased land without infringing upon domestic sovereignty. In Article III, Section 2, of the Treaty of Portsmouth, Russia declared she had "no territorial advantages or preferential or exclusive concessions in Manchuria of such a nature as to impair the

sovereignty of China." It is difficult to reconcile with this declaration a concession which turns over, as Baron ROOR interprets, an "absolute and exclusive right of administration" over a part of China and its inhabitants to a Russian railway company substantially owned by the Russian government.

The New British Premier

MR. HERBERT H. ASQUITH, who has succeeded Sir H. J. CAMPBELL-BANNEMAN in the office of Prime Minister, was Home Secretary when the Liberals were last in power (1892-95), and since December, 1905, has been not only Chancellor of the Exchequer, but the principal champion of the measures of the Liberal government in the House of Commons. It is noteworthy that he should have attained the post of Premier at the age of fifty-five, in view of the fact that he is not a member of an influential family, and that he is the only lawyer who has reached the headship of the British government within about a century. PALMERSTON, GLADSTONE, and DISRAELI were each considerably older when called upon to form a cabinet. But though Mr. ASQUITH has broken precedents, none of his colleagues in the House of Commons disputes his fitness for the Premiership so far as intellectual qualifications are concerned. His possession of these he has abundantly demonstrated at the university, at the bar, in Parliamentary discussions, and in executive office. So far as the conjunction of mental ability and equipment with firmness of will and aptitude for debate is concerned, we suppose that all his fellow ministers, though they include such men as Mr. HALDANE, MR. JOHN MORLEY, SIR EDWARD GEE, and MR. LEYAL GEORGE, would concede to him pre-eminence. Does it follow that he is available? All of these qualifications were possessed by Sir ROBERT PEEL, under whom, nevertheless, occurred the memorable split in the Tory party which kept it out of office, except for two or three brief periods, during nearly thirty years. ASQUITH is by temperament of a non-compromising, masterful turn, although there never was a party in Great Britain more heterogeneous and in more urgent need of harmonization than is that which he is called upon to lead. Sir HERBY CAMPBELL-BANNEMAN was thought to have performed almost a miracle when by his kindly nature, judicious forbearance, timely reticence, and shrewd policy he succeeded in conciliating imperialists with pro-Boers, Anglicans with Non-conformists, within the Liberal ranks, and at the same time in persuading Laborites on the one hand, and Irish Nationalists on the other, to act as his auxiliaries.

His Policies

Mr. ASQUITH, like Lord ROSEBURY, avowed himself an imperialist during the South-African war, and, like Lord ROSEBURY, he is opposed to giving Ireland home rule until such a concession shall have been sanctioned by the predominant partner—that is to say, England proper. The mandate of a great majority of Irishmen, Scotchmen, and Welshmen he would not consider binding if not sanctioned by a majority of Englishmen. At heart he is an anti-socialist, and he never would have promised to introduce an old-age pension bill had he not felt constrained to yield to his official superior, who had premised to accede to the wishes of the Laborites in that particular during the campaign preceding the last general election. He is a believer in the maintenance of Britain's naval strength up to the "two-Power" standard, as was disclosed by the very lukewarm support he gave to Lord TRENCHARD's naval appropriations bill proposing to lay down only two *Dreadnoughts* during the current year. He is no enthusiastic advocate either of the education bill, the licensing bill, or the coal-miners' eight-hour bill, and it will surprise nobody if these three measures, which, between them, have dangerously weakened the Liberal party in the constituencies—as successive by-elections have proved—should during his Premiership be relegated to the background. What, then, is the issue which he can be trusted to keep at the front, and by means of which he will try to rally and consolidate the disjointed factions of the Liberal party? That issue undoubtedly will be free trade, and it is shrewdly chosen, for unquestionably a large fraction of the Unionists themselves remain free-traders, although under one disguise or another a majority of them have reverted to protection. It is possible that under ASQUITH's stalwart leadership and under the banner of free trade the Liberals

may recover much of the ground that they have lately lost, and gain another impressive victory at the next general election. Events have rendered it tolerably certain that they could not do it under any other flag.

The Reconstructed British Ministry

In the new cabinet the office of Chancellor of the Exchequer, which the Prime Minister relinquishes, becoming instead First Lord of the Treasury, will be filled by Mr. DAVID LLOYD GEORGE, lately president of the Board of Trade. Mr. JOHN MORLEY will remain Secretary for India (an office in which he has signally increased his high reputation), but, owing to ill health, has been made a peer, and goes to the House of Lords as Viscount MORLEY, thereby obtaining relief from his labors in the House of Commons. Mr. WENSTON CHURCHILL, lately Political Secretary of the Colonial Office, succeeds to the position of president of the Board of Trade, vacated by Mr. LLOYD GEORGE; Lord TUCKERMAN becomes President of the Council, leaving the office of First Lord of the Admiralty to Mr. HENRY MCKENNA, and the Earl of CREWE becomes Secretary for the Colonies, succeeding Lord ELLEN, who retires altogether from the cabinet. The changes are popular, and nearly all are commended as likely to strengthen Mr. ASQUITH'S hands.

Fuss

A great deal of fuss on one ground or another is found this spring with the young pretensions in the colleges. A Chicago dispatch says that the overmodest inhabitants of Wheaton (Illinois) are disgruntled and making trouble because the Wheaton College students held a nighttown parade to celebrate Wheaton's victory over Greenville in the oratorical contest. Gracious! Here in the athletics-rickia East any college would be far too pleased to have that much notice taken of us bratocratic contest to make any fuss about nightshirts.

Folks Who Don't Know What Is Wrong

There are many folks in this partially enlightened land who don't seem to know what is right, and a vast deal of pains is being taken to teach them. This great work of instruction is called reform. There seem to be also a lot more folks who don't know what is wrong, but think they do, and act with great vehemence upon their convictions. How are they going to be taught? It is important to teach them, because they lavish their strength, not in personal repentance, but in trying to hinder their neighbors from actions which they condemn. If a man (or a woman) thinks some act is wrong and doesn't do it, there is no great harm done, whether the act is really wrong or not. To be over-scrupulous about one's own conduct may be a mistake, but it is one for which the erring person chiefly suffers. But to be over-scrupulous about the conduct of other persons—to condemn their actions as wrong and get laws passed to make them illegal—does great harm if the actions condemned do not really deserve condemnation. The code of discipline of the Methodist Church, for example, when voluntarily accepted, may yield a great profit, spiritually and otherwise, to whosoever lives up to it; whereas to hold society in general up to the standard of the Book of Discipline under penalty of law, would work intolerable hardship. Something like that is what the folks who don't know what is wrong seem to be trying to do, and they are working out so many different actions, and in so many different lines—railroad regulation, night-riding, prohibition, anti-betting, anti-vice, anti-speculation, anti-corruption, anti-non-union labor, anti-cigarettes, and so on—that it makes the observer wonder where we are coming out. Blue laws have been tried, and have failed and always will fail. Reform legislation that rises higher than its source comes down again. But its source is the average conscience of the community. Individual virtue can rise far above that, and it will be a sad day for humankind when it doesn't. But law cannot, and should not. More attention should be given to the instruction of that part of our population who have exaggerated notions about what is wrong, and want their standards legalized. They are getting to be more dangerous and troublesome than the folks who don't know what is right. But it is hard to instruct them, for they are very prone to stop the paper if they don't agree with what is said.

The Fight Against Alcohol

CONTRADICTIONS abound in all discussions of alcohol and its effects. There is hardly one of us who has not suffered from the effects of drink on some one, and most of us, first or last, have suffered often and acutely from them. If alcohol has never been a snare to us as individuals, it has still been a grief and a burden to us in its effects on other persons who have been damaged by it, and whose burdens we may have had to carry. The feelings of that part of the population that hates "rum" with blind rage and impatience, and is ready to fight it at every turn and by any means that comes to hand, must be comparable to every experienced swimmer. From these halts of "rum" comes the energy that is the backbone of the fight for prohibition. Over against them are lined up, naturally enough, those who live by the manufacture and sale of alcoholic beverages: the brewers, distillers, wine growers, wine merchants, and saloonkeepers. The reformers are prone to tell us that alcohol is the root of all evil, and that if we could only get rid of it there would be no limit to our prosperity and happiness. Then we turn over some pages of history. We find in the North American Indians a fairly voluminous line of defects. They were cruel, superstitious, vindictive, and quarrelsome, improvident and unprogressive. Yet they were not only sober, but so exceptionally free from knowledge or use of alcohol that when they got hold of it they immediately showed a disposition to drink all they could get, with resulting disaster. So it is with most savages. They are delighted with the alcoholic beverages, but completely incompetent to make intelligent use of them. On the other hand, as we inquire into the past habits of the Scotch we find among them a strong addiction to three very powerful stimulants—religion, education, and whiskey. If any reasonable amount of drinking destroyed a people, it is hard to say where the Scots would be, but as it is, they are and have been for centuries one of the most noted and valuable groups in the whole human family. So the other northern people of Europe—the English, Germans, Scandinavians, and Russians—have been for many centuries drinkers of harder liquor, and more drunken, than the southern Europeans, yet the hopes of civilization still rest considerably on these northern people. The most abstinent people in the world nowadays—so far as alcohol is concerned—are the Mohammedans (Turks, Arabs, and the rest) and the peoples of India and China. Mohammedanism proscribed alcoholic beverages. Christ did not. The Christian nations, as a rule, have been alcohol-consuming folk, but it would be hard to persuade them that they are behind the Mohammedans and Hindus in usefulness, virtue, and the essentials of civilization. And the exterminable Jews are a drinking people, though temperate. Look at Russia. A pretty drunkard country, very ignorant, full of vodka and superstition and stupidity, but also full of strong human material. Increased temperance is bound to come in Russia with increased intelligence, a better scale of living, education, and liberty. But there is better hope for Russia, vodka and all, than for abominable Turkey.

Not alcohol is the root of much evil, but not of all. It may be better that men should think half drunk, if necessary, than that they should not think at all; it may be better that they should dare half drunk than that they never should dare. It may be better that they should be stimulated somewhat, even by drink, than that they should sink under the monotony of hopeless drudgery. A man ruled by alcohol is pretty nearly worthless, but there are grounds to think that there is a greater destiny for the nations that subdue alcohol to a wise use than for those who resolve that it is too strong for them and, if they can, abolish it. The fight with alcohol has been going on since the world began. We know nothing important about the dangers of strong drink that was not thoroughly known and appreciated by the wise at least as long ago as when the Old Testament, and especially the Book of Proverbs, was written. Alcohol has a certain destructive value in that it promotes the survival of the fittest, but we need not save it for that, for there are plenty of other things that sufficiently serve that important end. While it is disputable whether the world would be better off without it altogether, it cannot be disputed that it is a natural detail of the progress of civilization to keep the consumption of alcohol within proper bounds and eliminate the evils of it. It is right to protect from temptation the young, the inexperienced, and the weak, and to restrain or punish mischievous self-indulgence. There is no dispute about the propriety of laws to protect children from all temptation to drink alcoholic beverages, for alcohol is undoubtedly bad for children. So in various communities there may be considerable bodies of grown-ups who are so backward in self-control that they need to be protected like children from self-indulgences. So it is still with the Indians, and the strictest laws against the sale of alcoholic drinks to Indians are not objected to. So, as has been said, it is to a low extent in the South. Communities whose orderly life is really hampered by drink are warranted in eliminating the peril by whatever means they may. So, best option laws are well thought of almost everywhere, and so prohibition may become, in certain States at least, a warrantable experiment. It may be a useful process of civilization even where it is not destined to be a permanent one.

diction. States have tried it for a time and dropped it, taking high license and local option in its place. The States that are taking up with it now are either new ones, like North Dakota, where life is still mainly agricultural and comparatively simple, and Oklahoma, where the Indian population complicates matters; or the Southern States which have large elements of population of low average intelligence and a high ratio of illiteracy. Kansas and Maine are different; but in neither of them is prohibition as yet an undisputed success. Massachusetts and New York will think a long time before they come out for State prohibition, though both of them appreciate the need for temperance reform, and are hospitable to high license and local option.

One thing that makes us flounder along from experiment to experiment in the fight against rum instead of agreeing on one half of the world about how the other half lives. The other half is entitled to consideration, even though it may be a little less than half. The people who hate and fear "rum" must not hope nor even wish, even though they are a majority, to regulate absolutely the habits of folks who do not think about it as they do. Some freedom of decision about their personal indulgences must be left to responsible, well-behaved, grown-up citizens. One thing that has to be thought about in bringing up a boy is how to make him proof against damage from drink. There are two possible methods. One is to teach him, if possible, the rule of rigid abstinence—touch not, taste not, handle not—as long as he is under parental control; to teach him that alcohol is bad for drink, and to avoid it as the only safe rule. The other method is to teach him that alcohol is dangerous and insidious; that it is a ruinous master, and a servant of questionable usefulness; that if drunk at all it must be drunk with unflinching discretion; that, nevertheless, since it is a thing enormously consumed and that one runs against it every turn, it is worth understanding; finally, that only a small proportion of the people one sees in the more active centres of population are teetotalers, and that very many of the men who are most conspicuous and most successful in our world drink intoxicants more or less. You may choose which method you will. The trouble with the first is that there will come a time when the boy will make his own observations and follow his own judgment. If his conclusions about alcohol do not tally with what he has been taught, the parental teaching will go for nothing, and he will make his own experiments with very little trustworthy knowledge and no familiar example to guide him. Those who think the second method is the sounder and safer will tell you they have seen too many drunken sons of teetotal fathers to have confidence in the first. And yet, in the matter of sons it is better to be lucky than wise, for in some of us that is born that makes us safe from the perils of drink, and in others not.

Diversion

"CHANGE ever cometh, variable dolebreath, and shifting dispair," writes MONTAIGNE, noting how prone is man to shrink reality, and if life be such as to hold him for a certain portion of his time close to the dry fact, as swiftly as he may, he throws aside the burden, shuns the brunt of the actual, and turns to some form of make-believe or play. Childhood is largely a great playground wherein the child pretends to be and to have what is not in heaven nor earth nor any place but his own darting fancy; youth is a vast field of dreams and visions where once more life is recreated, and the youth sees by the light that never was on land or sea. Yet all through the years something different, something compelling, is forcing its way into our ken the nature of things as they are. If the child plays to enlarge his limits, if he is the nursery that he is, he imperceptibly becomes and warbles and hums, a man's diversion is more often an escape from realities too vast to be borne. Who has not come in covering, after an hour or two under the open sky with the stars, glad of the safe narrowness of four walls and the fairness of the flickering candle-light? Most of us, in maturity, lose bondage better than liberty, and self-delusion better than truth: "bondage with ease more than strenuous liberty." Only the fewest can strain the mind to meet the facts, the uncompromising facts of life, all the time. Actuality wearies, reality weighs too heavily, external circumstances are too slightly ductile and plastic, and to the frail and ill-poised human being it is a great relief to flutter off to a quiet corner or a happy imagining. Max is, indeed, a part of the universal flux of nature with no fixed center, and the ideal is ever far beyond, so difficult to keep the eyes fixed upon, that any turning aside is restful. We use activity to drown grief in; thought has power to smother emotion, and perception extorts quiet from the will. So we pass through life using one faculty to lull another lest the press of reality should be unbearable.

"Ever we think of something else," says the old essayist again. "Either the hope of a better life both settle and support us, or the confidence of our children's worth, or the future glory of our name, or the atoning of this life's misdeeds, or the revenge

hanging over their heads that have eased and procured our death."

Those, probably, are the happiest among mortals who require the least diversion; who so adjust themselves to reality that they rejoice in it; are glad of it; neither stretches of spare nor time apall or weary them; the lushest star would offer some friendly experience, and eternity is in the moment in them. Of the most exalted of human beings one cannot conceive their desiring or turning to any diversion whatsoever. They are adjusted to reality; they are perfected so that life, as it ought to be, is complete satisfaction. One cannot fancy the Buddha desiring diversions, though one knows of *Siddharta* that he could hardly enjoy a jest at his own expense. Perhaps he thought in terms of eternity but hardly yet lived in them.

If no one has yet said, "Tell what you laugh at and I'll tell what you are," they ought to have done so. For taste plays its part thoroughly in the whole matter of diversion, and there is no more continuous strain upon a close relationship than a different taste in jokes and diversions. How pathetic was the tale of the aspiring young girl whose kind godmother took her to the metropolis for the first time, and when she asked for afternoon tea at *SURNAME*'s, took her to *FLICKER*'s for tea, and when she wanted to go to a symphony concert, substituted the Hippodrome. A careful mother who had moved into a new neighborhood was much distressed to find that the favorite game of the children in the vicinity was in imperative self-defense and make arrests. But the games of her more instructed three-year-old son proved equally offensive to a different taste; for, when a neighbor was paying her initial call, the child escaped from the nursery, crept up back of the lady's chair, and held a stick near her head. He was reprimanded, and the caller kindly suggested: "He must be playing policeman." "I'm not," asserted the lady. "I am *Thesens*." And when the mother said, gruffly, "But *Thesens* would never have held his stick over a lady's head," the child responded: "He held it over an odd witch when he wanted her to vanish."

Surely the notorious dinner recently given in Baltimore to which diversion was contributed by a woman going in as an abashed bathing-suit and being plunged in an improvised fountain, and another woman impersonating an opium fiend, and a railway president playing at surgical operations of an unimpeachable nature, bespeak a rather alarming mental condition among the participants. It would seem that a nation oblivious or merely contemptuous of such a phenomenon was not rightly looking after all its indulgences. For it is a question whether mental influence is not as destructive a force as physical squalor and distress.

Surely when philanthropy has developed a little further there will be reformatories or asylums for the imaginatively poor, whose sole idea of diversion from seriousness is to impersonate crime and vulgarity. On the Elizabethan stage insanity was considered a great feat, as is very low forms of entertainment even today drunkenness still amuses.

What one sees especially as the modern development of diversion is that as people rise in the scale of being they are less and less inclined to find relief, diversion, or fun in what might cause another pain. Second, that diversion at best is but a relief, a turning aside from the true and the actual, a discovery of unexpected incongruity in appearances. And that the better a man's life is the less will he need diversion from the true nature of things. One cannot fancy KANT, or PLATONUS, or DARWIN, or MILL desirous of diversions. They were launched on a work so absorbing, so real, so delightful in itself, that no turning aside was needed. Indeed, real greatness of character manages always to take delight in life as it is, and its task seems ever to be to delve deeper into the true nature of fact. *BROWNING*, who combined intellect with finely poised character, never seemed to weary of life, and felt that time was not long enough to live in, and so he projected more and fuller life beyond death. It is something to live unshadowed by fancies, nobility by promises of future bliss, finding essential joy and serenity in the moment as it passes, and the true nature of fact as fair as any diversion.

But, at any rate, such diversions as are necessary should aim at innocence, healthfulness, friendliness, typium eating is a diversion from actuality; so are bridge whist and the habit of novel reading; all of these substitute a fictitious world of interest for real ones; but they fall short of innocence and healthfulness, and one at least introduces an element of competition which is best eliminated from life if perfect friendliness is to prevail. The spread of opium plays, the cult of growing things adorning the face of earth, the study of history, and, above all, the history of the development of human thought, the appreciative love of all or of any of the arts, these are diversions which make for the real decoration of life.

Personal and Pertinent

A RETURNING traveller tells us that the island of Jamaica is full of rum, cheap, pretty good, and sold everywhere. The island is also full of negroes. Yet the negroes are described as peaceable.

orderly, and not drunken. The traveller we quote says that he saw only one who showed symptoms of overstimulation. Rum may be different in Jamaica. Negroes certainly are different there.

In New York one day last winter the Hungarian count who married Miss VANDERBILT held noisy hands on a newspaper photographer who lay in wait to snap-shot the young lady as she got into her carriage. Then we blushed for the public manners of New York. But, alas! when the young people got to Budapest it was still worse, for not only were they surrounded by begging letters, but the flashlight photographers put the bride's life in peril in the evening by flooding magazines powder at her, to the dismay of her carriage horses. Then the count blushed, and the cable news reporter him as saying angrily that it hurt his national pride to find such barbarous behavior in his own capital. We have read before that Budapest is a very modern city. So it seems to be, flash-lights, manners, and all, more's the pity!

Correspondence

SATAN AND SPIRIT PHENOMENA

St. Louis, Mo., February 25, 1904

To the Editor of Harper's Weekly:

SIR.—In the interesting account of psychic experiments published in your Journal of February 29 I read an allusion to Hudson's explanations. Hudson wrote well and thought well, but his theory is not acceptable to many practical people who have no hallucinations, and who have had experiences with which no "medium" or spiritualist had anything whatever to do. Before me lies a little book issued by a worthy and active religious society (not Catholic) which declares that the so-called spirit phenomena occur, and that they are clearly the work of Satan. I would rather accept this than Hudson, though I have studied well the evil side of the manifestations, and have failed to find in them anything exceeding the commonplace wickedness of "this side." I wish Hudson were right. I would give everything I have if I could be satisfied that death ends all. Not that I am a great sinner, but because eternally seems so very long and tiresome. The rest of the grave appears to me so perfect that I cannot conceive of anything better for us all.

I AM, SIR,

DONALD PADMAN.

FROM A PHILOSOPHICAL READER

Denver, Col., February 8, 1904.

To the Editor of Harper's Weekly:

SIR.—I want to say that I have had a good deal of entertainment out of the space you devote to letters from the people. There is with me a certain satisfaction in reading letters from people, many of whom, so I should have been reading the WEEKLY, like myself, almost continuously since the time of the Civil War. Incidentally, it occurs to me that most of the time I disagreed with the editor on many lines of thought. Right or wrong, editors are apt to be far in advance of the lay person in their lines of thought. (Of course they are); their positions demand it!

I never quit a paper solely because I disagree with the editor about politics or other subjects. I notice some pretty warm and well-written letters, however, which were in the nature of a farewell. I notice that the misapprehension of me on the part of your correspondents is your line of strictures on "Teddy." Seems to me an editor should not be taken too seriously; after all, what one man says in a big country like this doesn't hurt very much unless he be the President, and not always then. Editors of free-trade Democratic papers, like the WEEKLY, could hardly, in the nature of things, be expected to be handling Roosevelt leniently all the time—at least, not at this time of year, when we are near a convention time.

It is a little soon, I think, to be absolutely certain that the President precipitated a panic by preaching. Even if he did, as far as I am aware he will be soon forgiven by the mass of the people. They like an impulsive man.

The thinkers and leaders of men, while they may think that preaching is out of the President's line and not dignified, will also forgive him for saving the country from Bryan.

If Bryan is defeated the third time it will be in a measure because the wind has been taken out of his sails.

Roosevelt is certainly entitled to the credit of giving us a foretaste of what Bryan would carry in an extreme that would result in many socialistic schemes being fastened on to the country.

It seems that now the public will welcome a President who will work quietly, however much energy he may employ.

It may seem that way to me because that is what I want. I need a surprisingly large number of men, however, who favor ruthless treatment of corporations, and no more so far as to say, "If we cannot have Roosevelt, let us have Bryan." Doubtless few of these men have read the *French Revolution*. As Professor Langbein recently said, "It is one thing to lop off rotten and diseased branches from the tree, but it is another thing to hack at the very trunk of the tree itself which feeds the sound parts of the organism." There is an imperative need of discrimination and wisdom in politicians who in the past seem to have been unaware how easily confidence can be destroyed. The bull-dog

the chain shop method will not do with the delicate mechanism of financial affairs.

It is no answer to say that the attack was only intended for the secondaries and the 'bad' corporations. The facts unmistakably show that the unthinking public were led to believe that almost all large organizations were criminally conducted, and State legislation has followed without careful consideration of the good and the bad. Wisdom in this direction is indispensable for the immediate future."

I have been hoping to see the WEEKLY adopt some well-digested plan for providing an elastic quality to our currency system, since the best financial authorities say such elasticity would be a great advantage in protecting the stable business interests from the results of a financial scare. A United States Bank seems to have comparatively few advocates. Yet that is the only time-tried plan of them all. No doubt it would be denounced as a trust in certain quarters, and of course Bryan would call it an octopus. Certainly this currency question is pertinent and timely. It, of course, does not appeal to the imaginations of the people, like others which have tended to disturb business, but it will appeal to the business community on account of being designed to produce settled business conditions. The WEEKLY, standing as it certainly does for sound and favorable business conditions, could advantageously take up a matter of such a nature.

Is not the Alabaird bill merely a political makeshift, or only a palliative, instead of a positive and lasting remedy?

I AM, SIR,

HUBERT GARST.

FOR DOUGLAS AND FOLK

February 25, 1904

To the Editor of Harper's Weekly:

SIR.—Are not the Democratic nominations for President and Vice-President of these United States worth a contest? Is there no patriotism in the hundreds of Democratic leaders of this great party who are qualified to face the Presidential chair? Why this indifference? Is not the nomination a worthy one? Is it the duty of all good Democrats to once more make an effort to conduct the affairs of this government on Democratic principles, and can we not afford to put in a few months for such a cause, and even should we lose, is it not a consolation in knowing that we have done our duty, and there are many earnest Republicans anxiously looking to us for a solution of the present condition of affairs?

Labor will join with us in this campaign, for the laboring classes realize that the politicians, who are destroying all opportunities of labor for their own selfish purposes—and for no other reason than to parade themselves in the limelight—have nothing to lose, and should they not be successful in this campaign they will soon be forgotten.

It would be easy for the Republican administration, if it is sincere in its belief that monopoly and corporations are absorbing the resources of the country for their own selfish purposes, to recommend that these monopolies be denied the benefits of the protective policy, and once more allow the great masses of the common people to participate equally in the great re-sources of the nation.

Should not the Democratic party support ex-Governor Douglas of Massachusetts, or Judge Gray of Delaware, for the Democratic nomination for the Presidency? Either nomination would be a credit to the party, and each would make an ideal President, but at this time Governor Douglas seems to be the best organizer and leader, for in his winning campaign when elected Governor of Massachusetts he carried to success the only issue that has been Democratic for the last twelve years.

His magnificent campaign for tariff reform enables him to head the national ticket, regardless of whom the Republican candidate will be. The Democratic party can then disavow all connection with theories that are unwarranted and visionary in their applications and appeal to the intelligence of conservative voters, for it is the duty of all good Democrats to organize and fight for Democratic policies that will once more reconvert the business and commercial interests of this country.

For Vice-President, the present Governor of the State of Missouri would be an ideal candidate. He has reformed that great State from machine and ring politics; he has elevated the moral atmosphere; driven the lobbyists from legislative halls, forced the railroads and corporations to protect life and give good service to the people. He has done all this without any bare of trumpets, or inspiring a single legitimate industry in that commonwealth. The Democratic party cannot but with Douglas and Folk as its standard-bearers.

I AM, SIR,

GEO. MURPHY.

(Chairman of the National State Democratic Delegation to St. Louis, 1904.)

HELPTU, TO A MINISTER

Minneapolis, Minn., February 25, 1904

To the Editor of Harper's Weekly:

SIR.—I am a Methodist pastor. I want to say to you I get so *revved* very much from your editorials in HARPER'S WEEKLY. They give me higher ideals, higher spiritualities; they are instructive and inspiring. They are a big force in making life "Worth While."

1. Are they ever collected and published in book form? I hope so. Let me know first.

2. I am not a grammar, but I wish they might be published on two sheets, instead of on the two sides of one sheet, so the two parts are back to back, for I clip them, and would so much rather have them on two columns, side by side, than back to back.

I AM, SIR,

J. S. WILLIAMS.

Finance

The Relation of Crops to Prosperity

By HOWARD SCHENCK MOTT.

ALTHOUGH our manufacturing activities have reached magnificent proportions, although our cities expand with the growth of an unrelieved commerce, the United States remains fundamentally an agricultural community. Our protective tariff policy, whatever may be its merits or demerits as an economic proposition, accordingly recognizes the value of the "home market" to the manufacturer, and the commerce of our cities derives its motive power from the fuel furnished by wheat, corn, and cotton.

For a decade past, year after year, with change only in degree, the Great West and the Sunny South have yielded their steady accretions to our national wealth. In the Middle '90's the farmer of the West was invariably in debt to the Eastern capitalist, and many a mortgage was foreclosed, but nature has smiled on him since then. He has paid off his mortgage, or reduced it, and his farm has risen in value. Improved machinery and better methods, such as dry farming, have helped much to make him prosperous. Wheat and corn and rye and oats and even cotton are produced from such a wide area that similar adverse climatic conditions do not affect any considerable portion of the total area under cultivation, and general crop failures have become highly imprudent.

That the tremendous activity of the United States in trade and commerce during the past few years resulted largely from the bounty of nature delivered from the harvest fields admits of no doubt. The size of a season's crops certainly is not the sole factor determining prosperity or adversity. The other factors are many and their relative influences complex. But no one of these exceeds in importance the value of the crops of the country, so that it is worth while to turn to the records of the past to discern the possible or probable effect of good or bad crops this year.

Comparisons of the panic of 1897 with previous panics customarily regard mainly such things as the duration of Clearing-house certificates and of a currency premium, failures of banks, and receiverships of railroads. The fact is frequently overlooked that meanwhile nature works quietly either to aggravate or to mitigate the industrial disturbances that bring their origin in such causes as abuses of credit, speculation, and reckless extravagance. In this country our wretched makeshifts for scientific banking and currency legislation always aggravate a crisis. With these phases of crises it is not our present purpose to deal. Let us here leave the troubles of 1897, its comparison with those of previous periods, were influenced by the country's harvest.

As the wreckage of the panic of 1873 was being cleared away, and resumption of specie payments occurred early in 1878, a freak of nature gave to prosperity a sudden stimulus. The wheat harvest of Europe in 1878 was extraordinarily large, but the following year it was correspondingly small, in England the driest harvest assuming the proportions of a national calamity. In the United States, on the other hand, 1879 witnessed the largest harvest in its history. The loss of Europe was this country's gain, particularly as heavy agricultural exports turned the tide of foreign exchange in favor of the United States, and dissipated apprehensions as to the success of specie resumption.

In the spring of 1884 there was a financial disturbance of some proportions. It was followed by a great crop of very large size, not only in the United States, but all over the world, with corresponding low prices. In 1885 the American wheat crop was the smallest in four years, and the European crop was as large as that of 1884. Again the American farmers received low prices. There was great discontent among the farmers, and labor troubles on the railroads were prevalent. The discontent among the farmers led, as it did eight or ten years later, to agitation for more currency.

Up to the panic of 1893 the one most fruitful source of financial disturbance has been the disorders in our currency system. When the disorders of these disorders became imminent, they were occasionally stayed off by such incidents as that of the harvest conditions of 1879. The crop conditions of 1891 were similar to those of 1879, and the reckoning was again delayed. Europe experienced a severe shortage in its wheat crop, whereas the United States produced 312,000,000 bushels more than in 1890, and 25,000,000 bushels more than in 1892. The American harvests for the two years following 1891 were comparatively small, not only in wheat, but in corn, and this fact finally precipitated the crisis of 1893. The following year, 1894, was one of complete agricultural disaster, a fact which lengthened the period of depression. Incidentally, it fanned the flames of discontent among the farmers, and added to the strength of the Populist movement.

These are isolated cases in the long history of American agriculture, but they are sufficient to emphasize, were emphasis needed, the great immediate importance of the out-turn of the crops. To revert now to more recent conditions, only once since 1890 has the wheat crop of the United States fallen below 200,000,000 bushels, and only once has the corn crop fallen below 2,000,000,000 bushels.

In 1904 the wheat crop was 552,369,517 bushels, and in 1901 the corn crop was 1,522,519,071 bushels. Still, the consumption of the world has greatly increased, and American consumption has also increased; consequently, a difference of 100,000,000 bushels in the wheat crop, or of 300,000,000 bushels in the corn crop, is a matter that materially affects prices.

In spite, however, of considerable variation in the actual yields of grains in the United States, it appears to be a fact that the wealth produced by the crops of the country now rises steadily. This will be clear seen from the following tables taken from *The Commercial and Financial Chronicle*.

Total crops of wheat, corn, oats, barley, and rye, in bushels:

1900	1901	1902	1903	1904
2,997,567,748	4,081,435,527	4,534,456,391	4,800,752,930	4,158,610,000

Farm values on December 1:

1903	1904	1905	1906	1907
\$1,708,115,476	\$1,958,361,486	\$1,794,828,300	\$2,087,195,617	\$2,261,394,000

The showing made by cotton is not materially different, but space precludes any further discussion.

The significance of these figures is manifest, and must be accepted with caution. The figures appear, however, to establish the fact that the farmers of the country have become very prosperous. It must be true, also, that the consuming power of the farming community during the past few years has been on an ever-increasing scale, and that this has been a potent influence in stimulating manufactures and commerce. Another deduction from the face of the returns must be that the farmers have suffered from the recent panic and the present depression in business practically not at all.

What bearing have these agricultural conditions on the present situation? To answer the question, it is necessary clearly to understand the causes of last year's panic. Like other panics, it was by no means sudden or development, but was born of prosperity and nurtured of prosperity's parasites, reckless speculation, unlimited extravagance, dishonesty in high places, and, last but not least, ineffectual efforts to cure all of the other evils by legislation. The disturbance appears to have been more than usually a financial one, in a limited application of that term; for its somewhat obscure and earlier cause was a scarcity of capital, growing, first, out of the excessive need for it, and, second, out of a heavy absorption of it in security issues, and a serious destruction of wealth by wars and earthquakes.

In the light of these facts it is not possible that the cure of liquidation already administered may prove more powerful than any cure of legislation? No one can pretend to say, under such circumstances, just when liquidation has been drastic enough to bring about equilibrium. Last October's crisis was of such an acute character as to leave in its train a series of secondary troubles that will extend over a long period. The credit of the manufacturer and the railroad has been impaired and their business curtailed by forty to fifty per cent. Confidence, part of the basis of both credit and business, still waits on the outcome of events.

Good crops mitigate disaster just as bad crops accentuate it. While the harvests of 1907 did not equal in quantity those of 1906, they were well up to the average, and the mid-torque of Europe enabled this country once again to secure high prices for its grains. Europe's short crops proved to be our salvation, for they enabled us to draw \$100,000,000 of gold to our shores at a critical juncture. Since then a record crop of wheat has been gathered in Argentina, and the price of the cereal has declined. The harvest season in Argentina is the reverse of the winter of the northern hemisphere. Supplies of wheat have come upon the world's market from South America at a time when the visible supplies in the United States have reached a very low ebb. This can hardly be counted an unmitigated evil, for it keeps down the price of bread for our unemployed.

We have also found that in the past good crops have served not only to mitigate disaster, but to promote recovery from disaster. Naturally, therefore, the government crop report of April 8 was received by the financial markets with evidences of satisfaction. It is, of course, too early as yet to form any conclusion whatever as to the present season's crop, but so far the outlook for winter wheat is promising. Incidentally, the farmers seem to be meeting with some success in fighting "green backs." The stock market is likely to be influenced this year more largely than usual by the prospects for the crops, and each government crop report will be scanned anxiously. Should the Presidential contest fail to assume graver aspects than at present, should new schemes for inflation of the currency fail of enactment, should confidence return, and should European capital seek re-investment in the United States, within a few months the winter of our disaster may be turned to glorious summer—by the crops. But no one can tell now.

From Whites To Blue

THE CHANGES OF
CLIME AND CLOTHES
WITH THE FLEET

By LIEUT.-COM. PHILIP ANDREWS, U.S.N.

Executive Officer, U. S. S. *Kanawha*

SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY"

FROM the time we left the Strait of Magellan, and up to the day before our arrival here, we have all been in blue clothes, so different is the climate of the Pacific from that of the other side. The difference is caused by the cold Humboldt current, which runs north along the west coast of South America with a beneficent influence on its climate and prosperity. Here at Valparaiso, although the month corresponds to our August, it is cool and pleasant, but at sundown we shift to blue clothes.

All our runs at sea are much alike, and the first ripple of excitement on the way up the coast was a wireless message from the *Chicago* exchanging greetings with Admiral Evans and giving us some of the late news, among other things a report in the Valparaiso papers that the *Chicago* had secret orders for Admiral Evans, and that war with Japan would follow. This excited some amusement, for it was recognized at once that Captain Dagle of the *Chicago* would not send a wireless message of this character if he had orders of any kind for Admiral Evans.

Another wireless of much interest was an "underground" one sent by the operator on the *Chicago*, on his own account, to the operator on the *Connecticut*, which was as follows:

"Some men disguised themselves as fishermen and were taking soundings. The police thought that they were going to mine the bay for fish, but guess they will have to try again. Say, is Gunner Bean on the *Connecticut*?"

This message was about as important as the first one, and only resulted in an order being sent to the *Chicago* to keep the wireless operator from sending unofficial messages of any kind.

The *Chicago* passed us the day before we arrived at Valparaiso, and made a striking contrast to the battle fleet. She was first commissioned in 1893, and was practically rebuilt in 1900, so that she is really nearly twenty years old, with a battery only eight or nine years old. She was the biggest and finest vessel we had when I served on her, but looks now like a little gunboat in comparison with the battleships of this fleet.

We were scheduled to arrive in Valparaiso harbor at 2 P.M. of the 14th of February, so that it became necessary to slow down to eight knots, and then the Admiral decided to keep that speed and pass through the harbor slowly so that the people would have a

The Flag-ship "Connecticut" at Sea

good opportunity to see the fleet. There was great interest manifested, as Captain Gibertini said by wireless after we had passed out, and as was very apparent by the number of people who crowded the hills and shores on the outskirts of Valparaiso. The usual preliminary felicitations and greetings were exchanged between Admiral Evans and President Montt of Chile, and promptly at the hour the fleet strumed quietly, and with great precision as to distance and bearing, into the southern end of the harbor and around the crescent-shaped harbor to the north end, where the President reviewed the fleet from the old-fashioned training ship *General Balmaceda*. On entering the harbor each ship of the fleet saluted the Chilean flag with twenty-one guns, and the President gave another salute of twenty-one guns as he reviewed each ship.

The moral and political effect of this visit, as of all our visits to South American ports, can hardly be overestimated. The last time Admiral Evans was in Valparaiso he commanded the *Yorktown*, and this was not long after the disagreeable *Baltimore* incident, when a number of our sailors were roughly handled by a Valparaiso mob. There was some feeling in Chile at that time, and while the *Yorktown* was there the Chilean torpedo boats made a practice of ducking close by the gunboat, until Evans, who was a commander then, sent a very sharp message to the naval authorities with the result that the discourtesy ceased. In those days neither navy amounted to very much, and there was misunderstanding and a far from cordial feeling, engendered by the *Baltimore* incident. The contrast between the feeling then and the cordial friendly demonstration of to-day, and between our puny naval strength of that time and what we showed in Valparaiso harbor

The Old and the New

THE CRUISER "CHICAGO," ONCE "THE PRIDE OF THE FLEET," PASSING THE BATTLESHIP "VERMONT" ON THE CHILEAN COAST

Steaming in for the Review at Valparaiso

THE "HULKAN CRUISER" "CHICAGO," FOLLOWED BY THE "COMBATANT" "VERMONT," ADMIRAL EVANS'S SHIPS INTO THE HARBOR

on the 14th is very gratifying. The usual fine exhibition of sea manners was shown in approaching Valparaiso, and after the review the wireless outfit was continuously at work recording the very highest expressions of friendly regard and admiration for our fleet exchanged between the different Chilean officials and the Admiral.

One feature of the review struck us all as somewhat remarkable when contrasted with our own practice, and this was the noteworthy success with which the latter outside of the torpedoes was kept entirely clear of craft of any kind. Any one who has seen the difficulty with which vessels are kept clear of a yacht race in American waters will appreciate this.

After the review Mr. Hicks, the United States minister to Chile, went the following to the Admiral: "The American minister sends congratulations on the great success of the cruise which marks an epoch in the naval and political history of the world." One of the prettiest messages was the word "welcome" framed on the side of a hill by Chilean bluejackets dressed in white.

As soon as we had passed well clear of the reviewing ship and the last ship had fired its salute and rendered honors, the speed was changed to ten knots and we began our seven days' trip to Callao. Near there we picked up the Peruvian cruiser *Balaoson*, which had been sent out to meet us. Six caught us by wireless first and then joined, finally cruising in company for two days, during which speed was reduced again to eight knots so that we should arrive at the right time in the morning. Peru's navy was out to meet us, and steamers and excursion boats of all kinds, bringing people from Lima and Callao, flocked around us as we slowly steamed in, about ten o'clock on February 20. The usual naval salutes and courtesies were exchanged, and then Peru turned itself loose to catch Sister Brazil in torpedoes, buoys, and other things calculated to keep naval officers busy. The banquet, while perhaps not so large as that given in Rio, was the most perfectly managed affair I have ever seen, and might well serve as a lesson to any nation. We got on the train at Callao on time, and took the tram back at the specified time—all very unusual. The balls, garden parties, and other social functions have been going steadily on, and the President of Peru has been dined aboard the *Connecticut*. A special ball for officers and men was arranged, and this turned out more realistically, perhaps, than was intended, for I am told that two men were killed. In the ball fights here the horses are prized too much to be hurt, and they are spared any harm if possible, the men and bulls only being in danger. They tell me it was very funny to see the eager enthusiasm of three thousand American bluejackets around the ball fight,

The Fleet's Reception by the Chilean President
PRESIDENT MONTE, WHO IS ABOARD HIS YACHT-MANNED FLEET
"GENERAL BATUNDEO," REVIEWING THE PASSING FLEET

when, as is the custom, some one threw a handful of coin out into the ring because of some successful thrust or killing; the air was at once glittering with sailor money and loud with the yells of the excited men.

The President spent a good part of the afternoon of one day on the *Connecticut* and in steaming around through the fleet, and will to-morrow review the fleet as it passes out. He will by that time be a much-saluted personage, having received no less than sixteen hundred and eighty guns over our arrival.

To-morrow we steam for Magdalena Bay—far from garden parties and banquets, and close to nature and target shooting.

"The Dawn Comes Up Like Thunder"

By CAPTAIN H. C. DAVIS, U.S.M.C.

SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY" ABOARD THE U. S. BATTLESHIP "OHIO"

NOT until I came to Magdalena Bay with the Atlantic Fleet did I know what was meant by "The dawn comes up like thunder." But I know now, for as soon as the light as strong enough to see a target 1000 yards away the thunder of

12-inch and 13-inch rifles is heard, and, commencing at daylight, it continues until dark. After a hasty dinner the long arms of the searchlights begin feeling around the bay to pick up the targets for the torpedo defense guns, which have their practice by the light of the electric reflectors. So it goes. From early in the morning until late at night there is banging of guns, and the hurry and scurry of repair boats fixing up the targets between the runs of the ship across the range. Owing to a heavy sea, we have had to move the two eastern ranges about two miles from their original position, as they were opposite the entrance, and the swell made it impossible to have the same conditions for all ships, as is required by the regulations. The edge of the beach

The Jar of a 12-inch Gun fired on the Battleship "Georgia"

THIS PHOTOGRAPH, TAKEN AT THE INSTANT OF DISCHARGE, WAS MADE DURING THE RUN IN WHICH THE SHIP HAD HIT THE TARGET SHOWN IN THE SUCCEEDING PAGE. THE GUN IS ONE OF THOSE IN THE AFTER TURRET IN THE EXTREME BACKGROUND OF THE PICTURE. ABOVE IS THE UPPER PART OF THE 5-INCH GUN IN WHICH, LAST AUGUST, EIGHT OFFICERS AND MEN WERE KILLED BY A "FLARE-BACK" EXPLOSION

around the town is covered with the various devices of the battery officers for registering the sights of their guns. This feature of the practice is most important, because if the sights are not in exact adjustment no amount of training run make a pointer hit the target. Consequently, all who are not on the range are busy getting ready for the round. The strain is great, and we will be glad when our turn comes.

In addition to practice with the guns there is practice with the torpedoes, and these most delicate mechanisms need very careful handling if results are to be smashed with them. For this reason all the maps that are able to do so are running them and making final adjustments.

Send up the balloons! Don't send up the balloons! Go on the range! Don't go on the range! No it goes. Every one keyed up to the proper pitch for target practice, and yet we can't get the chance. The change in the two ranges has destroyed the original schedule for the firing.

The *Georgia* is on our range now, and they are banging

away at a great rate. If they are making hits in the ratio of their firing we, and all the rest of us, will have to hustle to beat them. The *Albatross* and the *Hilinois* have done some wonderful shooting, and the trophy, in my opinion, will not go out of the Fourth Division. The *Albatross* made only thirteen misses out of one hundred and sixty-eight shots fired with the six-inch battery. It will be pretty hard to beat that record. Her highest scores made with the six-inch guns were made by two marines on the two forward guns, and if it were not against the Admiral's orders I would like to tell you their scores, but all that will be given out later. The *Thorpis* has made some wonderful shots with her turret guns, and if a bit better had been done with the six-inch battery the ship would have had a "look-in" for the trophy. Her after-turret, firing the twelve-inch and the eight-inch guns, made twenty hits out of twenty-five shots in three minutes and sixteen seconds. The shooting is so good that it should be known. It is particularly interesting because it was made in the turret in which the accident occurred last summer in Cape Cod Bay.

We went on the range this morning and have been firing merrily all day. We have not broken any records yet—but who knows?

was pathetic. No one knew this at the time, and the training was serious in its purpose, but ridiculous in its attainments. We can only say this now because we have learned what we can do. In ten years more we may look back and say exactly the same thing of the training of to-day. To-day it is the best training we know of, and in 1888 it was the best training we knew of. Consequently, all these statements are comparative and must be considered as such.

When Captain Scott, of the British navy, sent in his first reports of his target practice, conducted under the scheme he had originated, it was so vastly superior to anything any other ship of the British navy had done that the Admiralty politely refused to believe him, and would not be convinced that his records were not "assumed" until they had seen his gunnery shoot. It is a modification of his plan that is now in use in our navy, and had any one thought of it and perfected it ten years ago and sent in records of it there is not the slightest doubt but that his reports would have had the same reception as Scott's.

Road races and boxing bouts are being held by the ships which are waiting to go on the ranges, and as there is absolutely nothing for the men to do except such things they go in for them with a

THE TARGETS WHEN THE BATTLESHIP "OHIO" AFTER-TURRET FINISHED A RUN. TWELVE 8-INCH AND THIRTEEN 12-INCH SHOTS WERE FIRED IN THREE MINUTES AND SIXTEEN SECONDS, AND OF THE TWENTY-FIVE SHOTS TWENTY WERE HITS ON THE SCREEN, WHILE THE OTHERS CUT DOWN THE FIRST TARGET ON THE LEFT. THE FIRE WAS THEN CHANGED TO THE SECOND TARGET FROM THE LEFT.

THE BATTLESHIP "OHIO'S" TARGETS AFTER TWO 8-INCH GUNS HAD BEEN TRAINED UPON THEM. OUT OF TWENTY-FOUR SHOTS FIRED THERE WERE TWENTY-THREE HITS. IT IS LIKELY THAT THE TWENTY-FOURTH DID NOT FLY VERY FAR FROM THE MARK.

TWO REMARKABLE SCORES MADE BY THE GUN-POINTERS IN NAGDALENA BAY

When we had our night firing some very amusing things happened. We were looking for the turning buoy after one run, and the man on the search-light picked up a sea gull, so the wiper and turned his light full on it. For a while every one thought the gull was the turning buoy, and the mistake was not discovered until we were well around on the turn. We had to put the helm hard over the other way to get straightened out.

We finished our target practice about twelve o'clock on Sunday. I am certainly glad it is over. The strain has been rather trying. On Monday I took out the best guns for their record practice, and in the afternoon the torpedo-boats had the centre of the stage, firing to the rough water. It was impossible to finish the boat guns, so they must have another trial.

While we were on the range on Saturday we got a long-line fouled with the *Ohio's* starboard propeller and had to send a diver down to clear it. The captain's Japanese steward was a very interested observer of all the proceedings. He and the wardroom cook have not overlooked a chance to see all that was taking place during the record practice. I think it was rather a good thing for them to see. We also had "a live ship for action" on Monday morning, and the day was a very busy one for all hands. When the Admiral's inspection is over we will be able to sit back and take things easy for a while. The men are planning a show when all the work is done, and there will be something in talk of besides scores and guns.

There can be no doubt but that compared to the target practice of to-day and the training of to-day the practice at Santiago was very poor and the pointers very poor. The training given gun pointers then and for some years afterward was so fearful that it

will. Scholberg, a heavyweight candidate of the *New Jersey*, finished a dark horse from the *Connecticut* in less than three rounds a few nights ago. The new man's name was Koch, and while he made a game fight he was so much outclassed that Scholberg said to him in the second round, "Try to live out this round and then give it up; I don't want to punish you too much," and as Koch was practically unable to defend himself in the last half of the third round the fight was stopped and the decision, of course, given to Scholberg. The more I see Scholberg fight, the more I become of the opinion that he will win the belt this year. He is in the pink of condition, and certainly has a mighty hard "wallop" to hand out when the occasion presents itself. Some of the crew of a Mexican gunboat which came in the day after we got here were interested spectators at the fight, and although it is not their style of fighting they enjoyed it, and were much excited over some of the fast exhibition bouts of the lightweights.

By way of diversion Edgar and Gine and Garton of our mess went out with a seining party the other afternoon. They selected a sandy beach about three miles from the ship, and when the first haul was made a shark about seven feet long dashed madly through the net and went directly between Gunner McKenzie's legs. McKenzie went up in the air just like a balloon. I had no idea a man could jump so high, but a shark can make one extremely active in the water. The party caught a choice collection of skates, squid, and turtles, and finally quit with three small fishes. Gine plucked a lot of weeds along the shore for our entreprieux. He says they ought to grow, as they need so little water. The distilled water on board will not keep plants alive.

The Menace of the "Dreadnoughts"

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

LEWIS.
A few serious Englishmen meet nowadays to discuss their country and her position and prospects without a sense of impending crisis, without feeling that the next quarter of a century, possibly even the next decade, is destined to be a crucial period in British history. Their anxieties for the most part relate to and gather around, as it is inevitable they should, the condition and relative strength of the navy. These are matters never for long out of the mind and consciousness of a nation whose very existence as an independent Power depends upon her supremacy at sea. Just now they are in the deepground of British thought and speculation. Within the last week or two Parliament has discussed them with the thoroughness and ability that are never wanting when Englishmen debate the details and principles of naval policy. But the debates cannot be revived by a dispassionate mind without many mingled feelings. They afford some solid grounds for satisfaction, but more for disquietude. Their net result, in my judgment, is to accentuate the seriousness of the crisis that lies ahead.

All the world knows that the rough and ready principle by which Great Britain regulates her naval policy is the two-Power standard. The British fleet must always be more than equal to the two strongest fleets that may be brought against it. The recent debates have shown that both Liberals and Conservatives are at one on this point. The speeches delivered from the two Front Benches were explicit. I will not weary you with quotations. It is enough to repeat that between the leaders of the great historic parties there is an absolute unanimity of opinion as to the standard that should guide British naval requirements. There is also unanimity on another and not less essential point, and that is that for the present, so far as this year is concerned, the standard is being fully maintained. On these two points, therefore, the country may fairly set its mind at rest. The present government is definitely pledged to the maintenance of an inviolable standard at sea, and for the moment, at all events, that ascendancy is secure.

But that is about all the consolation to be derived from a perusal of the debates. They were harassed by an incident which no Englishman will affect to regard as other than of the gravest national moment. For the first time in British history estimates, framed by the Admiralty and agreed to by the Cabinet, have been attacked before their presentation to Parliament, and have been cut down at the last minute in obedience to political pressure. That is a development at once unique and ominous. A large section of Liberals, intent upon economy at any cost, forced upon the government a reduction of the naval vote. Nor is that the only incident which has aroused some justifiable misgivings. No one can fail to perceive that the debates were animated by a temper that has never before found such free expression. After the estimates had been printed, but before the House had debated them, a resolution was passed by one Liberal M.P. and seconded by another advocating the reduction of British expenditure on armaments, on the ground that the country was spending far more than was warranted by the needs of the situation, the reason for the two-Power standard having ceased to exist. Seventy-three Liberals and Labor men, in spite of the appeals of the government, went into the lobby to support that resolution. That is in itself a severity, three voices were in effect cast against the two-Power standard both as a principle and as a policy.

The arguments of the economists are at least easy to understand, whatever the precise value one may attach to them. They see that within the last six years the international situation has altered enormously to Great Britain's advantage, that old-standing enemies have been reconciled, that new and potent guarantees of peace have been multiplied, and that, except in one quarter, the menace of war, so far as human prevision can secure it, has been effectually dispelled. They see, also, that, in spite of this, the naval and military estimates continue to mount up with an appalling rapidity, that the path of social reform grows, if anything, even more congested, and that no improvement in Great Britain's relations with foreign Powers appears to affect to the slightest degree the demands made upon the public purse by the Admiralty and the War Office. If they declare, the Anglo-French *cordon* means anything at all, then surely it means that for all present purposes France may be wiped from the list of possible enemies. If the alliance with Japan and the agreement with Russia possess any genuine worth, then surely it follows that for many years to come the Far East need rarely be an object of Great Britain's diplomatic or strategic solicitude, and that the garrison on the Northwest Frontier may be safely reduced. When no such consequences ensue, the conclusion is that the cabinet has been bewitched by its technical experts, who, like all experts, are utterly indifferent to economy so long as they are allowed a free hand.

The argument is a plausible one. More than that, it represents a type of reasoning which is veritable to grow in popular favor.

That it is opposed to and flatly contradicted by the teachings of history and experience, that it ignores the inherent instability of even the most solid-looking structures of international friendship, and that it leaves entirely on one side the subsidies, bribery, and complexity of modern warfare, and the years of infinitely detailed preparation that must go to the winning of a single battle—all this will not prevent the advocates of retrenchment at any price from meeting with a constantly growing support among the British masses. Democracy is enthralled, is greedy of material comforts, is suspicious of all armaments, and it is not as yet by any means well grounded in the realities of national existence. There never was a time when the popular mind was more engrossed with schemes of social reform. Only a day or two ago a bill was brought forward in the House of Commons, and one hundred and sixteen members voted for it, providing that whenever a workman had registered himself as unemployed it should be the duty of a specially created local authority either to provide him with remunerative work or to maintain him and his family until work could be found. That, no doubt, is an extreme sample of the sort of reform with which England is being urged to experiment. But the air is full of projects only a little less dubious and only a little less expensive, and many of them the government has adopted—old-age pensions, for instance, a humbler but still costly plan for dealing with unemployment, and many other special and educational reforms that all need money. I am not expressing any opinion as to the intrinsic merit of these schemes when I note, first, that they create an atmosphere in which attacks upon armaments are easily propagated, and, secondly, that their financial demands must very seriously impair the capacity of this country to maintain the two-Power standard. Indeed, if Englishmen were honest with themselves, they would frankly face the fact that their naval supremacy is threatened so much by an alien Power, as by their own sentimentality, short-sightedness, and distorted perspectives.

There is another factor which aggravates the strain, and that is the evolution of the *Dreadnought* type of battleship. I think most Englishmen regard the *Dreadnought* as a mistake. In the old design of ships, the armor, the guns, the speed, and the armament were so much difficultly maintained in an enormous iron. It was not to her interests to initiate a new type. If any other nation had conceived the *Dreadnought*, then England would have been bound to follow, and if possible improve upon, the example thus set. But it was none of England's business to set the example herself, to give a new spurt to naval competition, and to invent a type of ship so manifestly superior to all other types as to make them not indeed obsolete, but ineffective by comparison. It is now pretty clearly realized that the building of the *Dreadnought* instituted a new scale and standard of naval rivalry which, instead of reinforcing, positively injures Great Britain's ascendancy at sea. The *Dreadnought* is being in a class by themselves, a stress of competition has been practically doubled. All nations with feverish unanimity have taken to building them; a vast amount of expenditure that would otherwise have been postponed or avoided is thus being incurred; new harbors, bases, and docks have to be constructed for the reception and protection of these monsters. England's start is only a matter of a year or two; and the demand is inevitably made that in *Dreadnoughts*, as well as in all other classes of war-ships, the two-Power standard shall be maintained. Thus by her own action, through her own lack of foresight, Great Britain finds herself committed to a struggle absolutely unprecedented for magnitude and expense in all naval history. And the opening of this struggle coincides with the steady growth of a political party that is determined to devote every penny of public money on which it can lay hands to the work of social reform.

It coincides, too, with the sudden and determined leap of Germany into the arena among the first naval Powers of the world. This is a development that promises for many years to come to be the pivot of European policy. Great Britain distrusts Germany. There is no, or at any rate very little, expectation that Germany will ever venture to attack the British navy single-handed. But there is a very real persuasion that if Great Britain and any first-class Power were to become involved in war, Germany would seize upon the opportunity to attempt the overthrow of British maritime supremacy. Englishmen therefore regard the growth of the German navy as a matter that affects the very foundations of their national security. They realize that Germany is in many ways better prepared than they are themselves for the struggle that lies ahead, that no doubt either of finance or in internal politics or of popular lethargy will prevent Germany from building a fleet almost, if not quite, equal to their own, and that before another fifteen years are over it may be for Great Britain a question of maintaining not her relative but her actual ascendancy at sea, not the two-Power standard, but her superiority over a single one of her rivals. Quite apart, therefore, from questions of naval distribution, efficiency, education, and administration—and on all these heads the policy of the present Admiralty is widely, though I think unjustly, criticised—Englishmen feel, and rightly feel, that they are nearing a crisis of unparalleled complexity and peril.

Bringing Aboard a recovered Torpedo

AFTER A TORPEDO WHICH IS A VERY EXPENSIVE PIECE OF MECHANISM, HAD BEEN DISMANTLED AT A TARGET IT BE CAUGHT AT THE 1500 YDS. BEYOND AND TOWED BODILY BACK TO THE SHIP FOR REARMAMENT AND RECHARGED WITH COMBUSTIBLE AIR FOR ANOTHER SHOT. IN SUCH PRACTICE THE TORPEDO CONTAINS NO EXPLOSIVE

ALTHOUGH at the time of writing the official figures have not been made public in detail, it is generally known that the battleships of Admiral EVANS' fleet have made notable scores upon the targets in Magdalena Bay. The correspondents with the fleet have been prevented from making public the work of the batteries by an order from the Commander in Chief, which said, "No state-

ment of scores shall be forwarded, or whether ships do well or badly." But Lieutenant H. D. White, who went to Washington to make a report upon the fleet's shooting, made this statement before starting eastward: "Each and every ship in Admiral EVANS' fleet has beaten its former record by a good margin. The world will be astounded when the facts come out."

THE PASSING OF THE "AMEN CORNER"

THE FIFTH AVENUE HOTEL, ONE OF THE MOST FAMOUS HOTELS IN THE WORLD AND FOR ALMOST HALF A CENTURY THE SOCIAL HEADQUARTERS OF THE REPUBLICAN PARTY, WAS CLOSED TO THE PUBLIC ON APRIL 4. IT IS TO BE TAKEN DOWN TO MAKE ROOM FOR A NEW HYPER BUILDING. THE PHOTOGRAPH SHOWS SENATOR THOMAS C. PLATT (IN THE DARK HAT) SITTING IN THE EXHAUSTED "AMEN CORNER" IN THE MAIN CORRIDOR. IT WAS FROM HERE THAT THE POLITICAL DESTINIES OF NEW YORK STATE WERE FOR MANY YEARS DIRECTED BY ITS REPUBLICAN MASTERS. THE FURNITURE CONSTITUTING THE "AMEN CORNER" IS TO BE SET UP IN THE CORRIDOR OF THE HYPERMAN BUILDING.

In the Turret

(See double-page illustration)

THE man behind the gun" has been very far in the front in recent weeks, with the powerful feet of Admiral Evans assembled in the great coast waters and demonstrating with thousands of pounds of powder and projectile the skill of the American gunpointer. For this reason, as well as for the widespread interest which has been aroused in the nation's naval force, the double-page drawing, "IN THE TURRET," by George Gibbs, in this issue of HARTMAN'S WEEKLY, is not alone timely, but peculiarly valuable in its faithful presentation of how a gun crew looks and works in the dim and narrow confines of its "steel-walled pen." The scene portrayed is in a battleship turret which mounts two 15-inch guns, and the time is during target practice. It is a few moments after the order to load has been given.

The instant this command is issued, the plugman (the one on the left at the crank) opens the breech. By turning the crank the heavy breech-block is quickly retracted and withdrawn from the gun, swinging on its strong hinges to the position shown. The ammunition car meanwhile is on its way up from the handling-room below. As soon as the breech-block is clear the car, bearing the ponderous projectile and four bags of smokeless powder, rises to its place. The car is operated by the hoist-man (visible just over the breech of the gun and to the right). The rammer-man, who is bending forward grasping a handle in the right foreground, now operates the electric rammer by a mechanism very similar to that used by a street-car motorman. The rammer, which is constructed like a spring, thrusts forward rapidly and drives the projectile home in the gun. By this time the first loader has a grip upon two of the powder bags, which, as the rammer draws back, he swiftly unloads down into the bottom of the car and follows quickly with the third and fourth bags. In this he is helped by the second loader (the man standing at the end of the car). Instantly the rammer-man switches on his power and the charges are thrust home after the projectile. All of this is accomplished at top speed, the rammer darting back and forth like the piston of an engine. When the charges are home the ammunition car drops away and the plugman closes the breech, and the great gun is ready for firing.

The firing is done by the pointer and firer, who may be discerned in the dim light of the turret standing on a small platform back of the plugman. He does it by means of a lever which makes a contact between two electric wires and ignites the powder. The other figure in the forward part of the turret, his legs being just visible in the gloom and above the mass of the gun's breech, is that of the trainer, who trains the guns from his commanding position between them.

While the gun is being fired, the hoist-man sends the ammunition car down the hoist, which is equipped with automatically opening and closing safety doors, to the handling-room, where a squad of quick, careful men loads it again with shell and powder. Then comes the drop rear of discharge and the routine begins anew.

The copper tubes which cross the breech of the gun are compressed air ducts. The moment the gun is fired and before the breech-block is withdrawn, the compressed air is turned on and a sharp blast of it is blown through the gun to free it of all particles of burning powder, because there is no spouting of the piece as in former, olden days. The recoil of the gun is received on the recoil cylinders of compressed air underneath the gun, and the recoil is only five or six feet. On some of the ships there are four recoil cylinders, two above and two below, but the tendency is to come back to two cylinders as in the earlier types of ships. It is only when it is considered that the whole operation, including raising and lowering the car, training and firing, requires only eighteen seconds (that is, between shots), some idea of the rapidity with which these gun crews move and of the perfection of their training can be obtained. Only the modern college football team attains to anything like the speed and teamwork of these gun crews when they are in action.

The operations which have been here briefly described are precisely similar in the case of the right turret gun, which is but slightly visible in the drawing. The turret officer, a lieutenant, senior grade, stands between the breeches of the guns, where he may keep close scrutiny upon each and upon everything going on about him. The turret captain, an enlisted man who has attained that grade, stands behind him and is in communication at all times with the bridge or the commanding-tower of the ship, whence come all directions in time of action.

The "Glad Hand" in Washington

BEING SOME RECORDS OF TEMPERATURE AND
ATMOSPHERE IN OFFICIAL RECEPTION ROOMS

By A. FRANCIS WALKER

ILLUSTRATED BY DAN RAYNE GROESBECK

PERSONALITY is an abstract quality is rather rare individuals. It is not an easy thing to define, but we know it when we see it, or rather feel it, well enough. Personality creates its own individual atmosphere. That, also, is unmistakable.

The members of a national government are all likely to possess individual personality to a more or less degree. Such men are selected as the few out of the many on account of distinct and marked abilities—abilities which afford them particular aid in their dealings with men. The office places them on a pedestal, from which

He throws his Personality all over You

they can descend or mount still higher according to individual achievement.

When in Washington recently I was privileged to meet most of the members of the present cabinet, and to talk with some of them privately and leisurely. The first impression the foreigner has to his own comparison of the "big" men of this country with the "big" men of Europe is that the American lacks personality—or, perhaps, it would be fairer to say, lacks that particular attribute of personality that enables us to apply the word "distinguished." I use the term "first impression," because I think the personality of the "big" American grows upon you. His is the simple manner—even though he lives not the simple life—and his general deportment spells simplicity in plain letters.

The first outward sign of that simplicity is afforded to the foreigner by the approachableness of the American man to office. He is so easily accessible. And you need not flatter yourself that he is putting himself out of his way to be accessible and agreeable to you in particular. He is just as accessible to his own clerks, to the caller from the city, to the man from the West. He could easily say he was too busy, or ask you to state your business in writing and he would send no answer, or he could make an appointment at a more convenient season, if such appointment were deemed to be merited. But he does none of these things. You see his private secretary, say you want to see the Secretary of So-and-so, and you are admitted. Or if you write your request for an interview, you receive word the same day to call, and all is well.

Not so in Europe. Call to see any cabinet minister in England, for instance, and, unless you are a prominent personage—very prominent, indeed—or an influential constituent (remembering each member of the cabinet represents a constituency and has a seat in Parliament), you will have to be content with an interview with a subordinate. If that does not satisfy you, and you insist on seeing the political head of the department, you will have to wait for some days before an appointment can be arranged,

always granting that the minister finally considers your mission to be worthy of a personal interview. After all, however, the cabinet minister is not the least approachable of his type in England. It will take you longer to see the editor of the London Times, for instance, than all the cabinet ministers put together. That is where dignity comes in. Why it costs so much time to arrange these things in London no one has ever quite explained. But you may try it, and prove the truth of the statement. To be perfectly just, however, it must be admitted that when you have seen the distinguished foreigner in his own quarters, you probably will be quite satisfied with your visit. You will find him absolutely hudsonian and decisive. He does not procrastinate, and he is not fond of "hot air." That is pretty much of an unknown quality in European business circles.

And, after all, the foreigner's red tape is a matter of tradition. Your American who enters the diplomatic sphere and is sent to Europe, after he has resided there for a time, becomes imbued with the same conservative ideas. The atmosphere influences him, and he soon comes to believe that to be more or less inaccessible to the commonality secures unto him and to his office a certain amount of dignity and freedom from small worries, which blessings he would not have if he carried his home simplicity into the foreign world.

Apart from President Roosevelt, none of the members of the present cabinet can be said to possess an impressive or remarkable personality. Mr. Roosevelt does possess it. He radiates physical force, so to speak. To be in his presence is to realize that you are close to a big man, to an imposing figure. As he rises to greet you he throws his personality all over you—not intentionally, of course, but you are impressed with the actual, momentary meeting, the personal contact. You may be sitting in the room occupied by Mr. William Leach, Jr., the President's secretary, the windows of which room look out upon the now world famous tennis court. The President is playing tennis there with young Mr. Tiarfield and two other colleagues. He wears spectacles when playing, and he is clad in a heavy blue sweater, with gray trousers and white boots. In such "undress" he appears to be very stout,—his stoutness being a fact so real to the President himself that the conceived necessity for the violent exercise of tennis may perhaps have a very direct relation to the state of the Rooseveltian physique, erstwhile deplored by its owner.

Well, you have an appointment with Mr. Roosevelt for half past three. He is still playing tennis at ten past the hour, yet punctually at the half hour you are ushered into the President's room, and you meet quite a different-looking personage to the man you saw on the tennis court in the blue sweater a few moments since. It is in this first moment of meeting that Mr. Roosevelt's personality impresses you so. A strong figure in frock coat and other appropriate garments confronts you. The slink of the hand is strong; the look into your eyes is strong and clear. Without a doubt, there is personality personified.

By the way—and very much by the way, really—a great deal has been written about the Presidential game of tennis, but no one

The Secretary of State watches you right from the Door to the Chair

so far has presumed to criticize Mr. Roosevelt's abilities as a player. Believing there can be no great harm in it, I make the "editor" to say, as one who observed, that Mr. Roosevelt is not that you would call a "crack" at the game. He played the Bishop of London, it is true, but the Bishop of London is not a "crack" either. To be fond of a game as a means of outdoor

They all appear to enjoy life after the manner of their Chief

exercise is not to say that you are a first-class player. At tennis, Mr. Roosevelt "serves" fairly well, but he is not a fast player, not a hard hitter, and he is not good "on the volley." He is a medium player, but too heavy and too slow on his feet ever to be an expert.

To revert to more serious matters, let me say that the foreigners visiting Washington to-day cannot fail to be impressed with the fact that, politically, Mr. Roosevelt's run already has begun to set. He has pronounced himself as out of the running for the next Presidency, and a wonderfully vast section of the public, including the politicians who assemble at the Capital from day to day, have begun to take Mr. Roosevelt as a passing figure.

Speaking of Mr. Roosevelt's waning light, at the moment, so far as Washington is concerned, anyway, where everybody is talking and apparently thinking more about what Mr. Taft, Mr. Bryan, Vice-President Fairbanks, and Governor Hughes are doing than about the actions of the Chief Executive, reminds one of Bernard Shaw's charge concerning the fickleness of the American public. How quickly are your public men, let the light beat upon them ever so fiercely while they are on the "throne," relegated to obscurity! Europe scarcely ever hears the name of Grover Cleveland mentioned nowadays; seldom sees the name in print, even in an American newspaper. Yet only a few yesterday ago he was at the White House as the central figure in the United States. It is not so in Europe with great political figures. Mr. Balfour and Mr. Chamberlain, in England, for instance, were in high office two years ago. Mr. Balfour was Prime Minister, and Mr. Chamberlain, as Secretary for the Colonies, was the most talked-of man in the British cabinet. Now they are out of office—have been for two years—but they are no less prominent in British politics. M. Delcassé, French Minister of Foreign Affairs three years ago, now out of office, is scarcely less a prominent figure in France to-day than he was when at the Quai d'Orsay. But here, in Grover Cleveland's own country, Grover Cleveland is more or less of a forgotten figure. It is the case of a great many of the illustrious life, which makes the American demand a new type of automobile every year, a new fad for society's hobby, a new kind of drama every season.

Mr. Roosevelt is not out of the reckoning yet as a contending force, by any means, since, as Chief Executive, he still controls the Federal machinery, and his personal influence is great enough to make many of the wire-pullers afraid of him. But he is out of their reckoning of present possibilities, though with them as a very present and active factor in the game now being played. Should anything tragic happen to President Roosevelt to-morrow, government and popular as he is and has been, his name would be before the European public for longer, and his praises would be lauded down more surely and more lustily, than in the United States. It is the old story of the "mortal man."

No one could speak of Mr. Root as a man of strong, prepossessing personality. He resembles one's idea of a comfortable, well-to-do country parson—a Baptist or a Methodist of the old school. He cloaks himself in somber garments; he behaves quietly, with head inclined; is even somewhat deferential in his manner, and does not outwardly embody what one imagines to be the physical properties of the cabinet minister. But wait until he speaks. He is direct, positive, distinct, and his eyes sparkle. He never raises his voice, but he has no need to; you feel that he means what he says, and there need be no mistake about his decisions. His secretary sits opposite him at the same desk. Mr. Root is the only member of the cabinet who favors that arrangement. The other members of the cabinet have their secretaries in separate rooms altogether.

When you enter the reception room at the Secretary of State's department, at the very end of the long hall, facing the south, on the second floor, you are shown in by a short, elderly little-colored man who limps, but who knows his business, and suggests foreign training. You are in a large apartment wherein are hung portraits of all the former Secretaries of State—famous figures, many of them. You wait a moment or two, and then you walk into Mr. Root's private room, preceded by the little lame negro. And the Secretary of State watches you right from the door to the chair which is drawn up very close beside him, as if he were summing up your mission on the spot. He has the chair right alongside his own, as if he were slightly deaf and would make sure of hearing you. And when he has listened to what you have to say, has talked to you, and disposed of your business for you, you have had a glimpse of the man whom the diplomats in Washington consider to be the "biggest" man in the cabinet.

How the personality of the individual creates its own atmosphere—which I tried to say at the beginning of this article—is illustrated very practically in the case of the present Secretary of War, Mr. Taft; also in the case of Mr. Cortelyou. One is big physically, as well as mentally, and is jolly, bluff, and ever buoyant. And all about him and his officers suggest those properties. With Mr. Cortelyou, who has been called the "silent Secretary," all is to the contrary.

The messenger at the door of the War Office, where Mr. Taft is usually to be found when in Washington, is a fat, good-sized, portly, jolly fellow; a negro of the happy sort. Mr. Taft's chief secretary is a heavy, jolly young man, and his clerks all appear to enjoy life after the manner of their chief, that is, in regard to disposition. If they cannot do it in such an altogether "big" way, they can emulate him in the miniature, so to speak. Whether Mr. Taft has acquired the habit from his travels abroad or not I cannot say, but he adapts the foreign style of getting up on his feet to greet you when you enter his room. And when he shakes hands he makes you feel smaller than he is—and weaker. You get a hearty greeting from a hearty sort of man, and the atmosphere is breezy all the time. And he is a clever word-fencer, Mr. Taft. He can say a whole lot and say nothing, talk all around your question, and give you no positive information whatever, in a bluff, happy, contented sort of way. He has only one rival in the cabinet as a lover of that same order—Mr. Elihu Root, who is surpassed in that art.

When you go to Mr. Cortelyou's office, in a corner on the second floor of the Treasury, you feel yourself to be ushered into an atmosphere of silence. The negro messenger speaks to you in a whisper, and everybody around—these people waiting there on sofas and chairs for a chance to see the Treasurer—seems to have caught a malady which hinders their speaking aloud or making the slightest noise. There is a latticed door through which the messenger tips you, and if that latticed door slammed you

You go across as if you were walking on hot bricks

would feel as if some one had committed a crime. The messenger slides through the inner door like a shadow, comes out in the same speakable fashion, and beckons you in as another man goes out, the latter probably holding his breath till he reaches the door, to which he tiptoes with the utmost care. Everybody concentrates his gaze on that mysterious door; it is phantasmic in its very suggestion.

When it comes to your turn you go across as if you were walking on hot bricks; the messenger pulls the door open, gives you a tiny shove, and you slide into the inner room. It is not a large room. There is a big, flat-topped desk, a chair or two, and that is about all except Mr. Cortelyou. The man does not rise who can talk to Mr. Cortelyou in a robust voice. You may begin that way, but you will not go on. The Secretary of the Treasury is cold and impassive, about as opposite to the Secretary of War as one could possibly imagine. Mr. Cortelyou is pleased to see you, but he cannot express it in a very lively way. You realize that you have met a clever man, a deep man, but you come away from the interview with a sort of chill, as if you were leaving an atmosphere in which the open air of the street will surely be a warm and welcome contrast.

Votes for Women: An Object-Lesson

By BERTHA DAMARIS KNOBE

THAT masculine anti-suffragist of Massachusetts who grumbled, "When a man comes home tired at night he does not want to kiss an oversexed of the poor or a member of the school board," will soon have to move to another planet. That is, if he aspires to be really happy. For the solemn fact is that the suffragists are appropriating so much of this earth, politically speaking, that, like Alexander of old, they will shortly have to lament because there are no more worlds to conquer.

This amazing fact is to be demonstrated with authentic precision at an international object-lesson in women's suffrage, scheduled for the 15th of June at Amsterdam, Holland. This is the seven days' meeting of the International Woman's Suffrage Alliance, under its American president, Mrs. Carrie Chapman Catt, of New York. Fair representatives from twenty-two countries—think of it!—will come to compare notes, and twelve of them—think again!—will proudly report that they possess full suffrage, every suffrage except Parliamentary, or municipal suffrage. The aspiring others will either boast of minor scraps of the ballot or a fine fight for it—which means that, suddenly and spectacularly, the once despised subject of feminine enfranchisement is being discussed in noblesse every civilized region of the globe. And yet the obstinate anti-suffragist persists that women's suffrage isn't gaining ground!

This gathering in Amsterdam will be a glorification because, forsooth, such strides have been made since the Stromness Sisterhood met at Copenhagen, Denmark, two years ago. Two northern nations—Finland and Norway—have in this time crowned their women with complete citizenship. Undoubtedly interest will centre in the campaign tales told by the Finnish women, who, the first election after their enfranchisement in 1906, challenged the approval of the conventional world by seating nineteen women in Parliament. One instinctively wonders what the Massachusetts men thought when Mrs. Hediwig Gehrod was chosen to sit beside her illustrious husband. This interest will be shared by the Norwegian women, whose chivalrous countrymen, not to be outdone by their national neighbor, speedily bestowed, in 1907, full suffrage with eligibility to Parliament, though as yet no candidate has been entered in the Parliamentary race. These triumphs are more striking when one recalls that fifteen years have elapsed

So these two extraordinary achievements of two years, particularly the unparalleled spectacle in Finland, fill the "franchise faithfuls" with a new brand of hope. That is precisely why they have chosen to camp in the little Dutch country for a week, for it seems likely to fall in with the full-suffrage procession. In fact, its committee of cabinet ministers, in their proposed revision of the constitution, have strongly recommended the enfranchisement of Dutch women, with eligibility to office, and though the new shift in government may temporarily defer the final seal of approval, Holland is labelled "most hopeful" on the international list. About 20,000 persons attended an open-air meeting of the Adult Suffrage Committee at Rotterdam not long ago, ten of the twelve speakers favoring woman's suffrage, while that irrepressible blemish first unfurled by English "suffragettes" and since waved over the world—"Votes for Women"—was borne aloft in the preceding parade. After the Amsterdam meeting, the suffragists will do a little extra missionary work by one-day seasons at Rotterdam and The Hague.

"Aside from hopeful Holland," said Mrs. Carrie Chapman Catt, the drum-major of this international suffrage procession, the other day, "it looks as if England and Sweden will be the next full-suffrage countries to fall into line. Every square foot of England is alive on this subject, the House of Commons recently giving the unprecedented majority of 271 to 92 in favor of woman's suffrage. In Sweden, suffrage societies are springing up like mushrooms, forty-two being organized in one year, and on the 15th of January, for the first time in Swedish history, the King's speech contained a few favorable words. There is no doubt which way the procession is moving—across the world."

This world-wide agitation to break up what somebody calls the most gigantic monopoly of the age—the masculine monopoly of the ballot-box—is beginning to be most picturesque. The subject has been long enshrouded in a hazy reminiscence of the early days of popular disapproval when red pepper, paper pellets, and even the handy lynch-bells (to say nothing of obnoxious eggs) were employed to squelch the spectacle of that sacred trio, Susan B. Anthony, Lary Stone, and Elizabeth Cady Stanton, and, at a later time, associated only with polite papers decorously read in parlor meetings. The spectacular outbreaks in the streets of the foremost cities of the world, therefore, show the new militant spirit which promises to dominate the movement. The daily strategists of those

Woman-Suffrage Map of the World, showing the Forms of Enfranchisement granted in various Countries

Drawn from a map by Bertha Damaris Knoke

since the first of the four full-suffrage countries—New Zealand—bestowed the ballot on the sex in 1893; but the New Zealand men, not so favorably disposed as their Finnish and Norwegian brothers, still warily hold the string to the situation by reserving seats in Parliament solely for their own sex. Thirteen years have passed, moreover, since Australia began in its various states to bestow political freedom upon its women, even to Parliamentary eligibility, and though several feminine aspirants have polled a splendid vote, none has succeeded in winning the privilege of writing "M. P." after her name.

She Napoleons of woman's suffrage, the English "suffragettes," which shook the world into "taking notice"—their latest device is to dangle a kite with the words, "Votes for Women," directly over the House of Parliament which has ousted them so often—are circled in the newspapers; and the "apple-pieing" which their New York contingent ingeniously got in Wall Street the other day is familiar history. But the average American does not know that Scottish women, emulating their English sisters, recently planned a monster parade down the stately streets of Edinburgh—three thousand strong, headed by the mounted police

and Lady Frances Balfour, while it is estimated that one million interested spectators lined the streets. Over in Paris, that time-honored stronghold of feminine forbiddance, the suffragists drove through the principal boulevards to the Chamber of Deputies, bearing aloft such banners as, "Women must have votes for the taxes they pay and the laws they obey." During the late outburst of Hungarian men in Budapest for the franchise, a squad of woman suffragists invaded the ranks of the paraders to distribute 600,000 posters, beginning: "Men and women laborers—today you demonstrate for universal suffrage. You demand justice, right, and

elsewhere—in a twenty-four other States of the United States, for instance, where women have either the tax-paying or school suffrage; and, to mention one more, in France, where they vote for members of commercial tribunals and other minor offices—small signs which promise new recruits for the international suffrage procession later on.

In several other countries the suffragists are trying to edge in sideways. Bohemian women claim to have snatched an old statute which does not exclude women from eligibility to the Diet. Thereupon with enterprising promptness they have put up Miss M.

Suffragists who recently besieged Congress for the Ballot

THIS DELEGATION APPEARED BEFORE THE SENATE COMMITTEE ON WOMAN'S SUFFRAGE AND THE HOUSE JUDICIARY COMMITTEE TO URGE THE ENACTMENT OF A SIXTIETH AMENDMENT TO THE CONSTITUTION PERMITTING WOMEN TO VOTE. THOSE IN THE FRONT ROW FROM LEFT TO RIGHT ARE: MRS. IDA HUNTER HARPER, NEW YORK; MISS KATHY GORDON, NEW ORLEANS, CORRESPONDENT SECRETARY, NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION; MRS. RACHEL FOSTER AVERY, NEWARTIMORE, PENNSYLVANIA, FIRST VICE-PRESIDENT; MISS LUCY CLAY, LEXINGTON, KENTUCKY, AUDITOR; MRS. CAROL CHAPMAN LATT, NEW YORK, PRESIDENT OF THE INTERNATIONAL WOMAN SUFFRAGE ALLIANCE; DR. ANNA SHAW, MOTLON, PENNSYLVANIA, PRESIDENT OF THE NATIONAL ASSOCIATION; AND MRS. HARRIET TAYLOR UPSON, WARREN, OHIO, TREASURER. THE SUFFRAGIST STANDING NEXT TO THE MAN ON THE EXTREME RIGHT IS MRS. FANNIE FERNALD, OLD RICHARD, MAINE, PRESIDENT OF THE MAINE WOMAN SUFFRAGE ASSOCIATION. MRS. BEAVER LOCKWOOD, OF WASHINGTON, D. C., ONCE A CANDIDATE FOR PRESIDENT OF THE UNITED STATES, WEARS A WHITE-THREADED HAT, AND IN THE CENTRAL FIGURE OF THE THREE WOMEN IN THE EXTREME REAR OF THE GROUP.

equality. Don't forget that suffrage to be universal must include women." And these scenes are being repeated elsewhere, wherever a banner and a fair ballot-squitter make the necessary combination.

Added to Finland and Norway, the Amsterdam delegates will have minor gains to boast over. Undoubtedly, as an aftereffect to the international conference in Copenhagen, Denmark, that country gave, in 1907, its first scrap of the franchise to women—the vote and eligibility for boards of public utilities. The same year in "Darkest Russia," where peasant women are awakening on the subject, and every party except the extreme conservatives has a woman's suffrage plank, women of property were permitted a proxy vote in the election of the Duma. Then in Sweden, where the women possessed municipal suffrage for forty-five years, eligibility to municipal office was added; and in England, where women were made eligible as mayors, aldermen, town and county councilors, several candidates promptly entered the field and were elected.

So the "reconciliation" roll-call at Amsterdam will sound decidedly cosmopolitan. To begin: There are the four full-suffrage countries of New Zealand, Australia, Finland, and Norway—five, in fact, if one includes the United States with its four enfranchised States of Wyoming, Utah, Colorado, and Idaho. Besides, the miniature Isle of Man bestowed the ballot on women away back in 1881. Every suffrage, except Parliamentary, flourishes in the five countries of England, Scotland, Ireland, Wales, and Sweden. The municipal vote remains in two, Ireland and Canada—the former having granted eligibility to municipal office in 1902 and now the generously inclined government announces a bill for full suffrage; while the latter possesses in its nine provinces either municipal or school suffrage, or both. The mid-Atlantic report has gone broadcast that Denmark bestowed municipal suffrage early in 1908, the fact being that the government has recommended such a measure, and it is now pending before Parliament with the likelihood of passing. Is the municipal list the one State of Kansas that be enrolled. Incidentally it may be added that lesser degrees of suffrage exist

Tumora as a Parliamentary candidate to test the law. The Italian women espoused the same sort of suffrage stunt last year—and lost, so goes the sorrowful sequel—when they backed Signorina Sacchi, daughter of Garibaldi's friend and physician, in her Parliamentary contest. However, such efforts are educational.

The showing of the American contingent at Amsterdam is important for several reasons. In the first place, an American woman is to sit in the President's chair. During the first four of Mrs. Calkins' five-year regime, it is interesting to note, the International Woman's Suffrage Alliance has increased from five to thirteen countries, with fine prospects of three others joining the official ranks. The list includes Australia, Canada, Denmark, Finland, Germany, Great Britain, Hungary, Italy, Norway, Russia, Sweden, Holland, and the United States, with Switzerland, Belgium, and France as the promising possibilities. Likewise suggestive is the new spirit of the movement reflecting itself in scores of woman's suffrage newspapers which are springing up over the world. The international society has established an official organ—*Das Suffragette*, published at Rotterdam—while *Le Suffragiste* of Paris, and *Le Femmina* of Rome, Italy, serve as samples. Then, in the second place, the American delegation aspires to put up no less a feat as possible; preliminary to the great gathering, the quinquennial convention of the International Woman's Suffrage Alliance (the meetings at Copenhagen and Amsterdam are biennial) conferences. It must be remembered) scheduled for New York in May, 1910. So the president will be accompanied by a gaily host, including such well known suffragists as Dr. Anna Shaw, Mrs. Rachel Foster Avery, Mrs. Ida Hunter Harper, and Miss Lucy Anthony. Meantime, in this official making of the woman's suffrage map of the world, encouragement comes from every masculine Parliament on earth. As ex-Minister Luzzatti said recently before the Chamber of Deputies at Rome: "The whole civilized world is now agitating the question, which must be settled in favor of the women sooner or later."

The Season's Plays

"DON QUIXOTE" ON THE STAGE

By "I"

put upon the stage the immortal but pathetic "Don Quixote" of Cervantes was the forlorn attempt by Mr. Paul Kester and Mr. E. H. Southern when they set forth recently at the Lyric Theatre the former's dramatization of the novel. Mr. Southern impersonating the deluded and lovable knight. Mr. Kester, the author of the play, explains freshly his aims and motivations in turning the novel into a drama. "Many distinguished writers," he observes in a programmatic avowal, "have undertaken to interpret Cervantes' intention in portraying Don Quixote. The maker of this play has no such purpose. He ventures to present the Knight of the Sorrows in dramatic form, but, as nearly as maybe, in the very words of his creator, as available in the best translations of his masterpiece. He has taken only such liberties with the scenes and minor characters as the task of fitting them for stage presentation seemed, in his judgment, to require. Much has of necessity been omitted, words and incidents have been transposed, but little has been added."

Mr. Kester has arranged his drama in four acts. The first passes in "the courtyard of an inn in La Mancha"; the second in "the kitchen of an inn"; the third in "the courtyard of the Duke's palace"; the fourth in Don Quixote's library. Mr. Kester has used, as he says, much of Cervantes' language in the form of dramatic narration; he has put almost treasure characters on the stage; and he has contrived much in the way of brilliant accessories—pageantry, tumultuous crowds, an incidental love affair, and other theatrical props. What is the total result? With all possible respect for the seriousness of Mr. Kester's aims, one is compelled to say that it is—conspicuously—dullness, tediousness that tries endurance. The thing does not "come off." The drama moves with leaden feet, or through a business and often meaningless harlequinade that is wearisome beyond expression. And it is unconsciously long—the first act alone lasts for an hour and a quarter. There is no crescendo of interest, there is no dramatic suspense; and the author, despite the brilliancy of the mounting, the external impressiveness of the thing, is exhausted and rebellious long before the end.

It may be said that the novel, with its prodigious multiplicity of incident, its looseness of form, and its immense length, is hostile to the intentions of the most gifted of dramatists. But surely Mr. Kester might have condensed, eliminated, and selected with more scrupulous regard for the requirements of the stage than he has displayed. Mr. Southern, it must be said, is at present his one hope, and it should be noted in justice to this fine-spirited and indefatigable actor, that no lover of Cervantes' marvellous creation should miss seeing Mr. Southern's portrayal of the much-tried righter of wrongs. He has not in years done anything so fine and true, so skillful and vivid as this.

In its external effect, its emotional and spiritual suggestion, this is almost exactly the pathetic figure previous to those who in their minds hold the image of the noblest dreamer in fiction. Mr. Southern's impersonation has evidently been built up with loving and meticulous insight; it is full of exquisite detail, and it is rich in fervor. It is worth making a journey to the Lyric just to hear him enunciate the name of his beloved Dulcinea del Toboso, which he utters with a combined tender, reverent, and passionate quite beyond praise. This second achievement of Mr. Southern's is superlative.

The supporting company is, on the whole, adequate, with one exception. Mr. Rowland Buckstone plays Sancho Panza, or, rather, he borrows him. We have not often seen upon the stage a more grotesque perversion than Mr. Buckstone—usually an actor of understanding and ability—sets before us in this part. Whatever else it may be, it certainly bears an extremely remote resemblance to the Sancho of Cervantes. To what extent, one cannot help wondering, is Mr. Kester responsible?

And why, oh! why does Mr. Southern inflict upon his more or less helpless audience the elaborate programme of "vocal music" which occupies the intermissions? No less than nine numbers—sung as solos, male quartettes, in the form of particularly trivial and common music—are violently forced upon the ears of the unexpecting audience, a considerable proportion of which, let us remind Mr. Southern, are unable to sing. There are no tea rooms near the Lyric. When, one wonders in despair, will "music" be banished from our theatres? Robert Hileena once wrote a delectable tale about a music-lover who, tormented beyond endurance by compulsory hearing of much bad music, created for himself a religion of silence; he went, if we remember rightly, in the desert and fell down in worship before the Sphinx, renouncing forever allegiance to Katerpe. Already we see, in fancy, some tormented auditor from the Lyric in frenzied passage for the desert.

The proportion of New Yorkers who pass their lives in flats or apartments (according to price) may be readily estimated by the volume of applause which greets the first act of Clyde Fitch's comedy "Girls" at Daly's Theatre. This act is in a studio apartment, and as soon as the silence of night within it is fractured by the familiar hammering of the steam radiator an appreciative outburst comes from the audience. It is one of the most horrible touches the stage has given us in a long time. Then, too, a responsive discord twangs in the bosom when the brutal, overbearing junior charges in and proceeds to make himself customarily unpleasant. There are several other immediately recognizable incidents of fat life which flash one's thoughts for an instant beforeward. The play itself is very amusing in places, and more or less

instructive in the ending of its first act, with its suggestion of "Charmin" or "Shedder-calls, and quite an decorous as either. How Hilelike this part may be it is for women to determine. At any rate, it provides what has come to be known as "the Clyde-Fitch surprise." Of course when all the girls—and there are three of them—are sung in led a man gets in by mistake.

The theme of the comedy is man-hate, the three girls swearing each night a formidable oath of independence which eventually leads them headlong into matrimony. So strong is their aversion to man that postman, janitor, and messenger alike are forbidden to cross the threshold into the sacred maidenly precincts.

The second act is in a law office, and here one cannot but find fault with Mr. Fitch, in what sort of law offices do senior partners make such unpleasant love to female employees, and catch them by the ankles on step-ladders? This question is all the comment upon this that is necessary.

The man-hating waxes decidedly in the second act, when it is discovered that the young man who got into the maidenly precincts is a tragic extremity is the junior partner of the law firm which employs two of the girls, the third having gone on the stage (excellent place for a man, hater!) There, in the third act love and peace descend upon the trio and the play is done.

Mr. Southern as "Don Quixote"; Mr. Buckstone as his Squire, "Sancho Panza"

A Spirit in Prison*

A Novel

By Robert Hichens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER X.—(Continued.)

He looked round reproachfully over his shoulder.

"Signorina," he said, turning the least round, "you are like a wicked lady to-day."

"What is it, Gaspare?" she asked, this time letting him come towards her.

"I say that you are like a wicked lady."

And only the other day I was saying to the signora—

"What were you saying?"

She swam to the boat and got in.

She began to row towards the islet.

"I was saying that you are nearly a woman now."

Vere seemed extraordinarily thin and young as she sat there in her dripping bathing dress, with her small bare feet distilling drops into the bottom of the boat, and her two hands, looking drowned, holding tightly to the wood on each side of her. Even Gaspare, as he spoke, was struck by this, and by the intensely youthful expression in the eyes that now regarded him curiously.

"Really, Gaspare?"

Vere asked the question quite seriously.

"Si, signorina."

"A woman!"

She looked down, as if considering herself. Her wet face had become thoughtful, and for a moment she said nothing.

"And what did mother say?" she asked, looking up again.

"But I know. I am sure she laughed at you."

Gaspare looked rather offended. His expressive face, which always showed what he was feeling, became almost stern, and he began to row faster than before.

"Why should the signora laugh? Am I an imbecile, signorina?"

"You?"

She hastened to correct the impression she had made.

"Why, Gaspare, you are our *Froufrou*!"

"Va bene, but—"

"I only meant that I am sure madre wouldn't agree with you."

She thinks me quite a child. I know that."

She spoke with conviction, nodding her head.

"Perhaps the signora does not see."

Vere smiled.

"Gaspare, I believe you are horribly sharp," she said. "I often think you notice everything. You are brilliant. I am half afraid of you."

Gaspare smiled too. He had quite recovered his good humor. It pleased him mightily to fancy he had seen what the padrona had not seen.

"I am a man, signorina," he observed, quietly. "And I do not speak till I know. Why should I? And I was at your baptism. When we came back to the house I put five lire on the bed to bring you luck, although you were not a Catholic. But it is just the same. Your saint will take care of you."

"Well, but if I am almost a woman—what then, Gaspare?"

"Signorina?"

"Mustn't I play about any more? Mustn't I do just what I feel inclined to, as I did in the *tirotto* just now?"

There is no harm in that, signorina. I was only joking them."

He hesitated, looking at her firmly with his unblinking gaze.

"But what? I believe you want to scold me about something."

I am sure you do."

"No, signorina, never! But women cannot talk to everybody, as children can. Nobody thinks anything of what children say. People only laugh and say, 'Ecco, it's a baby talking.' But when we are older it is all different. People pay attention to us. We are of more importance then."

He did not mention Ruffo. He was too delicate to do that, for instinctively he understood how childish his padronina still was. And, at that moment, Vere did not think of Ruffo. She wondered a little what Gaspare was thinking. That there was some special thought behind his words, prompting them, she knew. But she did not ask him what it was, for already they were at the islet, and she must run it and put on her clothes. Gaspare put her cloak carefully over her shoulders, and she hurried lightly up the steps and into her room. Her mother was not in the house. She had gone to Naples that day to see some poor people in whom she was interested. So Vere was quite alone. She took off her bathing dress and began to put on her things rather slowly. Her whole

body was deliciously lulled by its long contact with the sea. She felt gloriously calm and gloriously healthy just then, but her mind was working vigorously though quietly.

A woman! The word sounded a little solemn and heavy, and, somehow, dreadfully respectable. And she thought of her recent behavior in the *tirotto*, and laughed aloud. She was so very slim too. The word woman suggested to her some one more bulky than she was. But all that was absurd, of course. She was thinking very frivolously to-day.

She put on her dress and fastened it. At the age of sixteen she had put up her hair, but now it was still wet, and she had left it streaming over her shoulders. In a moment she was going out on to the cliff to let the sun dry it thoroughly. The sun was so much better than any towel. With her hair down she really looked like a child, whatever Gaspare thought. She said that to herself, standing for a moment before the glass. Vere was almost as divinely free from self-consciousness as her father had been. But the conversation in the boat had made her think of herself very seriously, and now she considered herself, not without keen interest.

"I am certainly not a wicked lady," she said to herself. "But I don't think I look at all like a woman."

Her dark eyes met the eyes in the glass and smiled.

"And yet I shall be seventeen quite soon. What can have made Gaspare talk like that to madre? I wonder what he said exactly. And then that about 'women cannot talk to everybody as children can.' Now what—?"

Ruffo came into her mind.

"Ah!" she said, aloud.

The figure in the glass made a little gesture. It threw up its hands.

"That's it! That's it, Gaspare thinks—"

"Signorina! Signorina!"

Gaspare's voice was speaking outside the door. And now there came a firm knock. Vere turned round, rather startled. She had been very much absorbed by her colloquy.

"What is it, Gaspare?"

"Signorina, there's a boat coming in from Naples with Don Emilio in it."

"Don Emilio! He's come back! Oh!" There was a pause. Then she cried out, "Capitani! Capitani!"

She ran to the door and opened it.

"Just think of Don Emilio's being back already, Gaspare. But madre! She will be sorry."

"Signorina?"

"Why? What's the matter?"

"Are you coming like that?"

"What? Oh, you mean my hair?"

"No, signorina."

"Gaspare, you ought to have been a lady's maid! Go and bring in Don Emilio in madre's room. And—wait—you're not to tell him madre is away. Now mind!"

"Va bene, signorina."

He went away.

"Shall I put up my hair?"

Vere went again to the glass, and stood considering herself.

"For Monsieur Emilio! No, it's too absurd! Gaspare really is—"

"I sha'n't!"

And she ran out just as she was to meet Artola.

CHAPTER XI

WHEN she reached her mother's sitting-room Artola was already there speaking to Gaspare by a window. He turned rather quickly as Vere came in, and exclaimed:

"Oh! she cried. 'Gaspare hasn't gone!'"

A look almost of dread, half pretence, but with some reality in it too, came into her face.

"Gaspare, forgive me! I was in such a hurry. And it is only Don Emilio!"

Her voice was coaxing. Gaspare looked at his padronina with an attempt at repudiation; but his nose twitched, and though he tried to compress his lips they began to stretch themselves in a smile.

"Signorina! Signorina!" he exclaimed, "Madonna!"

On that exclamation he went out, trying to make his back look comical.

"Only Don Emilio!" Artola repeated.

Vere went to him, and took and held his hand for a moment.

"Yes—only! That's my little compliment. Madre would say

* Begun in HARRIS'S WEEKLY No. 2753

Copyright, 1907, by HARPER & BROTHERS

of you, 'He's such an old shoe!' Such compliments come from the heart, you know."

She still held his hand.

"I should have to put my hair up for anybody else. And Giuseppe wanted me to for you."

Artois was looking rather grave and tired. She noticed that now, and dropped his hand and moved towards a bell.

"Yes!" she said, "all alone with me—see a treat!"

"Isn't your mother in?"

"No. She's gone to Naples. I'm very, very sorry. Make the best of it, Monsieur Emile, for the sake of my honour proper. I said I was sorry—but that was only for you and madre."

Artois smiled.

"Is an old shoe a worthy object of gross flattery?" he said.

"Yes."

"Then—"

"Don't be cantankerous, and don't be subtle, because I've been bathing."

"I notice that."

"And I feel so calm and delicious. Tea, please, Giulia."

The plump, dark woman who had opened the door smiled and retreated.

"So calm and so delicious, Monsieur Emile, and as if I were outside of friendship from top to toe."

"The all-the-world feeling. I know."

He sat down rather heavily.

"You are tired. When did you come?"

"I arrived this morning. It was hot travelling, and I shared my compartment in the wagon-lit with a German gentleman very far advanced in several nervous ailments. Basta! Thank Heaven for this. Calm and delicious!"

His large, piercing eyes were fixed upon Vere.

"And about twelve," he added, "or twelve and a half."

"Is?"

"Yes, yes. I am not speaking of myself, though I believe I am a bit alone."

"I am a woman—practically."

"Practically!"

"Yes; isn't that the word people always put in when they mean 'that's a lie'?"

"You mean you aren't a woman? This afternoon I must agree with you."

"It's the sea! But just now, when you were coming, I was looking at myself in the glass and saying, 'You're a woman'—solemnly, you know, as if it was a dreadful truth."

Artois laid back down on a sofa. He leaned back now with his hands behind his head. He still looked at Vere, and as he did so, he heard the faint whimper of the sea.

"Child of nature," he said, "call yourself that. It covers any age, and it's blessedly true."

Giulia came in at this moment with tea. She smiled again broadly on Artois, and revived and returned his greeting with the comfortable and unembarrassed friendliness of the Italian race. As she went out she was still smiling.

"Aides to the German gentleman with the unsanctified ailments!" said Artois.

An almost boyish sensation of sheer happiness invaded him. It made him feel splendidly unsatisfied. And he felt for a moment, too, as if his intellect lay down to sleep.

"(ara Giulia!" he added, after a rapturous silence.

"What?"

"(arissima Giulia!"

"Yes, Giulia is—"

"They all are, and the island, and the house upon it, and this clear yellow tea, and this brown towel, and this butter from Lombardy. They all are."

"I believe you are feeling good all over, Monsieur Emile."

"San Giennaro knows I am."

He drank some tea and ate some toast, spreading the butter upon it with voluptuous deliberation.

"Then I'm sure he's pleased."

"Paris, hateful Paris!"

"Oh, but that's absurd. A person who feels good all over should not say that."

"You are right, Vere. But when are you not right? You ought always to wear your hair down, even ruffled, and always to have just been bathing."

"And you ought always to have just been travelling."

"It is true that a dreadful post can be a blessing as well as a curse. It is profoundly true. Why have I never realized that before?"

"If I am twelve and a half, I think you are about—about—"

"For the love of the sea make it under twenty, Vere."

"Nineteen, then."

"Were you going to make it under twenty?"

"Yes, I was."

"I don't believe you. Yes, I do, I do! You are an artist. You realize that truth is a question of feeling, not a question of fact."

You penetrate beneath the gray hairs as the promise never do. This latter is delicious! And to think that there have been moments when I have feared butter, when I have kept an eye upon a corpulent future. Give me some more, plenty more."

Vere stretched out her hand to the tea table, but it shook. She drew it back and burst into a peal of laughter.

"What are you laughing at?" said Artois, with bourgeois majesty.

"At you. What's the matter with you, Monsieur Emile? How can you be so foolish?"

She lay back in her chair, with her hair streaming about her, and her thin body quivered, as if the sense of fun within her were striving to break through its prison walls.

"This," said Artois, "is the sheer imperviousness. I venture to inquire for butter, and—"

"To inquire! One, two, three, four—five pats of butter right in front of you! And you inquire—"

Artois suddenly sent out a loud roar to join her childish trick.

The sea had swept away his previous sensation of fatigue, even the happy stolidity that had succeeded it for an instant. He felt full of life and gaiety, and a challenging mental activity. A similar challenging activity, he thought, shone in the eyes of the girl opposite to him.

"Thank God I can still be foolish!" he exclaimed. "And thank God that there are people in the world devoid of humor. My German friend was without humor. Only that fact enabled me to endure his prodigious collection of ailments. But for the best I might have even recoiled in them. He was asthmatic, without humor, dyspeptic, without humor. He had a bad cold in the head, without humor, and got up into the top berth with two rheumatic legs and a crick in the back, without humor. Had he seen the fun of himself the fun would have meant much less to me."

"You cruel person!"

"There is often cruelty in humor—perhaps not in yours, though, yet."

"Why do you say—yet, like that?"

"The hair is such a kindly veil that I doubt the existence of cruelty behind it."

He spoke with a sort of almost tender and paternal gentleness.

"I don't believe you could ever be really cruel, Monsieur Emile."

"Why not?"

"I think you are too intelligent."

"Why should that prevent me?"

"Isn't cruelty stupid, unimaginative?"

"Often. But it can be brilliant, artful, intellectual, full of imagination. It can be religious. It can be passionate. It can be splendid. It can be almost everything."

"Splendid!"

"Like Napoleon's cruelty to France. But why should I educate you in abominable knowledge?"

"Oh," said the girl, thrusting forward her firm little chin, "I have no faith in mere ignorance."

"Yet it does a great deal for those who are not ignorant."

"How?"

"It shows them how pretty, how beautiful even, sometimes, was the place from which they started for their journey through the world."

Vere was silent for a moment. The sparkle of fun had died out of her eyes, which had become dark with the steady flow of imagination. The strands of her thick hair, falling down on each side of her oval face, gave to it a whimsically medieval look, suggestive of legend. Her long-fingered, delicate, but strong little hands

With hands that were slightly trembling she gathered together her manuscripts

were clasped in her lap, and did not move. It was evident that she was thinking deeply.

"I believe I know," she said at last. "Yes, that was my thought, or almost."

"When?"

She hesitated, looking at him, not altogether doubtfully, but with a shadow of reserve, which might easily be fanned, gross deeper, or fade entirely away. He saw the resolve to speak come quietly into her mind.

"You know, Monsieur Emile, I love watching the sea," she said, rather slowly and carefully. "Especially at dawn, and in the evening before it is dark. And it always seems to me as if at dawn it is more heavenly than it is after the day has happened, though it is so very lovely then. And sometimes that line made me feel that our dawn is our most beautiful time—as if we were nearest the truth then. And, of course, that is when we are most ignorant, isn't it? So I suppose I have been thinking a little bit like you. Haven't I?"

She asked it earnestly. Artois had never heard her speak quite like this before, with a curious deliberation that was nevertheless without self-consciousness. Before he could answer she added, abruptly, as if correcting, or even almost condemning herself:

"I can put it much better than that. I have."

Artois leaned forward. Something, he did not quite know what, made him feel suddenly a deep interest in what Vere said—a strange curiosity even.

"You have put it much better!" he said.

Veré suddenly looked conscious. A faint wave of red went over her face and down to her small neck. Her hands moved and parted. She seemed half ashamed of something for a minute.

"Madre doesn't know," she murmured, as if she were giving him a reason for something. "It isn't interesting," she added. "Except, of course, to me."

Artois was watching her.

"I think you really want to tell me," he said now.

"Oh yes, in a way I do. I have been half wanting to for a long time—but only half."

"And now?"

She looked at him, but almost instantly looked down again, with a sort of shyness he had never seen in her before. And her eyes had been full of a strange and beautiful sensitiveness.

"Never mind, Vere," he said, quickly, obedient to those eyes, and responding to their delicate subtlety. "We all have our righteous secrets and should all respect the righteous secrets of others."

"Yes, I think we should. And I know you would be the very last, at least madre and you, to— I think I'm being rather absurd really."

The last words were said with a sudden change of tone to determination, as if Vere were taking herself to task. "I'm making a lot of almost nothing. You see, if I am a woman, as Gaspare is making out, I'm at any rate a very young one, am I not?"

"The youngest that exists."

As he said that Artois thought, "Mon Dieu! If the Marchesinos could only see her now!"

"If humor is cruel, Monsieur Emile," Vere continued, "you will laugh at me. For I am sure, if I tell you—and I know you are going to—you will think this fuss is as ridiculous as the German's cold in the head, and poor legs, and all. I wrote that about the sea."

She said the last sentence with a sort of childish defiance.

"Wait," said Artois. "Now I begin to understand."

"What?"

"All those hours spent in your room. Your mother thought you were reading."

"No," she said, still rather defiantly; "I've been writing that, and other things—about the sea."

"How? In prose?"

"No. That's the worst of it, I suppose."

And again the faint wave of color went over her face to her neck.

"Do you really feel so criminal? Then what ought I to feel?"

"You? Now that is really cruel!" she cried, getting up quickly, almost as if she meant to hurry away.

But she only stood there in front of him, near the window.

"Never mind!" she said. "Only you remember that madre tried. She has never said much about it to me, but now and then from just a word I know that she feels bad, that she wishes very much she could do something. Only the other day she said to me, 'We have the intellect, men, the vocabulary.' She was meaning that you had. She even told me—she said you something that I had asked her, and she said, 'I feel all the things that he can explain.' And there was something in her voice that hurt me—for her. And madre is so clever. Isn't she clever?"

"Yes."

"And if madre can't do things, you can imagine that I feel rather absurd now that I'm telling you."

"Yes, being just as you are, Vere, I can quite imagine that you do. But we can have sweet feelings of absurdity that only arise from something moral within us, a moral deficiency. How ever—would you like me to look at what you have been writing about the sea?"

"Yes, if you can do it quite seriously."

"I could not do it in any other way."

"Then—thank you."

She went out of the room, not without a sort of simple dignity that was utterly removed from conceit or pretentiousness.

What a strange end, this, to their meeting!

Vere was away several minutes, during which at first Artois

sat quite still, leaning back, with his great frame stretched out and his hands ever more behind his head. His intellect was certainly very much awake now, and he was setting a guard upon it, to watch it carefully, lest it should be ruthless, even with Vere. And was he not setting also another mind to watch, the softness of his nature, lest it should betray him into foolish kind words?

Yet, after a minute, he said to himself that he was wasting his time in both these proceedings. For Vere's eyes were surely a touchstone to discover honesty. There is something merciless in the purity of untroubled youth. What can it not divine at moments?

Artois poured out another cup of tea and drank it, considering the little funny situation. Vere and he with a secret from Hermosine shared between them? Vere submitting verses to him—judgment! He remembered Hermosine's half-concealed tragedy, which, of course, had been patent to him in its uttermost nakedness. Even Vere had guessed something of it. Do we ever really hide anything from every one? And yet each one breathes mystery too. The assertive man is the last of fools. Of that at least Artois felt certain.

If Vere should really have talent! He did not expect it, although he had said that there was intellectual force in the girl. There was intellectual force in Hermosine, but she could not create. And Vere! He smiled as he thought of her rush into the room with her hair streaming down, of her shrieks of laughter over his absurdity. But she was full of changes.

The door opened and Vere came in holding some manuscript in her hand, and had done up her hair while she had been away. When Artois saw that he heaved himself up from the sofa.

"I must smoke," he said.

"Oh yes. I'll get the Khali Targas."

"No. I must have a pipe. And you prefer that, I know."

"Generally, but—do you look dreadfully as if you meant business when you are smoking a pipe?"

"I do mean business now."

He took his pipe from his pocket, filled it, and lit it.

"Now then, Vere!" he said.

She came to sit down on the sofa.

He sat down beside her.

CHAPTER XII

More than an hour had passed. To Vere it had seemed like five minutes. Her cheeks were badly flushed. Her eyes shone. With hands that were slightly trembling she gathered together her manuscripts, and carefully arranged them in a neat packet and put a piece of ribbon round them, tying it in a little bow. Meanwhile Artois, standing up, was knocking the shreds of tobacco on of his pipe against the chimney-piece into his hand. He carried them over to the window, dropped them out, then stood for a minute looking at the smoking pipe.

"The evening rain is coming, Vere," he said, "bringing with it the wonder of this world."

"Yes."

He heard a soft sigh behind him, and turned round.

"Why was that? Has objection set in, then?"

"No, no."

"You know the Latin saying: 'Festina lente?' If you want to understand how slowly you must hasten, look at me."

He had been going to add, "Look at these gray hairs," but he did not. And then he felt suddenly an inviolable reluctance to call Vere's attention to the signs of age apparent in him.

"I spoke to you about the admirable invention of ambition," he continued, after a moment. "But you must understand that I meant the ambition for perfection, not at all the ambition for celebrity. The satisfaction of the former may be a deep and exquisite joy—the partial satisfaction, for I suppose it can never be anything more than that, but the satisfaction of the other will certainly be dead sea fruit—fruit of the sea unlike that brought up by Ruffo, without lasting savor, without any real value. One should never live for that."

The last words he spoke as if to himself, almost like a warning addressed to himself.

Did he believe I ever should? Vere said, quickly. "I never thought of such a thing."

"The thought will come, though, inevitably."

"How dreadful it must be to know so much about human nature as you do!"

"And yet how little I really know!"

There came up a distant cry from the sea. Vere started.

"There is music! Of course, Monsieur Emile, I don't want—

but you understand!"

She hurried out of the room, carrying the packet with her.

Artois felt that the girl was strangely excited. She was revealing more of herself to him, this little Vere whom he had known, and not known, ever since she had been a baby. The gradual revelation interested him intensely—so intensely that in him, too, there was excitement now. So many truths go to make up the whole round truth of every human soul. Hermosine saw some of these truths of Vere. Gaspare others, perhaps; he again others. And even Ruffo and the Marchesinos—he put the Marchesinos most definitely last—even they saw still other truths of Vere, he supposed.

To whom did she reveal the most? The mother ought to know most, and during the years of childhood had doubtless known most. But those years were nearly over. Certainly Vere was approaching, or was on, the threshold of the second period of her life.

(Continued on page 28.)

THE NUGGET

DRAWN BY FREDERICK RICHARDSON

A SPIRIT IN PRISON

(Continued from page 35.)

And she and he had a secret from Hermione. This secret was a very innocent one. Still, of course, it had the two attributes that belong to every secret: of drawing together those who share it, of setting apart from them those who know it not. And there was another secret, too, connected with it, and known only to Artois, the fact that the child, Vere, possessed the very small, but quite definite, beginnings, the seed, as it were, of something that had been denied to the mother, Hermione.

"Emile, you have come back! I am glad!"

Hermione came into the room with her eager manner and rather slow gait, holding out both her hands, her hot face and prominent eyes, showing forth with ardor the sincerity of her surprise and pleasure.

"Giuseppe told me. I nearly gave him a hug. You know his shy look when he has something delightful up his sleeve for one of his boys?"

She shook both his hands.

"And I had come back in such bad spirits! But now—"

"She took off her hat and put it on a table."

"Why were you in bad spirits, my friend?"

"I had been with Madame Allard, seeing something of the intense misery and wickedness of Naples. I have seen a girl—such a tragedy! What devil must come to her in these southern places! What hideous things they will do under the pretence of being driven by love! But—no, don't let us spoil your arrival. Where is Vere? I thought she was entertaining you."

"We have been having tea together. She has this moment gone out of the room."

"Oh!"

She seemed to expect some further explanation. As he gave none she sat down.

"Wasn't she very surprised to see you?"

"I think she was. She had just been bathing, and came running in with her hair all about her, looking like an Undine with a dash of Scyllian blood in her. Here she is!"

"Are you pleased, madre? You poor, old madre!"

Vere sat down by her mother and put one arm round her. Subtly she was trying to make up to her mother for the little secret she was keeping from her for a time.

"Are you very, very pleased?"

"Yes, I think I am."

"Think! You mischievous madre!"

Hermione laughed.

"But I feel almost jealous of you two sitting here in the cool, and having a quiet tea and a lovely talk while—Never mind. Here is my tea. And there's another thing! Oh, Emile, I do wish I had known you would arrive to-day."

"Why specially?"

"I've committed no unusual crime. I've made—actually—an engagement for this evening."

Artois and Vere held up their hands in exaggerated surprise.

"Are you mad, my dear Hermione?" asked Artois.

"I believe I am. It's dangerous to go to Naples. I met a young man."

"The Marchesino!" cried Vere. "The Marchesino! I see him in your eye, madre."

"C'est cela!" said Artois, "and you mean to say—"

"That I accepted an invitation to dine with him to-night, at nine, at the Scoglio di Frisco. There! Why did I? I have no idea. I was hot from a horrible violence. He was cool from the sea. What chance had I against him? And, then, he is thorough and through Neapolitan, and gives no quarter to a woman, even when she is 'nona vecchia.'"

As she finished, Hermione broke into a laugh, evidently at some recollection.

"Doro made his eyes very round. I can see that," said Artois.

"Like this!" cried Vere.

And suddenly there appeared in her face a reminiscence of the face of the Marchesino.

"Vere, you must not! Some day you will do it by accident when he is here."

"Is he coming here?"

"In a launch at five to-morrow."

"Am I invited?" said Vere. "What fun!"

"I could not get out of it," Hermione said in Artois. "But now I insist on your staying here till the Marchesino comes. Then he will ask you, and we shall be a quartette."

"I will stay," said Artois, with a sudden return of his authoritative manner.

"It seems that I am woefully ignorant of the bay," continued Hermione. "I have never dined at Frisco's. Everybody goes there at least once. Everybody has been there. Emperors, kings, queens, writers, sages, politicians, generals—they all eat fish at Frisco's."

"It's true."

"You have done it?"

"Yes. The pudrine is worth knowing. He—had to-night you will know him. Yes, Frisco's is characteristic. Vere will be amused."

With a light tone he hid a faint chagrin.

"What fun?" repeated Vere. "If I had diamonds I should put them on."

She, too, was hiding something, one sentiment with another very different. But her countenance to her aid, and very soon the second excitement really took the place of the first, and she was passionately alive to the prospect of a novel party.

"I must not eat anything more," said Hermione. "I believe the Marchesino is ordering something marvellous for us, all the

treasures of the sea. We must be up to the mark. He really is a good fellow."

"Yes," said Artois. "He is. I have a genuine liking for him."

He said it with obvious sincerity.

"I am going," said Vere. "I must think about clothes. And I must undo my hair again and get Maria to dry it thoroughly, or I shall look frightful."

She went out quickly, her eyes sparkling.

"Vere is delighted," said Hermione.

"Yes, indeed she is."

"And you are not. Would you rather avoid the Marchesino to-night, Emile, and not come with us? Perhaps I am selfish. I would so very much rather have you with us."

"If Doro asks me I shall certainly come. It's true that I wish you were not engaged to-night—I should have enjoyed a quiet evening here. But we shall have many quiet, happy evenings together this summer, I hope."

"I wonder if we shall!" said Hermione, slowly.

"You—why?"

"I don't know. Oh, I am absurd, probably. One knows such strange ideas, houses based on sand or on air or perhaps on nothing at all."

She got up, went to her writing table, opened a drawer, and took out of it a letter.

"Emile," she said, coming back to him with it in her hand, "would you like to explain this to me?"

"What is it?"

"The letter I found from you when I came back from Capri."

"But does it need explanation?"

"It seemed to me as if it did. Read it and see."

He took it from her, opened it, and read it.

"Well?" he said.

"Isn't the real meaning between the lines?"

"If it is, cannot you decipher it?"

"I don't know. I don't think so. Somehow it depressed me. Perhaps it was my mood just then. Was it?"

"Perhaps it was merely mine."

"But why—I feel specially this summer I should like to be near you? What does that mean exactly?"

"I did feel that."

"Why?"

"I don't think I can tell you now. I am not sure that I could even have told you at the time I wrote that letter."

She took it from him and put it away again in the drawer.

"Perhaps we shall both know later on," she said, quietly. "I believe we shall."

He did not say anything.

"I saw that boy, Ruffo, this afternoon," she said, after a moment of silence.

"Did you?" said Artois, with a change of tone, a greater animation.

"I forgot to ask Vere about him. I suppose he has been to the island again while I have been away."

"Not once. Poor boy, I find he has been ill. He has had fever. He was out to-day for the first time after it. We met him close to Mergellina. He was in a boat, but he looked very thin and pulled down. He seemed so delighted to see me. I was quite touched."

"Did Vere been wondering very much why he did not come again?"

"She has never once mentioned him. Vere is a strange child sometimes."

"But you—haven't you spoken of him to her?"

"No, I don't think so."

"Vere's silence made you silent?"

"I suppose so. I must tell her. She likes the boy very much."

"What is it that attracts her to this boy, do you think?"

The question was ordinary enough, but there was a peculiar intonation in Artois's voice as he asked it, an intonation that awakened surprise in Hermione.

"I don't know. He is an attractive boy."

"You think so, too?"

"Why, yes. What do you mean, Emile?"

"I was only wondering. The sea breeds a great many boys like Ruffo, you know. But they don't all get Khalil Targis cigarettes given to them for all that."

"That's true. I have never seen Vere pay any particular attention to the fishermen who come to the island. In a way, she loves them all because they belong to the sea; she loves them as a diver. But Ruffo is different. I felt it myself."

"Did you?"

He looked at her, then looked out of the window and pulled his beard slowly.

"Yes. In my case, perhaps, the interest was roused partly by what Vere told me. The boy is a Neapolitan, you see, and just Vere's age."

"Vere's interest perhaps comes from the same reason."

"Very likely it does."

Hermione spoke the last words without conviction. Perhaps they both felt that they were not talking very frankly—were not expressing their thoughts to each other with their accustomed sincerity. At any rate, Artois suddenly introduced another topic of conversation, the reason of his hurried visit to Paris, and for the next hour they discussed literary affairs with a gradually increasing vivacity and open-heartedness. The little difficulty between them—of which both had been sensitive and fully conscious—passed away, and when at length Hermione got up to go to her bed room and change her dress for the evening there was no cloud

When Hermione had gone Artois took up a book, but he sat till

the evening was falling and Ghalia came sailing to light the lamp, without reading a word of it. Her entry roused him from his reverie, and he took out his watch. It was already past eight. The Marchese would soon be coming. And then—the dinner at Frisio's!

He got up and moved about the room, picking up a book here and there, glancing at some pages, then putting it down. He felt restless and uneasy.

"I am tired from the journey," he thought. "Or—I wonder what the weather is this evening. The heat seems to have become sultrier since Hermione went away."

He went to one of the windows and looked out. Twilight was stealing over the sea, which was no calm that it resembled a large sheet of steel. The sky over the island was clear. He turned and went to the opposite window. Above Lachia there was a great blackness like a pull. He stood looking at it for some minutes. His erring thoughts, which wandered like things estranged that cannot rest, went to a mountain village in Sicily, through which he had once ridden at night during a terrific thunderstorm. In a sudden, fierce glare of lightning he had seen upon the great door of a great palace, which looked abandoned, a giant black cloth. Above it were the words, "Lutto in famiglia."

That was years ago. Yet now, he saw again the palace door, the strip of cloth smoldering by the pouring rain, the dreary, almost sinister words which he had read by lightning:

"Lutto in famiglia."

He repeated them as he gazed at the blackness above Lachia.

To Be Continued.

Building Note in 1923

In order to complete the 410th story of the Skyscraper Building, the contractors will have to raise the sky three or four feet.

Our Great-grandchildren's Coal

THE question of the exhaustion of the coal supply in the United States is not one which can affect the present generation or its heirs. Yet the American supply is likely to be exhausted before that of Europe, and particularly before that of Great Britain. Looking at the matter from the point of view of national providence or prudence, covering generations and generations, America should, beyond doubt, be a little saving of its coal.

It has been estimated that Pennsylvania has about enough anthracite coal to last, at the rate of production that prevailed last year, a little less than two hundred years. Probably the supply will be exhausted somewhat sooner than that, unless some profitable substitutes in found for anthracite. As to bituminous coal in the United States, the supply is very great and widespread. It is estimated that it will last, at the rate of consumption which prevailed during the last decade, something less than four hundred and fifty years.

If the coal supply of the world at large were likely to be exhausted in any such way as to make a considerable drain on the American supply for foreign consumption, the situation might be regarded as alarming if we could put ourselves in the place of our great-grandchildren. But there is not likely to be such a time when we shall have to "feed the world" with coal.

In 1880 Great Britain had "in sight," so to speak—although it was all below the ground—an available coal deposit estimated at nearly 145,000,000,000 tons. At the rate of production and consumption then prevailing the supply would last for about 5000 years. The coal measures of Lancashire are 8000 feet in thickness.

Moreover, there are many countries which possess coal deposits that have never been touched. Besides the great coal-fields of Europe and America as now worked there are undoubtedly coal deposits in China, in the Philippines, in Australia, in South America, in British North America, in Alaska, in the Indian Archipelago, and elsewhere.

With one circumstance the American people, looking at the matter from the consumer's standpoint, may well be pleased. Europe does not want our anthracite coal—the best fuel, on the whole, that the earth has ever produced. Europe does not understand the use of anthracite, and is apparently not willing to learn it. It calls on us for bituminous coal, which we can spare more readily.

The assumption that the coal fields of Great Britain and America will be exhausted even at the end of several centuries is founded on the further assumption that heat will continue to be made and power generated in the future much as they are made and power generated now. But our inventors and chemists hold out the assurance that great changes may be looked for in the methods of producing heat and mechanical energy.

Quaint Drinking Games

DISASTROUS bouts have been accompanied among all peoples by curious diversions. *Catobas* is the most classical, having been in vogue over most parts of the ancient world. The player lay on a couch, and without moving his position attempted to draw from his goblet a few drops of wine at a mark, in a high curve, without spilling any of the liquor. The mark consisted generally of a little image of Hermes, placed on a bronze-saucer, which sometimes floated on water, so that until it was filled by a sufficient quantity of wine to sink it, the game continued. To play *catobas* well was a mark of good breeding in Athens.

More widespread is the game *winos*, which is still played in Italy, but is described by native writers of China, where it also appears to have originated spontaneously. One of the players suddenly stretches out one or both hands, with certain fingers extended; his opponent must immediately guess the number, under penalty of paying for the drinks.

At certain colleges in the English universities a fearful penalty is attached to the making of a pun during the dinner of which undergraduates usually partake in common with the faculty in the hall. The pun is referred to the dean, and, if denounced by him, the author is required either to empty at once a quart of ale, or to supply drinks to all the auditors.

In medieval England "drinking to pegs" was prevalent. Wooden pegs were inserted at regular intervals into the sides of tankards, to regulate (sometimes by statutory enactment) the amount to be partaken of. The inhibition of more than the prescribed quantity was punished in the usual way, by a forfeit of drinks all round.

"Up-Jinkins" is still played in English bar-rooms. A sixpence is concealed beneath the hands of two or more confederates, who, at the command of their opponents, bring their hands sharply down upon the table. Second the hand which holds the sixpence be guessed correctly, the coin in question is devoted to liquid refreshment.

The Unlucky "Quarter"

THOSE who believe that thirteen is an unlucky number should find that of a quarter-dollar, for it has thirteen stars, thirteen letters in the small hole in the eagle's beak, thirteen marginal feathers on each wing, thirteen hairs in the shield, thirteen horizontal bars, thirteen arrow-heads, and thirteen letters in its name. Who would have a quarter?

Forestry in France

FRANCE has given to the world many valuable lessons in forestry, especially in the reclamation of sand dunes and swamps by the department of the Landes in the southwest, and the high returns from the cultivation of pines there.

Comprising about two and a half million acres of what were barren sand dunes prior to 1803, this area has been reclaimed by forest planting until it has become one of the most productive and profitable regions of the republic. The subsoil drainage of the

country has been effected by the roots of the trees, which penetrate the layer of clay that underlies the sand dunes.

In addition to supplying timber this area supports a number of industries dependent on the cultivation of the pine, including the production of turpentine, resin, tar, pitch, charcoal, and other products of similar nature.

In the system by which the forest is managed the trees are divided into two classes: the "short life" trees and the "standing" trees. The former are tapped as soon as they are big enough to endure "bleeding"—that is to say, when about four or five inches in diameter. When they have been bled to death they are removed as "thinings," the wood being used for pit props, for which the English demand guarantees a steady and profitable market. The second class, composed of the most vigorous individuals, are not tapped until they are from ten to fifteen inches in diameter. The age of these trees when they are felled is from fifty to sixty years. The timber is used for lumber poles and railway ties.

Of these forests, about eighty per cent. belongs to individuals, while from the 125,000 acres belonging to the government there was obtained as revenue in 1903, \$28,841, as against \$640 in 1883, the first year in which any revenue was obtained at all.

Wheels

He was a great inventor. "The thing I am working at now," he began, striking his big hand with a thinner hand, "will be a boon to every family and will startle the whole world. In fact, it will put the Alarm Clock Trust out of business. The idea is simply absolutely prepared tablets that help you get up in the morning. For instance, if you want to arise at five you take five tablets; if you want to get up at six take six tablets; and so on."

"But how will it affect the Alarm Clock Trust?"

"Why, these tablets will cause a ringing in the ears at exactly the hour desired."

But the little crowd could wait to hear no more and hurriedly disbanded.

THREE GENERATIONS OF HEALTHY BABIES

have been successfully reared on Borden's Eagle Brand Condensed Milk. "I never saw any other all-so-called 'infant foods' so thoroughly recommended by physicians and so widely known to the mothers of healthy babies."

THE BEST FOOD FOR INFANTS FOR CHILDREN ARE BORDEN'S VERMILION CUPSETS 22 cents a box, 4 for \$1.00.

ADVERTISEMENTS.

Pears'

Pears' is essentially a toilet soap. A soap good for clothes won't benefit face and hands. Don't use laundry soap for toilet or bath. That is, if you value clear skin.

Pears' is pure soap and matchless for the complexion.

The Evolution of Food

WHAT would be the sensations of one of our ancestors of the middle ages if he could sit down to a modern breakfast table?

To begin with fruits, these were almost unknown to the men of his period; certainly in their present form. So were most of our vegetables. The only vegetable which seems to be more or less indigenous over the greater part of the world is the squash-pumpkin tribe. The pumpkin is very ancient, for it dates back to India.

Of course he knew the small wild cherry, with its bitter flavor, the little wild straw-berry, the raspberry, blackberry, and plum. Apples, or "crabs," as Shakespeare calls them, were used in England, and generally roasted in order to deprive them of their astringency. The wild hedge orange of China and India filtered into Europe occasionally, but it was scarcely eatable. Nut-trees were, of course, unknown. Bananas were introduced in quantity to Europe with in the lifetime of many middle-aged men. The grapefruit is the product of the past two decades, and even yet has sedate cronies on the Atlantic. The peach was a poisonous shrub in Persia.

Strangely enough, it was the lack of fruit which led to the discovery of Asia. In those days, when salt fish was the usual diet of all nations, pepper became a luxury. Pepper plays a disproportionate part in history. Who speaks and sings of spices nowadays, when they can be procured at every grocer's store? Yet it was to obtain pepper that the East India Company was chartered during the reign of Elizabeth.

But were delicate scrumptious by Doctor Johnson as a food fed to men in Scotland and to horses in England. What would the worthy Doctor have thought of our very modern breakfast foods—the flakes, the lumps, the buns, the sherries, and various constituents of grains? Tea, coffee, and cream were, of course, unknown until the beginning of the eighteenth century. Sugar was the most costly of condiments. Bee-keeping was the practice of every farmer.

Our worthy ancestor broke his fast upon salt fish, or meat if he were wealthy or had access to some deer forest. He washed down his food with hot beer, ale, or honey brew. A roasted crab-apple "sang in the land" on the very numerous Saints' days, the modern breakfast would startle our ancestor very much indeed.

DE SCULLE. "They have moving pictures of Taft now."

GILBERT. "It would be more wonderful if they could get a picture of him not moving."

Indian Art in Calcutta

AN exhibition of modern and ancient Oriental paintings has just been held at the Indian Government School of Art in Calcutta, and attracted considerable attention. The pictures were in both oil and water colors, and the greater part of them were loaned for the purpose of the exhibit by Indian residents of Calcutta. The School of Oriental Art is making a strong effort to revive the interest in genuine Oriental art, which in India is rapidly disappearing. A prominent leader in the movement says that he is hopeful of success, and believes that India will again become a potential inkstand in lifting the tapers to a higher level.

The ancient Indian pictures in oil were of unusual interest, and attracted the attention of the lovers of old pictures and students of local color. There was an interesting exhibit of Chinese and Japanese paintings, some of them quite old, which were owned by Indian families of wealth and culture. The exhibition was the first of its kind to be held in Calcutta.

THREE DAYS' TRIAL

Health Merry-Go-Round

To see it is to see it—the delightful recreation of a father for his delicate child. The Health Merry-Go-Round is a veritable La Jolla of health and merriment—with a real sense that will play into your

The children do the preceding with an easy forward and backward swing that easily carries every member, develops the lungs, braces the back, and strengthens the limbs. It gives the motion of rowing without the danger of a row, induces men to the church, makes appetites grow, keeps the little folks near from the dust and perils of the street, enables mother to keep all company for little ones, and leaves mother there popular with their parents. (Part for small boys and in more words.) Each Health Merry-Go-Round has four comfortable seats.

Not a day but a few days—in will be for you. Built substantially of iron, steel and aluminum. Hand-cranked, painted in light and red. Comes with three sets of chairs, and some may be had and time—a good-sized instrument. (Personal) ranges in price from \$10.00 to \$20.00. Each Health Merry-Go-Round has four comfortable seats.

A father's recreation for his child. Philadelphia edition: every one's approval of it. The price for an excellent article is extremely low. We have arranged for you to see and try it.

Government Factories for Preserving Wood

Timbers thoroughly treated with proper preservatives will last almost indefinitely. But up to the present time complicated and expensive plants have been necessary for the work, and wood preservation has often been too expensive an operation to allow treated timber to come into general use.

Methods in wood preservation have undergone a marked change in the last few years, however, and the work which, a few years ago, was limited to a few experiments carried on in scattered parts of the United States, has grown with such rapidity that wood preservation has become a business which figures most prominently in the industrial life of this country.

Each year railroads are preserving an increasing portion of their cross ties, millers their mill props, farmers their fence posts, and the men of many other industries are bringing preservatives into play to close the pores and to conserve the lumber that they use against the fungi that cause decay.

In nearly all localities in the Rocky Mountain and Pacific States is found an abundant supply of certain kinds of timber that have only a slight commercial importance, Engelmann spruce, lodgepole, and other kinds of pine, aspen, and cottonwood are only a partial list of the kinds of wood that are strong enough and abundant enough to win high value for construction purposes, but when exposed to the soil and weather decay so rapidly that they have to be renewed so often to justify their use. Therefore, before they can successfully compete with Douglas fir, Oregon cedar, and the woods used so extensively in construction work, they must be made to last longer under unfavorable conditions.

After several years' study, the United States Forest Service has proved that in many cases complicated and expensive plants are not necessary for the proper treatment of many kinds of timber, and that many of the timbers that decay most rapidly in the natural state are among the easiest and cheapest to treat. Many of the species mentioned above offer little resistance to the entrance of the preservative. The principle of the method is to immerse the thoroughly seasoned wood in a hot bath of the liquid, leave it in for a few hours, and then either plunge it into a cold preservative bath, or else run out the hot liquid from the treating tank and fill it up again with liquid of a lower temperature. This requires only the simplest kind of machinery, and the cost of operation is so slight that even cheap shanties such as fence posts and shingles can be treated by the average farmer of small means.

In order to demonstrate beyond any doubt that the process is adapted to commercial treatment, the service has arranged to erect small treating plants, semi-commercial in size, on several of the national forests. Three such plants will be erected this spring, and it is expected that they will be in successful operation by early summer. According to the present plans one plant will be erected at some locality on or near the Black Hills National Forest, South Dakota; another on the Holy Cross National Forest in Colorado; and the third on the Henry's Lake National Forest, near St. Anthony, Idaho.

The Eye-witness

A very good story has recently been told in the fleet of an incident which happened when Admiral Evans was in command of the *Redoubt*. An old-time bluejacket was at the mast, before Captain Evans, charged with getting food out of a mess chest outside of meal hours. This getting of food for night watches is a common and strong desire on the part of most men aboard ship.

Captain Evans asked the man what he had to say, and the man, sizing up the delicate situation, said:

"Captain, I didn't take no food outler that chest. Why, Captain, there weren't no food in that chest! I looked in that chest, and, cap'n, I met a cockroach coming out of that chest with tears in his eyes."

YOUR SUMMER PLAYGROUND?

Half the enjoyment of the summer vacation depends on the choice of the right place. There's a right place for everybody. You will find it described in the 1908 Summer Book of the Lackawanna Railroad, entitled

"MOUNTAIN AND LAKE RESORTS"

a beautifully illustrated book of 112 pages and a practical guide to the best places for fishing, hunting, golfing, motoring, climbing, sailing, swimming or any other sport or recreation. The book will tell you the one best place to go to, the right way to go, and the best place to stay. It gives list of hotels, camps, railroad fares, etc.

Send your address and the book will be mailed to you.

The Ideal Year-Round Resort

For Rest and Recuperation Should Combine

The Chamberlin is conducted on the American plan

Single room, one person, \$5.00 per day;
\$5.00 per week.

Double room, two persons, \$9.00 per day;
\$9.00 per week.

Single rooms with bath, one person, \$6.00 to
\$8.00 per day; \$45.00 to \$50.00 per week.

Double rooms with bath, two persons, \$13.00
to \$15.00 per day; \$75.00 to \$100.00 per
week.

Ease of Access, Equable Climate, Invigorating Air, Interesting Surroundings, Correct Sanitation, Pure Food and above all Perfect Hotel Accommodations

A rare combination indeed, and to be found in but one place in America—

Hotel Chamberlin
At Old Point Comfort

The Baths and Sea-pool

of the Chamberlin are the finest in America. The pool, 40 by 70 feet, is of Ceramic Mosaic Tile, so perfectly ventilated and radiant with sunlight that you are really bathing out of doors. Filtered sea-water is constantly flowing in, and the air and water are always at an agreeable temperature. A competent swimming-master is in attendance.

The Hydrotherapeutic Department

is complete in every detail, medical baths of every size—Nautilus baths, electric, electric, massage and steam-baths, and Dr. Baruch's system. A most unique feature of our bathing is our outdoor pool, fresh sea-water in many of them, thus adding to the medicinal benefits the very marked benefits to be derived from the salt of the sea. These are particularly recommended for Rheumatism, Nervousness, Rheumatism, Gout and kindred disorders.

Our resident physician is an expert in hydrotherapy, and his bath is given by his advice and under his direction. A special booklet on Baths and Bathing may be had at any of the above offices, or address

A NOTABLE BIOGRAPHY

The Life of
CHARLES A. DANA

By Gen. James Harrison Wilson

"The most readable biography that I have had in my hand for many a day. Dana was one of those unseen forces that are so potent in this world, and the author has made very clear how important his relation has been to the history of our time."—JUDGE GEORGE GRAY.

"I have read *The Life of Charles A. Dana* from beginning to end with lively and increasing interest. . . . The two hundred pages, 182-183, struck me as a veritable contribution to the history of the War of Secession. . . . The author throws from time to time a searchlight into the true inwardness of situations."

—CHARLES FRANCIS ADAMS.
 "I congratulate you upon the book as a literary triumph."—Gen. EDWARD H. RIPLEY.

"Of extraordinary interest and wonderfully well done. I can imagine no one beginning it and laying it down."

A Dozen
Histories
in One

The American Nation A History

To the reader:

This is an entirely new history of our country, now complete, and issued after seven years of labor.

This is the only history dealing with every field of our national life. Our political, economic, religious, industrial, financial, and social life is set forth side by side and in their relation one with another.

The careful selection of authors who could write brilliantly as well as with scholarship and insight has made it possible to carry this story of America through volume after volume with the glow and spirit of romance. It is, above all—interesting.

Any one of the "Fifty Facts" given here will interest you. The entire fifty will astonish you. The work itself is of such distinction and magnitude that you owe it to yourself to learn about it, whether or not you ever purchase this or any other history of America.

Harper & Brothers have published books for 91 years. They consider "The American Nation: A History" their most important work.

"The American Nation: A History" is of a size to match the magnitude of its subject—twenty-seven handsome library volumes. These volumes are crown octavo, and in two styles of binding: (1) Red polished buckram, stamped in gold, with dark-blue leather labels; (2) Persian half-morocco of a rich crimson, stamped in gold, with cloth sides and special end-papers. Gilt tops, untrimmed edges, head-bands, etc., with each style of binding. Typography, press-work, and binding are as near perfection as modern book-making can go. It will be sold only in complete sets—twenty-seven volumes.

Gentlemen—

Please mail to me, absolutely without cost, your 32-page booklet describing "The American Nation: A History," with sample pages, maps, illustrations, etc.

Name.....

Business Address.....

Fifty Facts

1. Twenty-seven volumes with complete working index.
2. Seven years in the making.
3. The work of authors—scholars from twenty universities.
4. The cooperation of four state historical societies.
5. Material from the original sources.
6. Written by twenty-four historical specialists.
7. Edited by Albert Bushnell Hart, Ph.D., LL.D., Professor of History, Harvard University.
8. An entirely new work.
9. Every field of national life treated by a specialist.
10. Original maps—(56 in number)—beautifully executed in colors.
11. The first and only existing American Historical Atlas.
12. Unique series of maps of different periods.
13. Photographic frontispiece on Japan placed in each volume.
14. A gallery of portraits of leading figures in American History.
15. The idea—a great public need for such a work.
16. The fruit of consultations between historians, publicists, and societies.
17. Every author a master in his field.
18. A definitive History of America.
19. A genuine Historiography of America.
20. Disputed historical questions compared with their original sources.
21. Citations and footnotes for collateral reading.
22. The combined strength of co-operation by specialists.
23. It stands the double test of accuracy and maintainance.
24. Many documents never before published.
25. The lifetime research of many authorities.
26. A History, a Biography, a Geography of everything American.
27. A separate preface to each volume by the editor.
28. Each volume complete in itself.
29. The twenty-seven volumes fused into a connected narrative.
30. Bibliographies and indexes in each volume.
31. Absolutely up to date.
32. A brilliant story as well as a veracious historical record.
33. Unexcelled in style throughout.
34. Equally valuable for instruction, reference, and general reading.
35. The first American History by a body of trained specialists.
36. Pioneering scholarship on every page.
37. The mistakes of other works carefully avoided.
38. A record of labor movements and industrial conditions.
39. An illuminating Political History.
40. The school, literary, and scientific life of the nation.
41. The social and community development.
42. Financial growth and history.
43. The religious life impartially treated.
44. The only American History that truthfully can be called great.
45. Great personages delineated in striking word portraits.
46. Great events recounted with the thrilling interest of fiction.
47. Great movements described with their causes and effects.
48. Great crises pictured without malice or prejudice.
49. Mechanically a perfect piece of book-making.
50. A standard work of value for all time.

STORIES OF SYMPHONIC MUSIC

A Guide to Modern Orchestral Programme-Music

By **LAWRENCE GILMAN**

Music Critic of "Harper's Weekly"

This book fills a genuine need of the music-lover, for it offers in compact, accessible, and easily intelligible form information which will help him to listen understandingly to the music of an orchestral concert. It presents clearly and without technical analysis the poetic or pictorial or dramatic basis of every important example of programme-music in the symphonic repertoire, putting the reader in possession of information which will enable him to listen comprehensively, for example, to a symphony by Berlioz, an overture by Mendelssohn, a symphonic poem by Liszt, or a tone-poem by Strauss or Debussy.

"The best thing for every connoisseur to do is to get a copy of Mr. Gilman's book and give him himself his hands."—*N. Y. Evening Post*

"From Beethoven and Liszt and Riff and Wagner down to the latest works of Strauss, Mahler, Debussy, Schoenberg, Hindemith, Kefer, Reger, Chabrier, and Copland, with many others, that will occur to concert-goers, Mr. Gilman has left nothing that has any claim to the attention of music-lovers. . . . It is a useful and interesting book."—*The New Music Review*

"A valuable contribution to the music-lover's library."—*Chicago Post*

HARPER'S WEEKLY for NEXT WEEK

THE PRESIDENTIAL SKIRMISH LINE

Is the title of a notable two-part article in which Frederick Boyd Stevenson will consider impartially the personalities and the tactical strength of the men who are in the vanguard of the columns now advancing upon the national conventions.

Read this absorbing article if you wish to be informed concerning the latest developments of the political situation.

THE PRINCIPLES OF MONEY AND BANKING

By **CHARLES A. CONANT**

In the demand for literature on financial subjects, this work deserves special consideration. A chapter of the second volume is specially devoted to "The Origins of Crises," in which much is set forth that anticipates present conditions. Another chapter, on "The Management of Crises," anticipates the recent steps taken by the banks and the Treasury to afford relief to the money market.

This book was among the first to point out the danger of making large loans on securities pushed upward by speculation to inflated values.

COMMENT

The New York Democratic Convention

IN so far as the Democratic State convention in New York declared for an instructed delegation to Denver it acted unquestionably in accordance with the sentiments of a large majority of the Democratic voters of the State. New York is not for BRYAN. Everybody knows that. There were BRYAN men at the convention, but not many. They were far outvoted. All the masters and most of the men of the convention were opposed to instructions. The deposition of McCORMACK as representative boss of Brooklyn and the rejection of his delegates was an exploit of a species not without precedent in political conventions, where the good old rule is apt to suffice—

That they should take who have the power,
 And they should keep who can.

It angered McCORMACK and his friends to be cast out, but it did not seem to be seriously revolting to the convention's sense of propriety. The arrogant act that did outrage the sensibilities of a serious proportion of the delegates was the rushing through of a resolution empowering the State Committee to complete its own membership. The custom has been for the delegates from each Senatorial district to name the State committeemen. The resolution aforesaid in effect abolished the custom, and peremptorily lodged the selection of the State Committee in the hands of CHARLES MURPHY and WILLIAM J. CONYERS. They exercised their powers forthwith by turning out the committeemen who were opposed to them, and filling their places with persons who knew how to take orders, thus making the committee abjectly harmonious. In so doing they made trouble, and the convention broke up in tumult, epithets, and menaces, leaving MURPHY and CONYERS in complete control of the Democratic organization in New York State. A remarkable brace of statesmen they are, especially CONYERS, and wonderful it is that they should control an organization with such a history, such traditions, and such an existing membership as the Democratic party in this State! Represent the party they do not, but it may be that they are fair representatives of the Democrats in this State who make a business of politics, work hard at it, and live by it. In the competition with these professionals, lawyers, doctors, judges, merchants, and other citizens who work at politics in their spare time do not make much of a figure.

Mr. Bryan's Divine Right Denied

Has somebody been saying, "Why don't you speak for yourself, JONES?" to Governor JOHNSON, or has he been misreported? An Omaha despatch which has circulated in the papers quotes him as brisily depreciating the assertion of the Commonwealth that the Pennsylvania delegation would be

instructed for BRYAN. "Entirely untrue," says Governor JOHNSON, and adds that there will be surprises for that Pennsylvania delegation when it gets to Denver, and that it will be found voting with New York. He went on to say:

Mr. BRYAN was for several years the "Grand Old Man" of the Democratic party, and many consider him as such yet, but how long this popularity will continue is a matter of conjecture. The signs of the times indicate an ominous and rocky future for him. I presume I ought to apologize for coming into Nebraska and saying these things, but to a man up a tree they certainly appear truthful.

This is a shocking defiance of Mr. BRYAN's divine right to the nomination if he wants it, and it has been a surprise to see such candid speech, attributed to Governor JOHNSON. Yet the report is at this writing still uncontradicted, and, after all, how can Governor JOHNSON take any interest in his own candidacy and not dispute Dr. BRYAN's divine right? There must be two sides to every game. In the game to be played at Denver there is no question on which side Mr. BRYAN is. He is against every candidate except BRYAN; against them all, heartily, for the nomination, and with the suggestion made in his behalf, though not by him, that not one of them, if nominated, can get a large enough proportion of the BRYAN vote to be elected.

Mr. Bryan's Example

Governor JOHNSON certainly makes a better appearance as a candidate opposed to Mr. BRYAN's candidacy, than as a candidate willing to take the nomination if Mr. BRYAN is willing to let him have it. Whether is not for BRYAN is against him, and might as well stand up and be counted. Mr. BRYAN sets the example, and it is a good one. He shows not the slightest compunction in showing whom he is for, and that he is against every one else.

The Spirit of the Times

What is SAMUEL GOMPERS' idea of the spirit of the times? In a speech the other night in New York, at a mass meeting called to impress upon Congress the expediency of amending the SHERMAN anti-trust law so as to cut the ground out from under the recent Supreme Court decisions against boycotting, Mr. GOMPERS said:

The Supreme Court calls us a trust, but, my friends, the Supreme Court is nothing more than a creation of the people—it is liable to err, and is consequently subject to the criticism of men.

I would resent any imputation that the highest court in the land was prompted by any sordid motives; but it is made up of men who were successful lawyers and jurists, and, as such, they are necessarily men whose training and environment are not in accord with the spirit of the times. A man in these days must show he is all right for vested interests before he can even become a lawyer, and later on, perhaps, a judge with power to pass on the rights of the great body of the people.

What is the spirit of the times with which Mr. GOMPERS finds the justices of the Supreme Court not in accord? They are not in accord with it, he says, because they have been successful lawyers and jurists, men who have shown that they were "all right for vested interests." Is the spirit of the times, then, opposed to "vested interests" (which means the rights of property), and opposed to having the laws interpreted by lawyers? Is it, as Mr. GOMPERS sees it, opposed to law altogether? Probably not. We don't suppose Mr. GOMPERS is an anarchist. No doubt he wants laws, but it would seem that they must be laws that will let his side lose and tie the other side up. But the lawyers' idea of law is something that will work both ways, and that undoubtedly is the notion that the Supreme Court has about it. The great purpose of law is to defend the weak against the strong, and to substitute rule and right for force. If the spirit of the time favors seizure of property by main strength by any one who has the strength and covets the property, then certainly the jurists of the Supreme Court are not in accord with it.

Keep the Laws

It is quite true that the court is human and liable to err, but Mr. GOMPERS's notion that because its members are lawyers it is committed to the defense of the rights of property and opposed to the rights of labor is ludicrously mistaken. It is committed to the defense of all rights and the defeat

of all wrongs; to the annulment of laws that are unconstitutional and the correction of laws that are unwise. The way it corrects unwise laws is by enforcing them. "We will obey the laws," says Mr. GOMPERS, "but when we find a law that does not permit progress under modern conditions, then we will see that the law is changed." There he is on firm ground. Provided he has votes enough behind him he can, in time, make what laws he will. And if the Supreme Court finds any of his laws to be unconstitutional, he can in time (if he has the votes) amend the Constitution to suit his voters or himself. And in time, too, if his voters stand by him, he or his successors can put whom they will on the bench to interpret the laws. It is a free country; the people have all the power there is, and can use it, subject to delays wisely contrived to further stability of government and protect liberty and property. Go ahead, Mr. GOMPERS; get the votes, and if you live long enough you can have everything your way, and square everything with the spirit of the times as you see it. But meanwhile obey the laws, thereby avoiding trouble, and setting an example that will be helpful to you in keeping order when you have won out and the laws have been changed to suit you. The railroads and the trusts obey the laws now. Follow their example. It is a good one.

Replacing the Blame

Instead of complaining that the justices of the Supreme Court are lawyers, Mr. GOMPERS might better grumble that more lawyers, or better ones, did not have a hand in drafting the SHERMAN law.

Exit the Aldrich Bill

The ALDRICH bill ceased a good while ago to be the bill that Mr. ALDRICH proposed. The chances of its passing in some amended form have been gradually fading, until at this writing its obituary notice has been sent out and accepted for publication. In its later hours, and as tinkered and retinkered, both in the Senate and the House, the banks lined up against it, and that finished it. The VARELAN bill, its successor, is now under the scrutiny of our legislators. One detail of it that recommends it to the bankers who opposed the ALDRICH bill is that it includes commercial paper at a basis for emergency currency. Mr. VARELAN insists that some provision to safeguard the business of the country against panic and the consequent locking up of currency should be made in the present session of Congress. In that he continues the effort begun by Mr. ALDRICH, and differs from Mr. FOWLER, who declares that a bill for the appointment of a currency commission is all that is needed at the present time. There the matter hangs at this writing. Though the ALDRICH bill seems to have failed, the discussion which it has provoked has been valuable, and the VARELAN bill may yet get the benefit of it. The importance of its purpose—to provide an emergency currency—is better recognized and better understood than ever; Congress is better qualified to accomplish it than it was two months ago, and may still accomplish something before it adjourns. If it does nothing else, it will doubtless appoint the commission to revise our present currency system, the defects of which have been effectually expounded in the ALDRICH bill debates.

Insurance Against War

It is a serious matter that, by a vote of 199 to 83, the four battleship programmes recommended by the President has been rejected by the House. Nobody wants to put a cent more than is necessary into battleships. They pay no direct dividends to their owners, and the value of the indirect profit on them in the protection and preservation of peace is apt to be less appreciated than it deserves. Battleships are insurance against war. They are very dear to build, unproductive when built, and very expensive to maintain. But all insurance is costly and unproductive. It would be an enormous economy if we could do away with the need of fire-insurance or even make a material reduction in the cost of it. The loss by fire last year in this country was about \$214,000,000; the insurance loss was \$128,000,000, and doubtless the cost of insurance was considerably more than that sum. Besides this cost of insurance premiums we must reckon as part of our fire-insurance bill the cost of maintenance of all the fire-apparatus and firemen in the country. Measured up against

our fire-insurance bill our war-insurance bill does not seem so big. Last year it was about \$200,000,000; about \$98,000,000 for the navy and \$102,000,000 for the army. It is, of course, a pity we have to pay so much. Whenever all the leading nations can agree to diminish the chances of war and carry less war insurance, we can and will join with them in doing so. But until there is such agreement it will be hard economy for us to save money on our war insurance. Congress is willing to vote two battleships and a couple of colliers, and to authorize naval expenditure of nearly \$108,000,000. That is by no means a miserly provision, but in the judgment of the experts it does not quite warrant us in feeling that as against the chances of war we are "fully insured."

Race-track Betting

Article II., Section 9, of the Constitution of the State of New York reads:

Nor shall any lottery or the sale of lottery tickets, pool-selling, bookmaking, or any other kind of gambling be authorized or allowed within this State, and the Legislature shall pass appropriate laws to prevent offenses against any of the provisions of this section.

Whatever meticulous members of the bench and bar may say it looks to us as if one duty at least this provision imposes upon the Legislature, namely, the passage of laws which will be, so far as it is possible to make them, appropriate to prevent every kind of gambling everywhere within the State. To be sure, it does not necessarily command the Legislature to penalize gambling in such a manner as to make it criminal; but no more does it privilege the same body to omit to prevent gambling in certain places when penalties can be imposed which will effect such prevention. To admit any such proposition would be to concede that what the Constitution says the Legislature must do the Legislature needn't do if it doesn't want to. In passing the FENCY-GRAY law our lawmakers partly fulfilled a constitutional obligation; when they pass the AGENE-HART bills, and not until then, will they have made good altogether. Whether the people wish them to make good altogether, whether it would be good for the people if they should, is quite another matter. Let us suppose that the majority of us would like to see gambling in this State exterminated. But this is impossible; all the law can do is to reduce the practice to a minimum. Now banish the bookmakers from the race-tracks; many of them would open up establishments in the cities, for they must live. Simultaneously most of the men who are forever proclaiming that horse-racing is the greatest sport on earth would nevertheless unaccountably lose interest in it and stay in town. In other words, gambling-houses and gamblers would become more numerous in the cities, although operating secretly for fear of the law. Under such conditions would not the number of young men who go wrong be greatly reduced? Possibly; for it is one thing to find a race-track and risk your money with impunity; another to find a house operating on the quiet and risk your money criminally. But what about the many working-men with families who have neither the time nor the money to get to a race-track, but who would be given more opportunities to risk their little all? Surely, whether the AGENE-HART bills ought to be passed is a question on which honest men may well differ.

Preserve the National Forests

A letter printed on another page calls attention to the neglect of Congress, so far, to take any action for the forests of the White Mountains and Southern Appalachians. No measure is more important to the permanent prosperity of the country than this one to which our correspondent, Mr. ROLLINS, calls attention.

The Results of an Attempt to Reform Old Age

If the demon Rum had continued to this day "chained to the burning lake," we doubt very much whether the sons of old ANAS would be any better off than they are. There have been always about so many of mankind who would have "had something" anyway. If Rum had been kept below, they would have fallen victims to his cousin demon, Opium; and if Opium had also been suppressed, they would have worshipped Cocaine, or Coffee, or Tobacco, or even Tea, or would have been tempted by some other demon as yet, fortunately, undiscovered. But Rum has been on earth since

The European Outlook

nobody knows when, and still is on earth—very much on earth—greatly to the distress of many good people of negative appetite who love the Angel Temperance. Now, theoretically, we hate Rum like poison, but he is a big devil pretty strongly entrenched behind the affections of many classes of men, and even women, and if he is to be ousted from any one of his earthworks his whole front has got to be driven back simultaneously. We wish the temperance advocates, and especially the Christian Temperance Union women, understood this—they could if they would inform themselves of certain conditions that have recently developed near the national old soldiers' homes. A year ago the Sundry Civil Appropriation bill abolished the canteens heretofore maintained. In the name of temperance what has this abolition accomplished? In eight months, according to Major MORIS HANIS, general treasurer of the board of managers,—

The number of cases of acute alcoholism treated . . . increased. The smallest increase reported was thirteen per cent. at the Pacific Branch (Santa Monica, California), and the largest, ninety-one per cent., at the Eastern branch in Maine.

The largest increase was at the Maine home, and Maine is a "prohibition" State! In explanation here is a compressed statement from the report of the governor of the home:

The number of saloons which have been established in the vicinity of the home since the anti-canteen provision cannot be positively stated, because such places attempt to work secretly. Observation would indicate that the number has more than doubled. There are now places in the vicinity of the home to which the members resort in large numbers to all appearances for no other purpose than to obtain liquor. This liquor is of the vilest. Pocket peddlers are numerous. None of them have become so bold as to attempt to ply their trade within the reservation.

Of such a nature are the recently developed conditions of which we spoke. Nor are these conditions peculiar to the vicinities of old soldiers' homes; they are also to be found near most of our army posts, and are so detrimental to the service that General FREDERICK DENT FRANT, who prides himself on being a total abstainer, said not long ago that he was in favor of re-establishing and maintaining canteens until "the time comes when the civil authorities abolish those dens near military reservations kept by vicious persons who tempt the soldiers of our army to their destruction."

Oh yes; a Great Gain

The Minneapolis Journal says:

HARPER'S WEEKLY says BRYAN'S talent is histrionic, not political. If we could get Mr. BRYAN shunted to the stage and lose some actors we might name in the world of politics, there would be a gain all round.

The Appointment of the Major-General of the Cuban Army

Senior PABLO GIVENS, Cuba's most successful revolutionary, by the grace of Governor MAGON has been appointed Major-General of the Cuban army. Set a thief to catch a thief—revolutionist is such an analogous principle that probably it also will come to be in time an accepted truth. Manifestly the judge has thrown the appointment at two birds; not only at whosoever other than GIVENS may become a rebel, but at GIVENS himself in the same capacity. We have a precedent for the judge's maneuver in mind. Away back in the forties or fifties of the last century the much-demonstrated ANTONIO LOPEZ DE SANTA ANNA organized in Mexico a force of mounted policemen, who, because of their dress, were nicknamed "Cuerales." These horsemen persecuted the bandits with more or less success until SANTA ANNA's death, and then took to the road themselves. They established a headquarters in the Malinche Mountains, near Puebla, and achieved success almost immediately. Indeed, they acquired so much gold and silver that they plated their clothing and sabblery with the metals, and came to be known as "Plataados." Now it goes without saying that their suppression was attempted, and failed. But General LUCAS COMONFORT, who was President of Mexico not long after SANTA ANNA, seems to have been much such a practical psychologist as Governor MAGON, for he made the "Plataados" a proposal; they might either continue to risk the short shift when captured, or enter again the service of the government. To a man, almost, they accepted the second alternative, and became once more instrumental in the suppression of brigandage. Since, as an organization they have continued to live, and are known today as the state's Rurales.

At present there is no war cloud on the European horizon, if we except the threatened demonstration against Turkey by twelve Italian battleships, for the purpose of compelling the last-named Power to make reparation for the recent murder of an Italian priest and to permit Italy to open post-offices in certain Ottoman seaports. As Turkey has only one battleship and no first-class cruiser, and as she could not reach Italy on land without crossing Austrian territory, of course she had to comply with the Italian ultimatum: otherwise she would lose Tripoli, the last remnant of her once extensive North-African dominions, as well as all her islands in the *Agæan Sea*, to which Italy, as the heir of Venice, believes herself to have a moral claim.

At present there is no apprehension that the Macedonian question will kindle a conflagration in southeastern Europe, for all of the great Powers, including England, seem inclined to accept Russia's programme of Macedonian reforms, which is less offensive to Ottoman dignity than that formulated by Sir EDWARD TAYLOR.

The suspicion and resentment aroused in Russia and the South-Slavic states by the announcement of Austria's intention to exercise the right given her by the Treaty of Berlin to extend her Trans-Bosnia railway through the district of Ost-Banar to a junction with the Turkish line running to Salenica have been allayed by her consent to the construction of another railway connecting the Danube with the Adriatic, and passing, so far as its eastern section is concerned, through Serbia.

In the relations between Germany and France there seems no longer to be any tension with reference to Morocco, the Berlin Foreign Office having been convinced that France has no design of acquiring territory in Northwest Africa, although she may be compelled to occupy not only the seaports of Morocco, but some strategic points in the interior of that country, so long as troubles are to be feared. There is the less ground for dread of Germany's interference with the French plans for restoring order in the Shereffian possessions, because Emperor WILLIAM II. earnestly desires a friendly understanding with FRANCE, if only to induce French bankers to subscribe to the new German and Prussian government loans.

Relieved for a time by her treaty with Japan from the necessity of maintaining a great army in the Far East, Russia is devoting her attention to internal affairs. The third Duma is accomplishing far more in the way of substantive legislation than was effected by its two predecessors. It is now evident to all on-lookers that if the first Duma, like the present assembly, had been elected on a narrowly restricted franchise, the Russian people would have escaped two years of agitation, and their education in the art of representative self-government would be more advanced. The blunder of beginning with a close approach to universal suffrage in a country where self-rule had hitherto been unknown was the less excusable on the part of Count WITTE, because he had under his eyes in Prussia an electoral system, which, however disastrous to the proletariat, indubitably assures ascendancy to the property-owning and educated classes. The third Duma, which resembles the Prussian Chamber of Deputies as regards the methods by which it was chosen, contains a very large majority of Conservatives and Moderates, who have shown themselves able to exercise much influence over the Czar. They have, for example, prevailed upon him to renounce the naval programme, upon which he was said to have set his heart, and which contemplated an expenditure of from half a billion to a billion dollars, and persuaded him that, for some years to come, almost all of the money at Russia's disposal for defensive purposes should be allotted to the army. Experience has shown that Russia can never become a great sea Power, so long as she is prevented from using the Dardanelles, whereas, in spite of the sort of stalemate which she experienced on the Manchurian chess-board, she is still unquestionably one of the greatest land Powers on earth. There is no doubt that the money necessary for the reorganization, re-equipment, and enlargement of the standing army will have to be secured abroad, and we may take for granted that the present Duma, unlike its predecessors, will sanction the transactions needed for the purpose. It is improbable, however, that any attempt to borrow money in France or England will be made by the St. Petersburg government until after the Imperial German and Royal Prussian loans, collectively amounting to over \$160,000,000, shall have been placed. Much of the sum to be raised by Prussia will have to be used to carry out the plan for the expropriation of Polish landholds in the provinces of Posen and West Prussia, while, on the other hand, a large part of the funds secured for the Imperial re-equipment will have to be applied to the execution of the naval programme, which, as lately revised, calls for the laying down of four *Brandenburs* annually, up to and including 1911. France, by the way, is in haste to complete this year of six battleships, which are to be, we are told, more powerful than the *Brandenburs* or our own *Delcourts*. In view of this project on her part, and of the fact that there is no longer any doubt of Germany's financial ability to carry out her latest

scheme of naval expansion, it would not be surprising if in 1909 Great Britain should decide to build no fewer than ten battleships of the highest type annually for three years. Only in that way could her navy be kept up with certainty to the "two-Power" standard.

An influence that will make strongly for the maintenance of the world's peace is Great Britain's consciousness that her capability of engaging in war will be lessened materially if the costly old-age pension scheme shall become a law. For the moment, indeed, she has no apprehension of being forced to become a belligerent—thanks to her *entente cordiale* with France, her convention with Russia, her alliance with Japan, and her arbitration treaty with the United States. Her alliances with Japan, however, which is regarded with less and less favor by British subjects in the Orient, expires by limitation in 1915 (unless previously renewed), and those British may find herself involved in new exigencies and complications.

For the present, however, the skies look serene. The one European country which is now threatened with grave internal disorder is Portugal, where the Republicans, having succeeded in electing only a few members of the Cortes in the recent general election, are evincing an inclination to revert to violence, in order to bring about a revolution. The present ministry, which is the outcome of a coalition of several monarchist groups, seem to shrink from complying with the unanimous demand of the diplomatic corps at Lisbon that a resolute effort be made to unravel the conspiracy of which the late King and his eldest son were victims, and to ferret out the assassins. It is on the cards that, owing to their indecision and timidity, the royal family may feel constrained to recall Senhor Franco and clothe him once more with dictatorial powers.

Two incidents conducive to the mitigation of the horrors of warfare and to the preservation of the world's peace have occurred during the last few weeks. In the first place, Great Britain has invited all the Powers that participated in the second Peace Congress to attend a conference to be held this summer in London, with the object of agreeing upon a code of international maritime law, to be applied, in the event of war, by the new International Prize Court which was created last year at The Hague, but which, as yet, has not been organized. The other incident to which we refer is the rumored discovery of the means of imparting such stupendous velocity to a projectile as to render it possible to bombard Paris from London or vice versa. How long would it be after the British or French capital should have been devastated by this interesting engine of destruction before the citizens would rise in tumult and force their government to arrange a peace? As soon as war becomes intolerable, it will necessarily come to an end.

The Spring Woods

"We are all under sentence of death," writes PATER in the famous concluding paragraph; and in view of the brevity of our stay and the uncertainties hereafter, he warns us each and all not to spend our little interval in idleness, but to join ourselves to the wisest among the children of this world and give ourselves to art and song.

True, indeed, it is that art and song bring their own reward, but it is difficult to point to any one way of spending life and name it the wisest. Socrates, for example, did not spend his little interval in art or song, and yet it is fair to take it that he got a good deal out of life. As for the real sensation of desiring the rhapsody of the sage, the average mortal is most like to win it by spending long, idle, rambling days in the spring woods. Let him take an thought of what he shall eat or what he shall drink—a single apple in a pocket will provide amply for all the necessities of a long day; and as to what he shall wear, the main qualities of his garments should be age, familiarity, toughness; and then let a man, unimpeded by any object or goal, set forth with an open mind to admire how the world is made. For just at this time of the year it is wrought with miracles of delicacy and intricacy and beauty beyond speech.

Every place in the world has its own time for perfection. One never can echo quite whole-heartedly SHAKESPEARE'S,

"Oh, to be in England
Now that April's there!"

Not that England has not personal charm; but why not be there in June, while one's about it, when the cold and the drizzling grayness are once and for all folded up and laid on the shelf, and when the larks wheel, circling, singing over every field, dropping their "silver chain of sound"; when all the wild flowers of MEXICO'S "Lydia's" and AFRICA'S "Thyris" and SHAKESPEARE'S "Question" are trailing and blooming and bedecking the whole face of the earth, and when every wind that blows is faint with the fumes of sunlight and of earth? Every one who is attentive to the real

business of life, the esteeming at all the stray ends of beauty and helping them in a treasure-house of memory, knows that the proper time to see Normandy, Brittany, and the New England hills is in June, when just a little forecasting tinge of frost is in the air, glinting white over the meadows in the early morning. Just by way of adding glitter to the flicking percent of the autumn leaves. But if one owned the magic carpet, as truly all human beings should if the world were properly constituted, one would sit down upon it, just about the fifth of April every year, and give the order, "To the Southern woods." But probably it would be better to leave the carpet by the roadside, near some old historic town, and walk, for it would be a pity to miss the mile-long hedges of golden brown fringing out their wild arms over the straggling white road that runs

"Like a lane out of heaven that leads through a dream."

Such a sight, it would seem, is almost equal in its glory to WINTERBURN'S daffodils:

"And all at once I saw a crowd,
A host of golden daffodils."

How the words bring the picture to the mind! He must have made a sudden turning, and come upon them quite by surprise—a whole field of molten gold, ten thousand daffodils waving in the wind. What wonder that SHAKESPEARE, falling upon a like experience, should have dreamed away with sheer delight of the vision, since SHAKESPEARE was so slightly bound down to earth that emotion invariably snapped the frail tie. Whoever has driven up a certain bare rise of land and overlooked a tiny, worn-out, but once historic, small village in Virginia, has seen a sight not less overwhelming in its glory, miles upon miles of the golden broom hedged.

And then one penetrates from the roadside into the sedition and checkered light of the woods. The trees at this time of the year combine the beauties of both winter and summer; they are still partially bare to the blue sky, letting through wonderful lace-like traceries, and yet the tender green bespeaks the fuller shade that shall come when the sun has worked himself up to its full midsummer fever. The long needed pines long with brown cones overtop the other trees, their great, straight, aspiring stems drawing lines in the wilderness, and below them the low-growing wide-spreading dogwood raises its layers of pure white blossoms, like an unexpected shower of baby moons caught on the bare branches and held, and in between, for sheer insurance and supererogation, the red bud and the Jodas-tree and their flash of colors. Lesser still there are wild knot-like tangles of coral honeysuckle and yellow jessamine clinging to the hoary trees, and still lower the wild amaran blossoms, pink and white in her golden leaves. Just peeping above the dead leaves there rise the yellow lady-slipper orchids, green jacks-in-the-pulpit, serious, straight, and comical withal, and everywhere sweet-scented blackberry. As one nears the edge of the wood, what more natural than a wide stretch of the red columbines, hanging jewel-like above their tender, sublimated clover leaves!

The soon hour should be spent deep in the woods and among the tree tops. One need not climb, but, lying flat on one's back, one sees all the affairs half way between earth and heaven. A bald-headed mother eagle may be scolding her three awkward young ones in the nest and spurring them on to make an effort to fly. There is much encouragement to be derived from seeing an eagle, hovering on the branch, flapping his wings, and afraid to trust himself in the air, and then, suddenly, soaring off so easily and comfortably.

And there is the monastic stillness, with the sun throwing fantastic shapes of light on the ground, out of the quiet and the silence the little furtive wood noises penetrate,—the tapping of the woodpecker, the squirrel's chirp, the whirr of wing as the humming-birds fly past, and the drone and buzz of insects. No birds sing just at this hour; but blue and scarlet and cardinal color, olive and gray and brown, the little specks of melodious life fill past us, least doubtless, too, upon the bounding of beauty after their kind.

The hours move slower in the afternoon. Before the great catastrophe of sunset there is a pause, a retard of the action of the daily pageant. The slant rays of the sun finger lazily among the briers and the bushes; a golden and sunset haze glows over all the woodland greenery. The day is growing gray and reverend, slow of movement, and majestic. The color in the woods fades, and a purplish-brown mist, called darkness, begins to rise from the breast of the earth. Then to the edge of the wood for a sight of the open sky, where the lord of the world is sinking, drawing after him the great wing-shaded, russet-hued clouds. Pale lines of prismatic yellow, streaks of green and lilac and purple, the back of the flaming clouds.

"Look now where Coler, the son's bridegroom, makes
The house of heaven splendid for the bride."

With the flowering of heaven color dies out of earth, it takes on a pale and ashen hue; no richer the evening comes, and the day in the spring wood dies, as all things die. But who shall say that

song or picture could have inculcated greater strength or more wisdom?

"I am strong with the strength of my lord, the sun:
How dark, how dark soever the race that must needs be run
I am lit with the sun.
Oh, never the mast high run of the sea
Of traffic shall hide thee,
Never the bell-colored smoke of the factories
Hide thee.
Never the rock of the time's tempest-tides
Hide thee,
And ever my heart through the night shall with knowledge abide
Thee.
And ever by day shall my spirit as one that hath tried thee,
Lalor, at leisure, in art—thou under beside thee,
My soul shall float, friend Sine,
The thy being done."

Correspondence

PRESERVE THE FORESTS

THE SOCIETY FOR THE PROTECTION OF NEW HAMPSHIRE FORESTS.
CONCORD, N. H., April 4, 1902.

To the Editor of Harper's Weekly:

Sir.—Unhappily, as the part of the leaders of Congress to permit legislation at this season beyond the regular appropriation bills works particular hardship in the White Mountains, the protective forests on the high slopes have been going at the rate of 200 acres daily, or 25,000 annually, which affects the agricultural, manufacturing, and navigation interests throughout New England.

The bill for antitrust legislation in the White Mountains and the Southern Appalachian Mountains has been endorsed by the entire country. Lumbermen and paper-makers, farmers, and business men, and the press, without exception, have urged this measure for five years. Two years ago it passed the Senate, and was recommended unanimously to the House of Representatives by the Committee on Agriculture, but owing to the opposition of the Speaker did not then become a law.

At a recent hearing before the present Committee on Agriculture, the Governors of Georgia and New Hampshire, with official delegates from the Governors of twelve other States, and a group of two hundred business men and citizens from all of the States east of the Mississippi, except four, presented evidence that the timber supply is disappearing, that water powers are affected, that navigation is crippled, and that agriculture in the low lands, particularly in the South, is, in many cases, wiped out by floods. Delegates from the Pittsburg Chamber of Commerce showed that recent floods cost that city ten millions of dollars. Lawrence, Massachusetts, sent a delegation, including the mayor and the president of the Board of Trade, to show the importance of the Merrimack for drinking water, as well as for power. To all these Congress apparently has turned a deaf ear.

When the matter came before the Judiciary Committee, the Governors of Massachusetts, Connecticut, and North Carolina sent able lawyers to Washington to prove that the matter is one in which Congress has solicited power to act.

Neither the Committee on Agriculture nor that on Judiciary has made any report, and the impression prevails at Washington that they do not intend to do so. Is there any reason why the leaders in the House of Representatives should longer obstruct the will of the people? When six New England States and eight Southern States unite in asking prompt action by Congress, do the men who guide that body propose to turn the matter calmly down? What do the representatives from the South and from New England intend to do about it?

We ask the co-operation of your paper to secure action at this session of Congress.

I am, sir, F. W. ROLLINS.

WORLD SHUT UP ANARCHISTS

MASSACHUSETTS, April 4, 1902.

To the Editor of Harper's Weekly:

Sir.—We note the request, by our President, for legislation against anarchy. Such legislation will raise questions as to constitutional rights and liberties.

We have a number of competent alienists who will solve that problem in an easy manner. No man of normal mind will be an anarchist. An anarchist is a dangerous lunatic, and should be placed where he will be kept out of trouble and taken care of.

Let the advocating of anarchistic ideas be proof conclusive of insanity: this is just, will get rid of them and educate against the ideas, as anarchy carries with it the idea of insanity.

I am, sir, A. PHYSICIAN.

JOSEPH BOAMIN VISION

April 12, 1902

To the Editor of Harper's Weekly:

Sir.—At various times between 1820 and 1830 there appeared in the newspapers of the country what was called "The Vision of Joseph Boam." Boam was a preacher in the Society of Friends of some local reputation in the interior of New York State, where he resided for many years. The vision was first revealed to the particular meeting over which he presided and then gradually and extensively circulated in printed form through the Eastern States. The discussion which it then provoked has long since been forgotten. Looking backward to-day, his predictions may at least

be called curious. The words taken from a copy in the possession of the Historical Society of Pennsylvania are as follows:

"In the year 1803, probably in the 8th or 9th month, I was one day alone in the field and observed that the sun shone clear, but a mist eclipsed the brightness of his shining. As I reflected on the singularity of the event, my mind was filled with visions (the most solemn I ever remember to have witnessed; for all my faculties were laid low and unusually brought into silence, I said to myself: 'What can all this mean? I do not recollect ever before to have been sensible of such feelings.' And I heard a voice from heaven saying: 'This that thou seest, that dims the brightness of the sun, is a sign of the present and the coming times. I told the fathers of this country from a land of oppression: I placed them here among the forests. I blessed them and sustained them and while they were humble I fed them and they have become a numerous people. But they have forgotten me who nourished and protected them in the wilderness, and have become proud and lifted up, and are running into every abomination and evil practice of which the old country was guilty. They have taken quite from the land and have suffered a dividing spirit to come among them. Lift up thine eyes and behold.' And I lifted up mine eyes and saw them dividing in great heat. This dividing began in the Church on points of doctrine: it commenced in the Presbyterian Society, and went through all the various religious denominations, and in its progress and close its effects were nearly the same. Those who departed went off with high heads and taunting language, and those who kept to their original sentiments appeared exercised and sorrowful. And when the dividing spirit entered the Society of Friends it was in a similar manner as in any I had before discovered. And as before, those who separated went off with lofty looks and taunting, censorious language: those who kept to ancient principles retired by themselves. It next appeared in the bodies of the Freemasons, and set the country on fire for a time. From that time it went through the United States and did not stop until it produced a civil war, and an abundance of blood was shed. In the course of the conflict the Southern States lost their power and slavery was annihilated from their borders."

Then a monarchical power arose and established a national religion and made all Societies tributary to support its power. I saw them take property from Friends. I was amazed at all this, and I heard a voice proclaim: 'This power shall not always stand, but with it I will chase the Church until they return to the faithfulness of their forefathers. Then a great war is coming upon the active land because of their impiety and for the blood of Africa, the remembrance of which has come up before me. This is not yet for many days.'

"I had no idea of writing this for many years, until it became such a burden that for my own relief I have so written it."

(Signed) JOSEPH BOAM. Two generations of Americans have passed away since Boam thought he saw disaster looming up for the young republic on the eve of reason of a particular sin upon which his vision was cast. For the sake of argument we may assume—or rather, we are asked to believe the repeated statements of our present rulers—that the intervening years every grade of sin has been committed. Should we therefore look forward to a new dispensation to the approaching change? Or is the present dispensation a part of the punishment hung foretold?

Is Saul also among the Prophets? Perhaps Mr. Roosevelt might be persuaded to answer in a special message.

Yours truly, E. H. M.

OUTDOOR ADVERTISING

PASADENA, CAL., April 12, 1902

To the Editor of Harper's Weekly:

Sir.—Referring to the request of the President of the American Civic Association in your issue of April 11, for an expression of opinion regarding the practical effect of offensive outdoor advertising on purchasers, I can say for our reader that I not only have never made a purchase on the strength of such advertising, but on the contrary am always positively against articles so advertised.

I am, sir, E. H. SACRENT.

THOMAS HOLLAND, ANCESTOR OF WASHINGTON

CHAMBERSBURG, PA., February 12, 1902.

To the Editor of Harper's Weekly:

Sir.—In your issue of February 12, the article by Caroline Tucker on "Washington and his Surprising Ancestor," has greatly interested me, and I write to specially thank the author for the genealogical table. But I wish the table had also stated the fact that John, the fair maid of Kent, married, secondly, Edward de Black Prince, and thus their child, Richard the Second, was the half brother of Thomas Holland, the ancestor of Washington.

In my childhood my favorite book was *The Legends of Lancashire* by Charlotte M. Yonge. I loved to read of that little group of people at the court of the invalid Black Prince at Bordeaux—Lord Edward Barry de Looze, Thomas Holland, and the beautiful lady Richard.

In after years when I stood by the tomb of the Black Prince in Canterbury Cathedral, I thought of Miss Yonge's picture of the lovely but anxious Joan and her boys.

I had learned through history of the death of the little Lord Edward and the tragic visit of Richard and Henry of Lancaster, but I had often wondered about Thomas Holland.

And now, after more than forty years, it is interesting, indeed, to trace in this genealogical table the line of his descendants down to our own Washington.

I am, sir, MARY H. HENDERSON.

Finance

The Dependence of Railroad Security Values on Rates

By HOWARD SCHENCK MOTT

At a meeting of the Economic Club of New York, held in December, 1907, Inter-State Commerce Commissioner Prouty, in addressing the club, stated, in effect, that railroad rates should be so adjusted as to allow a reasonable return to stockholders; that any higher rates would be equivalent to an unjust tax on the community, even if the revenue derived from high rates were spent in improving the property or in building new lines, and that all improvements and new construction should be paid for out of the proceeds of new security issues. To make improvements and to build new lines, he contended, relied for the investment of additional capital in the railroad business, which new capital should not be raised by taxing the community, through high rates, to produce it.

Continuing the discussion, after adjournment, Mr. Prouty was asked how it was proposed to provide for the interest or dividends on securities to be issued to pay for improvements and new construction. He replied: "Out of the normal increase in railroad revenue," stating, in illustration of the possibility of such provision, that one road in the Southwest had shown for eight months (presumably during the fiscal year 1906-7) a very large increase in gross earnings and a still larger increase in net earnings. He was asked whether the road referred to was making any such good showing at that time and whether any road in the United States then made such a showing, to both of which questions, of course, he replied in the negative. His attention was called to the fact that railroad operating expenses had been growing steadily for a year and a half, and he was asked how, in view of that fact, it was proposed to provide for interest and dividends on new securities "out of the normal increase in railroad revenue." To this question he replied: "If operating expenses continue to increase, railroad rates must be advanced."

Mr. Prouty is a public-spirited and conscientious public servant, but he seems to have fallen into a rather common error in supposing that there is, or can be, such a thing, uninterrupted, as "the normal increase in railroad revenue." Existing economic conditions, at least in their acute manifestations, present apparently new phases of finance and industry. Of these conditions and their ramifications it will not be possible to treat in detail. Some of their phases seem new only through misunderstanding of old problems. The conditions comprise, among many, the relation of all industry to the supply of capital; the fact that, as all civilized countries use gold as the standard of value, the increasing supply of that metal throughout the world depreciates the purchasing power of the gold dollar—a phenomenon which finds its reflection in rising commodity prices; the growing power of labor organizations to compel the payment of high wages, etc. It is sufficient for the present purpose to point out that, during the past decade, rising commodity prices have increased railroad costs, probably as they have manufacturing and other costs. Within the past few years the wages paid on American railroads have risen fully twenty per cent., and materials used by the railroads have advanced in prices, in ten years, from forty to fifty per cent. In addition to these items of increased expenditure, railroad taxes have been increased, and State and national legislation has added much to the burdens of the railroads. Meanwhile, railroad rates not only have not advanced, but as a matter of fact have declined.

Now, then, does it happen that, up to about a year ago, railroad earnings increased? Partly because the prosperity of the country produced a traffic so enormous as to enable the railroads to reduce grades and curves on their road-beds, lay heavier rails, and purchase engines of greater power and earn of larger capacity—out of earnings. The average train load, the cost of operating efficiently, grew steadily. In 1896, however, the congestion of traffic, due to the abundant harvests of that year and the stimulation of business they created, was so great that previous methods of economical handling of traffic were found totally inadequate. Efficient train-hauling had to give way to any means that would move freight. One important result of the heavy traffic of that period was that the railroads advanced wages whenever a demand was made on them rather than risk the loss of revenue that might result from a dispute with their employees. In the conditions existing two years ago apparently can be found the beginning of the present acute phase of the problem of high operating expense. It seems possible, also, that, under the most favorable conditions, there may be physical limitations in the development of train-hauling. If the railroads are unable to spend money to improve their road-beds and their equipment, the development of train-hauling necessarily cannot go on.

Today the railroads labor under a burden of high operating expense for which their management can no more be held wholly responsible than can the baker for a rise in the price of flour. The

railroads, so far, have not been permitted to advance their rates; but the baker (when the price of flour rises materially, can, and does, advance the price of bread). It is true that, by decreasing facilities wherever possible, such as taking of trips by reducing the number of employees, and by the small declines in the price of materials and supplies that have recently occurred, the railroads have managed temporarily to keep their heads above water. Possibly, in the near future, the prices of materials and supplies used by the railroads will decline somewhat further, but that they will decline to anything like the extent that they have risen in the past few years appears highly improbable. As to railroad labor, its costs as much now, per unit, as it did two years ago at the height of the most prosperous period in American history; and there seems to be small prospect of decreasing this element of cost without bringing a train of evils worse than those which now exist. Consequently, the railroads have announced that they will not reduce wages except as a last resort.

Of what, at the present time, does "the normal increase in railroad revenue" consist, and, in the future, what will it be? If the economic conditions before referred to continue to influence the course of finance and industry, as they probably will do, it is likely, aside from fluctuations, that the tendency of the prices of commodities and of labor is upward. Necessarily, then, unless new methods of economy can be devised, railroad costs, through a series of years, seem bound to rise. Then, in the absence of opportunity and authority to advance rates, "the normal increase in railroad revenue" becomes a mere phantom.

This is an intensely practical matter, because upon the ability of the railroads to earn profits on the capital invested in them depends in the end their efficient service to the community. It is not possible to separate the business of the railroads from the financial markets. If the railroads must hereafter make improvements and build new lines out of the proceeds of new security issues, they must be allowed to increase their rates. Capital needs the assurance of good earnings when it embarks in an enterprise. This is a matter of common sense and simple. At the present time railroad securities are discredited in the investment markets, partly, no doubt, because of exposures of abuses in corporate management, but more largely for the very plain reason that the transportation industry appears to the investor to be one in which capital cannot be employed as profitably as it can in other directions. These are stubborn facts that confront the country. Wall Street recently was full of rumors of a coming advance in freight rates, but until the meeting of the presidents of the Eastern trunk lines, the rumors appeared to have little foundation.

That the Inter-State Commerce Commission also realizes the exigencies of the present situation hardly may, perhaps, be inferred from the following extract from an address delivered at the annual meeting of the American Academy of Political and Social Science on April 11 by the Hon. Martin A. Knapp, the Chairman of that body. Mr. Knapp disclosed speaking for any one except himself, but his views are so interesting and so pertinent that they are reproduced:

"In the passing of a generation, as it were, the railroad and the steamship have transformed the whole of industrial and social life. They have enriched every occupation, given added value to each product, added to the means of human enjoyment, and made us vast wealth possible. At once it is the greatest achievement and the greatest necessity of our modern civilization; but we do well to remember that this marvellous achievement has been accomplished by private enterprise and private capital, and that we must look—we certainly should look—to that same source for its further and adequate development. Far distant be the day when any thoughtful man will seriously contemplate a different national policy. But if we rely as we should on private enterprise and private capital sufficiently to increase our transportation facilities, we must make that primary vocation so attractive in its opportunity and its responsibility that it will command for its management the best and ablest men the nation produces, and be sufficiently lucrative to assure the necessary investment of money to realize our further needs. In a word, we need our best men in this primary business, and a very large amount of money, to make it successful. This, in a word, simply means, as I take it, that whatever may be our National or State policy, whatever prohibitions may be enacted or privileges restricted, there must be opportunities to charge rates which will give sufficient coverings to make the business fairly profitable and to attract sufficient capital for its adequate extension, and it does not matter, as I see it, whether the popular estimate of railroad managers is personified by a man as capable and as popular as Mr. Stevenson Fish, or by the man with whom it appears Mr. Fish has lately had some friendly differences. Without regard to the personnel of railroad officials, without regard primarily to the interest of stockholders, in the interest of the public welfare and estimated prosperity we must have the railway earnings continue to be adequate for railway extension at advantage and profit."

The Scourge of the Yaquis

WHY AMERICAN LIVES AND CAPITAL IN MEXICO ARE MENACED
BY A HANDFUL OF SAVAGES

By MARC M. REYNOLDS

HAT a state comprising almost 78,000 square miles and having a population of 250,000 should be virtually at the mercy of a band of marauding Indians seems like a troubled dream of frontier life in the twenties, rather than a statement of present-day fact. Yet such is the case today in Sonora, the second largest state in the republic of Mexico. Sonora is suffering from the predatory warfare of a band of Yaqui Indians who do not exceed 5000 in number. The industries of the state are declining; the towns growing smaller; the ranches generally are deserted, and there is an air of desolation and despair prevalent throughout the region between the Cananea, Yaqui River, and Pacific Railroad on the west and south, the Yaqui River on the east, and the boundary line dividing Mexico and the United States on the north. It seems strange to the student of modern progress at long range that such an apparently absurd condition of affairs can exist; but the fact is not puzzling to any one who is familiar with the conditions of government in Sonora, the kind of Mexican soldiers who are in the service in Sonora, the topography of that portion of the country where the Yaquis make their headquarters, and the methods of warfare employed by these Indians.

It is possible to hear as many different stories about the Yaqui trouble as the number of people one meets after crossing the Mexican border at Nogales. Some of them have foundation, but

One of the Mexican Methods of Yaqui Extirpation

many of them spring from fear and the imaginative brain of the Mexicans, while others are ingenuously colored by the few American travelers who go to Sonora for their health, or to seek wealth in the heavily mineralized mountains.

When I reached Nogales on February 26, I began to hear the word "Yaqui" used frequently in conversation between Mexicans, and I noted an undercurrent of anxiety among the people. The Cananea, Yaqui River, and Pacific Railroad had abandoned its night service, and was running trains in the daytime only, under guard of Mexican soldiers. This, I learned, was due to fear of attack by the Yaquis. When we arrived at Santa Ana, Mexico, I saw a corral in which were eleven hundred Yaqui men, women, and children who had been gathered in by the troops and who were about to be deported to Yucatán. All along the line of the road there was much evident uneasiness, and the atmosphere of the country seemed charged with a spirit of apprehension. At Hermosillo, the capital of the state, I met Governor Torres, the man on whom rests the duty of protecting the people and the country from the ravages of the Yaquis. Very plainly the lines in the Governor's face indicated worry. Even in Hermosillo, surrounded by all the protection he could summon, there was no absolute safety. When asked about the situation the Governor said that he was doing all he could to aid the citizens in protecting their lives and their rights, but the citizens must do all they could to protect themselves. He had advised the people to go armed and to take no chances. When the train arrived at Torres, a little junction below Hermosillo, there was marked excitement. The day before, a band of Yaquis had come to the edge of the town, had killed four section hands who were repairing the railroad, and had then escaped to the brush. The little guard at Torres was a scene of activity. The train on the short line running to La Colorado was being made up of two coaches instead of one, and sixty soldiers were packed aboard, part of whom left the train about ten miles out to follow the tracks of the Yaquis. At La Colorado there was more news and more Yaqui talk. The Yaquis had been seen on the near-by hills that day, and a few miles out, near a place called Represos, and two days before, they had attacked and killed eight out of a party of ten. La Colorado is the last point touched by the railroad toward the western interior, and all travel toward the Yaqui River is done on mule or horse back, by wagon, or on foot. The popular mode of travel is on the back of a mule. One of the mining companies in the western part of the state had just sent some truck automobiles to Sonora. I was invited to accompany the party on the initial trip as far as the Yaqui River. These automobiles had bullet-proof shields, which, with an escort of twenty soldiers, promised safety. At different points the Yaquis were sighted on the hills beyond rifle range, but they made no attempt to interfere with us. Evidently the first automobiles introduced into that part of Mexico made them cautious, for the Yaquis do not take many chances.

Very few travelers were met on the way, and only a few of the haciendas we passed were inhabited. These few looked like forts,

The Kind of Yaqui preferred by the terrorized Citizens of Sonora

being provided with port-holes and stocked with arms and ammunition. At intervals of from fifteen to twenty miles the government had soldiers stationed, and at night we camped at one of the *caseríos*. Every new post reached brought fresh news of Yaqui killings. In a country without telegraph or telephone communication news travels slowly, but the air seemed filled with information showing that the Yaquis were certainly on the war-path and were systematically making raids on valuable points. Our report of soldiers kept up their heavy and shower by inhibiting freely of moral, the native intoxicant, and at times we were in more danger from the careless handling of firearms by the soldiers than from Yaqui bullets. At Toledo, on the banks of the Yaqui River, the real nerve centre of Yaqui atrocities was found. Toledo is a small burg, founded by some Americans from Ohio, who invested upwards of a million dollars in buildings and a smelting plant. Just as the plant had been completed, the depredations of the Yaquis became so frequent in the surrounding country that the

wounded several others. It has been estimated that fully two hundred Yaquis were engaged in that battle. Sonqui Grande has been the scene of several earlier raids by the Yaquis, and they have killed in all more than one hundred people. On January 3 of this year, an American named Mark Perkins, and a party of eight others, including his wife and three children, were killed as they were driving along the road near La Bula. About the same time at the Delores ranch, two hundred and fifty miles from La Bula, the Yaquis killed sixteen persons. In February eight Japanese and some soldiers were killed near Guaymas, at the important gulf coast town of Sonora. Guaymas is one of the best protected towns in the state. The Cananea, Yaqui River, and Pacific Railroad is building extensive shops and offices just on its outskirts, and near this point the government has an impressive-looking garrison where troops are constantly kept for emergency rail, and a lookout is continuously on duty in the watch tower to prevent sudden attack; yet the Yaquis made a raid, killed several, and got away

The End of the Day's Work

HOW THE MEXICAN AUTHORITIES ARE DEALING WITH THE SAVAGES WHO HAVE TERRORIZED A REGION LARGER THAN NEW ENGLAND

burro freighters abandoned work and cancelled their contracts to haul fuel and provisions, with the result that the smelter was forced to shut down, and two Americans named J. H. Harney and H. E. Cochrane were left and still remain with a few Mexicans to guard the property. The final decision to suspend all operations was reached after August 27, 1907, when at eleven o'clock at night the Yaquis made an attack on Toledo, killed three people, and wounded four others. Since that time all the country for thirty miles on each side of the Yaqui River has been cut off from the outside world, save where people have risked their lives to secure provisions.

Since January 1 of this year the Yaquis have been more warlike than for many years past. From their numerous raids, sometimes fifty miles apart, and the fact that frequently two or three occur on the same day, they would seem to be well organized and to be acting under competent leadership. For several years prior to this year they had apparently been split up into small bands, and when any attacks were made usually a band of from five to thirty Yaquis did the work. In February of this year, however, at Sonqui Grande, where the government continuously keeps a detachment of soldiers, the Yaquis killed twenty-five soldiers and

with little if any damage to themselves. While I was in Sonora, a period of six weeks, I learned of over sixty people who had been killed since January 1 by the Yaquis, and there were doubtless other killings of which I did not hear.

Naturally the question arises, why doesn't the Mexican government put soldiers in the field and stop these wholesale and murderous depredations? Primarily because the Mexican soldiers have never been skilled fighters, in the sense in which we understand the word in the United States. Their records in the war with Texas and in 1866 were far from glorious, and their present military system is open to criticism. The Mexican soldier is afraid of a Yaqui Indian, and he will run instead of fight when attacked, unless he is cornered; and judging from the records so far, the soldiers get the worst of every encounter, save when they are in overwhelming numbers. Every now and again, during past years, the government has made an effort to punish the Yaquis. Their efforts have been very irregular, and the usual form of warfare has been to capture all the peaceful men, women, and children of the Yaqui tribe who have been found in the various towns and deport them by steamer to Yucatán. Many really fine looking, peaceful Yaquis who did not take up arms against the government

have been sent away. Families have been separated, and, in the past, unnecessary cruelty has been exercised. Those who are left now are treacherous, bloodthirsty savages, and vagabond.

The history of these formidable savages is interesting. For hundreds of years the Yaguas held full sway in their country, along the Yagui River in the southern part of the state, in the Guaymas district. In the time of Cortez they numbered about 300,000, but the centuries of warfare have reduced their number. They opposed the Spaniards, and they have always been at war with the Mexicans. Though sometimes defeated, they have never been conquered, and today, with approximately less than 5000 able-bodied men, they hold sway over practically the whole state of Sonora, and seem to be as far from conquered as they were three hundred years ago. It can be said to have been the Yaguas that they have never taken the initiative in their warfare. They revolted against the imperial dictation of Spain in 1535 and in 1825. They opposed Mexican interference with their rights in 1832. From 1841 to 1848 they reigned supreme in their possessions, but in 1848 hostilities were begun afresh by the Mexican government, and a desolating war was waged until 1897. That year Governor Luna Torres, under a flag of truce, called the Yaguas together at Otila, where a treaty was consummated and accepted in good faith by the Yaguas. They laid down their arms, buried the tomahawk along with their mail, and returned to the peaceful occupation of farming. The government supplied them with farming implements; the fields were ploughed, the crops were in, and a happy feeling of settlement prevailed throughout the state of Sonora, as well as in the executive chambers at the City of Mexico. Land that had remained uncultivated, the ranchers having been killed or forced to run to save their lives, was reclaimed, and the Mexican cry of "Malo" was to be heard in the fields, as the peace ploughed, sowed, and toiled at the labors incident to ranch life on a Mexican hacienda.

Fate decreed, however, that this peaceful atmosphere could not continue, and in less than a year there were dissensions. Various reasons have been assigned for the trouble—it is believed that the most plausible reason concerns the Torres family. Governor Torres and his brother own a large ranch, consisting of several thousand acres, adjoining the Yagui lands along the river. To irrigate some of this land it seemed necessary to turn the water supply for irrigation from some of the Yagui lands into the Torres ditches, thus stopping the Yaguas' supply of water. General Torres's brother ordered the course of the water changed. The Yaguas resented their ditch. Again, by the Torres authority, the shut-off was made, and again it was opened by the Yaguas. Then the supreme power of the military was invoked; the flow of water was again changed; soldiers were placed at the point in question with authority to shoot to kill, and the inevitable followed. The Yaguas attempted to secure their rights, and some of them were shot. That was the brand that again kindled the fire of hatred and war in their hearts. The peaceful ploughs were forsaken for the warlike rifles, and the fields were allowed to grow up to weeds.

Since then a campaign of revenge has raged, and will probably continue for years to come. Not only is the situation serious for the Mexican people, but it is very serious for American capital invested in Sonora. From the banks in Hermosillo and Guaymas I learned that at the present time there are at least \$20,000,000 of American money invested in industries and mining in the part of Sonora menaced by the Yaguas. The mines are shut down, the industries idle, and as a result the banking interests are suffering, with no relief in sight. Protests have been sent to our government in Washington, and Secretary Root has been asked to interfere with the Mexican government at the City of Mexico, but thus far with no result. In some degree the Americans are to be censured for their indifference in the past. A few years ago, when three Americans from Chicago were killed by the Yaguas, a general cry was raised and our government asked for an explanation. Then the Sonora officials, sent from some of the American mining men, who were operating in a section at that time visited by the Yaguas, letters commending the protection afforded by the government, and copies of these letters were sent to Washington, with a report affirming that the Mexican government was doing all it possibly could to check such atrocities; and there the matter dropped. At Nogales Mr. Allen J. Bird, editor of *The Oaxaca*, the leading

A gruesome Attribute of a present-day Sonora Landscape

paper of that section, devoted largely to Mexican interests, and particularly to the mineral districts, showed me some correspondence which he had recently had with our government. Mr. Bird, who is a man of position, highly intelligent, and largely interested in Mexico, made a trip to Washington to intercede personally on behalf of American capital invested in Sonora, and to awaken some interest which might bring to an end the loss of American lives and property in the terrorized district. The last letter received from Washington after his return home gives no encouragement, and is, in fact, formal and indifferent in tone, though at the time of his visit Mr. Bird was encouraged to believe that there was relief in sight.

An official in one of the leading banks of Sonora told me that the resolution of affairs is beyond comprehension to any one not in very close touch with the situation. I asked him if I might use his name and be replied: "Yes, if it will do any good, and excuse the American government for some decided steps to protect us; but on the simple theory that some relief may come. I must decline. We who are in business in Mexico depend on the local government for such protection as we have, and we cannot afford to be openly antagonistic toward it; so we wait submissively, hoping that some relief will soon reach us." In conversation with other men of affairs, the same general answer was given.

It is from the ignorant and superstitious poor class that the Mexican government draws the rank and file of its soldiers. The military is divided into three branches: *Nacionalistas*, *Ramitas*, and *Regulares*. The *Nacionalistas* are equivalent to our militia. Their headquarters are in the City of Mexico, and they are better treated than the *Regulares*. The *Ramitas* come first in treatment and consideration. They belong to the customs service, being principally on duty along the border lines to prevent smuggling and to capture and punish smugglers. The *Regulares* are a promiscuous soldiery; most of them serve in the army as a penalty for some offense committed against the laws of the republic, and are sentenced to serve for such a length of time as their crime warrants, according to the judgment of the court. With the exception of the officers, most of the soldiers who have been sent to fight the Yaguas are these petty criminals, who have been forced into the service. It is easy to understand that such soldiers as these are not trained, have no patriotism, and will not fight except for self-preservation.

The soldiers are not drilled at rifle practice, and they know practically nothing about the use of their firearms, except what they have learned in desultory shooting. They must account for the ammunition given them, and in one case I saw a soldier with his cartridges tied in his belt so that he would not lose any of them.

In view of all these circumstances, it is scarcely surprising that the Yaguas are not conquered. The Yaguas are excellent shots, they are fighting for what they believe to be their rights, for their lives, and to revenge the wrongs they believe have been done them. They are Simon-pure Indians, with no mixed blood; they speak their own language, and they are ideal specimens of physical development, being taller, more muscular, and more active than the Mexican soldiers.

The Yaguas never ride; they always walk. Their powers of endurance are marvellous. They can, and frequently do, travel seventy-five miles a day—a fifty-mile jaunt is simple recreation. Each Yagui is a sharpshooter, and in an attack they fight from ambush, each picking his man, and then the firing is simultaneous. The country is for the most part covered with brush growing from ten to fifteen feet in height, with occasional openings. The trails or roads are through this brush, which is very thick and dense. The Yaguas keep watch on the hills overlooking the roads, and by a system of signals the Indians in the brush are informed of the approach of a party. When the party reaches one of the openings where the Yaguas in hiding have good aim, the deadly fire is opened. It is in this way that so many soldiers and citizens are killed, and simply to patrol a road so the government is attempting to do now, will not rid the country of these savages.

If the government expects to subjugate the Yaguas, soldiers must be sent into the hills, and an active campaign of extermination be rigidly carried on. Otherwise the raids will continue; property interests will suffer, life will be insecure, and no one can predict the end.

Baseball! In 1908

By E. B. MOSS

Spring Editor, New York
Evening Sun

THE initial major league games of the 1908 baseball season were attended by more than 130,000 spectators. Great New York led in attendance figures, the two games, between New York and Philadelphia, and Boston and Brooklyn, attracting more than 42,000 enthusiasts, many of whom waited at the turnstiles for hours before the parks were open. Philadelphia and Cincinnati turned out crowds ranging from 18,000 to 20,000; while the attendance at the games at Boston and Chicago surpassed these figures. This outpouring of fans is considered an omen that this season will see an unprecedented struggle for honors in professional baseball.

While all the clubs of the National and American leagues seemed bent upon to improve their strength in the box, at the bat, and in the field, the deals which attracted the greatest amount of attention were those all feasting the New York and Boston clubs in the senior league and the New York and St. Louis clubs in the junior organization. Eight players figured in the deal between the New York Nationals and their Boston rivals of the same league. Manager John J. McEwain in order to bring over material into his club, exchanged George Brown, Doc McInnis, Joe Dahler, Frank Bonnerman, and Cecil Ferguson for three members of the 1907 Boston team—Fred Toney, Al Bridwell, and Tom Needham. These men are players of exceptional caliber, and the majority of the erstwhile "Giants" were members of the famous world's championship combination of 1905.

Not to be outdone by his metropolitan rival, Manager Clarke Griffith of the New York American League club figured as the promoter of a trade by which he secured Harry Niles, Fred Glade, and Joe Hemphill, by turning over to the St. Louis "Brown" Harry Holloman, Jimmy Williams, and a cash consideration said to run into four figures.

The Chicago National and the Detroit Americans, winners of their respective league pennants last season, are certain to furnish all the opposition to the other teams which brought them home first in 1907. The Cleveland "Blues," the Philadelphia "Athletics," and the Chicago "White Sox" are as strong if not stronger than last year. Boston, St. Louis, and Washington are the dark horses of the American, or junior, League.

American Ambassadors Abroad

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

ENGLAND, of course, followed the Hill affair with the keenest interest. The reports of its details that came to us from Washington and Berlin were on the simplest and most satisfying scale, and everyone trooped delightfully into the field of conjectural scandal so entirely thrown open. From the turmoil of rumors and denials one fact was thought to emerge clearly—that the Kaiser, for unknown reasons repented his acceptance of Dr. Hill, and tried to withdraw it. It seemed, too, to be pretty well established that he mentioned the matter to Mr. Charlesmagne Tower, and that Mr. Tower, as he was bound to do, made it the basis of an official communication to Mr. Root. How the news of that communication came to be published was a point on which, so far as we in England could see, no light was thrown. Nor was it much discussed. The main interest centered on the motives that had impelled the Kaiser to make so astonishing a departure from diplomatic etiquette. As to this we were deluged with guesses and explanations. According to one report Dr. Hill, who was officially in charge of the arrangements connected with Prince Henry's whitewash tour through the States a few years ago, had had the misfortune (like the then German ambassador in Washington) to offend his august visitor. According to another, the Kaiser had been dipping into Dr. Hill's works, and had lighted on some passages not as laudatory as they should have been of Germany's aims and methods. According to a third, Mr. Tower had been prevailed upon by the Kaiser to remain in Berlin, and was casing about for an excuse to withdraw his resignation. According to a fourth, the Kaiser had been scandalized to learn that Mrs. Hill was one day discovered at The Hague doing her marketing on a bicycle.

But after all these theories had been examined and rejected, English opinion concluded, just, I should judge, as American opinion concluded, that the root of the trouble lay in "that eternal want of peace which vexes public men." Mr. Charlesmagne Tower, besides being of engaging personality, is a man of very great wealth. Throughout his term of office he has inhabited what, I think, quite the finest mansion in Berlin. He has dispensed a lavish and genial hospitality, and some at least of his wide popularity may fairly be ascribed to the superior and attractiveness of his entertainments. No one who looks the facts in the face can doubt that it has been a source of natural pleasure to the Kaiser, to the Court, and to the American colony in Berlin, to see the American ambassador upholding with such complete and elaborate success the social side of his position. That is a kind of achievement which carries greater weight in Berlin than in any European city. The German capital may still be a place of high thinking, but it is certainly no longer one of plain living. Berlin is a parvenu city, half-recked with provincialism. The Court, officialdom, and the dominant military caste only serve to put a little gilding on a life as coarse and crude and materialistic as the life of Chicago. The stolidity of a rather mean and arrogant militarism creeps through the city. The new Empire has brought with it a new commercialism, a new and infinitely lower code of morals, a new luxury, a new "touchiness" and self-assertion. Life in the Berlin of today is reckless and blatant and material. No community in Europe is so susceptible to the appeal of money and display; and I for one do not question in the least that the state which Mr. Tower has been able to maintain, his generous and finished hospitality, the style and scale of his personal appointments, and so on, have had a decided effect not only in confirming his own popularity but in enhancing American prestige. Such things, no doubt, should not be, but, having

been more than once in Berlin during Mr. Tower's régime, I do not hesitate to assert that such things are.

This was a situation that was altogether agreeable to the Kaiser. He liked Mr. Tower, and he liked to see American prestige so sumptuously upheld, and on both points, let us add, the American colony in Berlin has entirely agreed with him. My experience of the majority of Americans in Europe is that it gratifies them to see their ambassadors living in a palace, and maintaining an impressive social state. They do not want their representative to live in the British, French, or German equivalent of Harlem, but on the Fifth Avenue of the city in which he is accredited. It gives them, so far as I can judge, a real pleasure to feel that the American ambassador is more than holding his own in the social game, and that on all occasions of public or semi-public display, and in all the outward embellishments of life, he plays an elegant and conspicuous, even a brilliant, part. If the Americans in Berlin had been polled they would have voted to make Mr. Charlesmagne Tower ambassador for life. This, no doubt, would have been a solution eminently agreeable to the Kaiser himself. Failing that, he hoped at the least that the new ambassador would be able to continue the social successes won by Mr. Tower, and to maintain all the outward dignities of his position on the same scale as his predecessor. When, however, it was ascertained that Dr. Hill's resources only permitted of a modest establishment, the Kaiser, as a friend of America and anxious for the preservation of American prestige in Germany, felt that Mr. Roosevelt was making a mistake. He accordingly suggested to Mr. Charlesmagne Tower that while Dr. Hill, on all personal grounds, was entirely acceptable, the United States, for her own sake, would be better advised in sending a representative who would run no risk of being overshadowed by the ambassadors of other Powers, and who would be in a position to follow in Mr. Tower's footsteps with the same certainty and detail. Otherwise the new ambassador might be troubled by the awkwardness of the inevitable comparison, and the United States, in parting with the great power of social influence might be doing herself a political disservice.

No far as Englishmen could tell, these were the probable motives of the Kaiser's action. It was not meant in any way to be discourteous either to Dr. Hill or to the United States. The Kaiser had apparently convinced himself that the United States was embarking on a course which he believed to be injurious, and at the eleventh hour he tried to save her from it. The chief moral Englishmen drew from the whole unpleasantness was that Americans should at last act about recognizing their diplomatic service as a career. They have no personal interest in the matter. The United States has always sent her best to the Court of St. James. At the same time no one who goes about Europe can question that the American diplomatic service lends itself to some strange ineptitudes. In our capital you will find the American ambassador inhabiting a palace; in another he is worse housed than the average representative of a Balkan state. Mr. Roosevelt, I understand, acted, and quite rightly, to a system under which most coveted prizes in the American diplomatic service are falling into the hands of millionaires. He prefers, apparently, the old scholar-diplomat type. But it is very difficult to name a single capital in Europe in which such men could nowadays meet even the barest expenses of their position on a salary of \$17,500. If Americans really wish to avoid the social and political inconvenience and unfairness of appointing a man of moderate means to succeed a millionaire they will establish a permanent embassy of their own in all the leading capitals, they will make their ambassadors an entertainment allowance, and they will vote their salaries of not less than \$25,000 each.

KEMBLE

Women Golfers of America who will Figure in this Year's Contests, Here and Abroad

BY AN EASTERN PLAYER

Miss Margaret Curtis
HOLDER OF THE NATIONAL CHAMPIONSHIP

Miss Mary Adams
HOLDER OF THE EASTERN CHAMPIONSHIP

Miss Anita Phipps
SEMI-FINALIST IN TWO SUCCESSIVE YEARS

Miss Margery Phelps
SEMI-FINALIST IN THE 1907 CHAMPIONSHIP

Miss Marie Phelps
A PROMISING CONTENDANT FOR HONORS

WOMEN have taken much interest in golf since it was introduced into this country about fifteen years ago. The first Women's National Championship was played in 1895 at Meadowbrook. The competition was at eighteen holes, medal play, and there were only thirteen entries, the winner, Mrs. C. S. Brown, of Shinnecock Hills, taking 132 strokes, an excellent score in those days.

In the following year the Women's National took place at the Morris County Golf Club, and the scores showed a wonderful improvement over those of the year before. Miss Hoyt, then only sixteen years of age, made a score of 96, which would be a creditable showing for a golfer on any course to-day. Miss Griscom was second with 102.

For several years afterwards there was only a National Championship for women golfers, whereas to-day we have the National Championship, Eastern Championship, Western Championship, California Championship, United North and South Championship, and each district, Metropolitan, Philadelphia, and Boston, has its Association Championship, besides the Inter-City Team Matches and a team match played between the East and West.

The championship has been won on two occasions, the first at Wheaton, in 1903, and last year on the links at the Mohican Club outside Chicago, where eighteen Easterners made the journey to join the large list of entries.

The coming of Miss Edna Adair to the invitation tournament in her honor given by Mrs. Clement A. Griscom, at the Merion Club at Haverford, Pennsylvania, did much for American women's golf. It gave them all an opportunity to see the game played by one born and brought up on it. Miss Adair has played since childhood, and has lived in the golfing environment. Her visit here, and that of Miss Lottie Dod, infused a keener spirit; so much so that six American women went over two years ago to compete in the English Women's championship at Cromer, England. Those who went were Miss Margaret Curtis, Miss Harriet Curtis, Miss Frances T. Griscom, Miss Molly Adams, Miss Georgiana Bishop, Mrs. William H. Wood (née Emily Lockwood), Miss Ethel Burnet, and Mrs. Samuel Hettie. Miss Margaret Curtis and Miss Adams made an excellent showing.

This year all the women golfers should be more than interested in the coming English Championship to be played May 18 to 22, on the St. Andrews course, Scotland. Miss Griscom (champion 1904), Miss Anita Phipps (semi-finalist the past two years), Miss Adams (runner up to Miss H. S. Curtis in 1906), and present Eastern champion, Miss Margery Phelps (a semi-finalist, 1907 championship), and her sister, Miss Marie Phelps, are to play.

It is most probable that an arrangement will be made for an English team to be sent over here to play in our championship next fall at Chevy Chase, Washington, D. C., and that we shall pick an equal number to play a return international team match. If this could be done, women's golf in America would benefit greatly.

By Dog Sledge from Alaska to New York

ELI A. SMITH, A GOVERNMENT MAIL-CARRIER, WON A PRIZE OF \$10,000 WHEN HE ARRIVED IN NEW YORK ON APRIL 2, AFTER TRAVELING ALL THE WAY FROM NOME, ALASKA, BY DOG-SLEDGE. SMITH LEFT ALASKA ON NOVEMBER 14, 1905, AND HIS WARDEN HAD THAT HE COULD REACH NEW YORK IN LESS OF THREE YEARS. THE PHOTOGRAPH SHOWS HIM ARRIVING THE CITY HALL, NEW YORK.

"The Servant in the House" of Charles Rann Kennedy

By CHARLOTTE L. RUDYARD

CASIONALLY the accused and often culpable public has a chance to show that it rather enjoys looking into its own soul and is still able to appreciate an idea. To be able to entertain the public with ideas is no slight accomplishment, not to cause it to entertain ideas is in the nature of a triumph. "The Servant in the House," a drama by Charles Rann Kennedy, has had this effect upon New York. Happening upon Broadway in a doubtful time, it took a first step upon the stage and was a play, found foothold, took another, and was a book; and at this moment stands quietly on the pedestal of New York success, a live thing, eloquent, sunny, and mysterious, having something to say to the man in the street. Of a sudden "The Servant in the House" has become the thing to see and to read. When a play or a book has compelled the average man to use his spiritual eyes and admit that he has seen things, it makes understanding worth while.

The first day that the new hitler served at the vicarage was the day when the vicar William and his wife Martha found themselves beset by brothers, of whom the vicar had two, and his wife one. William, Robert, and Joshua, born to the working class, were as different as only brothers could be, especially Robert. An respectable people reckon, Robert has been a bad sort, drunken and shiftless, and so the vicar and his wife took his infant daughter away when he lost the mother, and saw no more of him for fifteen years. Then Robert turns up—a brawny, unskilled laborer, a workman on the sewers—on the day when the vicar's wife is expecting her own brother, the Lord Bishop of Lancashire, and the vicar his other brother Joshua. Joshua, like Robert, has been long lost, but is coming home the powerful Bishop of Benezes, with a promise to help William rebuild his church. The child Mary is innocuous in the house. The Lord Bishop of Lancashire, with goggles for eyes and a tin trumpet instead of ears, stumbles into the room and sits down to table in mistake the drainman for the vicar, and the latter for the Bishop of Benezes; and confusion has begun. That is the outer circumstance, born, as action must be, out of an inner conflict. The day that the latter first served at the vicarage was the day when the vicar was seized with unrest for certain nobility by the little girl, the innocent daughter of the drainman who calls "sweepings" at his brother's table, and talks with his servant. Then he turns again to his sewers, to discover the source of the strength that has kept the people away from divine service, and strikes the pit of it down under the church.

Like me he comes face to face with his daughter. She takes him for a thief. This is because she is nursing a dream that a father must be brave, beautiful, and good. This is why Robert himself will not tell her the truth. But Mary was Manson's first child in the house, and the grace is in her. Divinely a child, she looks upon this drainman, dark and dripping with the filth of his lowering, and hears with gladness his life to fear the foulness from the drain. Nobody tells her he is her father; she knows. And she tells him how she knows: "Because you are brave, because you are very beautiful, because you are good." What has become of the problem of William and Martha that pitted the soul of her against the soul of him to say whether or not the child should be told? What became of the depraved Bishop of Lancashire, and his little proposition, whispered in the supposed ear of Brother Benezes, to divert the funds of the church? Ask of the servant in the house. In and out with stately men, with steady tips,

with burning eyes, moves the man Manson. He is the mighty Bishop of Benezes in disguise. He is the Son of Man. He is the perfect brother, working on the heart of brotherhood in men.

So the house is rid of its abominations, including the hidden snail and the Lancashire bishop. Innocence has her father; penitence the vicar—in at rest with his conscience and his wife; the drainman has love and his work to do; and worldliness, who is Martha, abandons her idols and bows her head to her servant; while Manson lifts up the light of his conscience upon them and gives them peace.

One curious fact has resulted from the religious motive of "The Servant in the House." The play was frankly open to the prejudice of those who resent any stage portrayal of the character of Christ. That, by the way, is an accurate phrase; it is not the person of the Christ so much as His character that the man Manson represents. Shorn of the stage trappings, this is a man Christ-like in his heart, the embodiment of all love, the ideal brother that Christ was. The sensitive Christian will feel thus no wound to his reverence; only a jab here and there in the faces of his false gods, and at the mole in his own eye.

Furthermore, the churches have felt this, and set by-see are claiming Mr. Kennedy for themselves instead of declaring enmity; which is one more proof that the true religion is what Manson said his was: "I love God and all my brothers."

On the other hand this brotherhood doctrine, which is the message of our time, has suffered some damage from the sentimentalism, and it is vastly in the favor of "The Servant in the House" that it approaches the matter in a vigorous mood. Here is no gentle brother, meek and mild, but a worker and fighter. To tell one of the big brothers of the century, in "My Religion," has disheartened more than one aspiring soul by insisting that giving the cloak to him who took the coat meant exactly what it said, when there are many brotherly people who not only cannot afford it, but also do not believe it. Mr. Kennedy's brotherly fight for honesty and truth and justice, and is judicial enough to know that the cloak itself might sometimes be one of these.

Here, then, is a warm-hearted drama of humanity, a passionate comedy of the family, an allegory of twentieth-century Christianity. The first time such a play has found place in the midst of us just when illness seemed to have become more enduring than solemnity is of no small significance. The marvel too is that Mr. Kennedy's play is not solemn at all, except in aftermath. Laughter leaps in it, and the mind kindles to its delight. The author seems to have joined hands with humor, satire, and irony, and to have caught the lying glances of the comic spirit which George Meredith says is abiding overhead and looking down upon us with a contemplation humanely malign. It is easy to picture the author of "The Servant in the House" looking upon an audience at his own play—seeing it smile or weep or laugh in the wrong place, or pretend in vanity to understand, in his own vision meanwhile, what Meredith calls "the sunny smile of a fox."

All this is different from the recent pessimistic reading of life which Ibsen, for example, has made familiar. The Master-builder dreamed of building towers with high towers on them, and the end was human fragility; Mary dreamed of finding a father who should be brave and beautiful and good, and the end was a human being in the likeness of his God. Perhaps we are beginning to have done with destruction. Nobody, least of all the author, pulled down the vicar's house to repair that drain. "The Servant in the House" assumes the responsibility for the assertion that if you only wish very, very hard—and help to spin the fairy tale—everything comes true. Only a few may believe it, but a work like this has at least made belief easier.

AUTHOR OF "THE SERVANT IN THE HOUSE"

The Loan Shark

THE 'SCOURGE OF THE DEEP WATERS OF CITY LIFE

AN INCIDENT AND A LESSON

HEN, in sudden extremity—by reason of illness or another unanticipated financial tax—the small-salaried employee finds himself confronted with the immediate necessity for borrowing, the shadow of the money-lender falls athwart him. It is a black shadow which goes flickering about the streets of the city, and close behind it comes the money-shark, and it is truly an unlucky day for the man who turns when the scorching shadow falls upon him. For in a little while he will have stored up for himself many days of suffering and humiliation.

The loan shark is the most insinuating and relentless of all the scourges that live upon those of little means. She defies all the laws and humanities, and maintains her terrible trade by the fears with which, by warnings and threats, she fills the minds of her victims. Let there be one moment's relaxation of the victim's pledge to her, and she follows and hounds him until the full price be paid, year after year, if that be necessary, from place to place, or until flight or suicide shall have set him beyond the reach of her rapacity. And the pursuit is the same, whether for an unpaid half dollar or an owing thousand; the loan shark exacts the last dirty penny of her demands.

The rates of interest vary slightly among the different money-lenders, but the difference is chiefly in time allowed. If H. J. Tedman has an elastic card rate; the more instalments, the larger interest. One borrower who procured \$100 from this money-lender was forced to repay \$168. The average rate per annum would work out at about 133 1/3 per cent. If the whole sum were repaid at the end of the time, but inasmuch as it is paid off in instalments, only an expert accountant could reckon out the exact rate of interest, which begins to be paid with the first instalment, and is considerably more than 133 1/3 per cent.

The feminine person has been employed in referring to the loan shark because it is the female money-lender who monopolizes the loan business. True, there is a male capital behind her, and hidden from sight, who draws his conclusions through female managers in different cities; but the manager, the one who carries on the business and has complete control, is always a woman, either because the feminine quality of patience makes her peculiarly adapted to this occupation, or, more likely, since she can claim that forbearance from the exasperated victim which would find vent against a man, in personal assault. There is a relentless pertinacity about the methods of the money-lender which is calculated to frighten the borrower into compliance at every cost. It does frighten; overcomes and appeals him; it is like the Chinese torture of dropping water on the shaven head; but—here is the point—the borrower who has grown fearless of exposure can turn the tables upon his persecutor by taking advantage of the law, as will be shown later.

Some years ago a vigilant district-attorney drove the bulk of these money-lenders over to New Jersey, where, human nature being very similarly constituted, they have adapted themselves, and thrive. But there are numbers in New York, principally in the down-town districts, and around Nassau and Fulton streets. The average applicant now sees in there either to procure a loan or to request extension of time. It is for the latter reason his reception is remarkable. The moment that he has stated his position the woman gets up, walks to the door of her private law office, and, and leads him into the main office, where, in the presence of those who are awaiting her, she begins a violent tirade of threats and warnings, as a sublimation to all who hear her.

The borrower is required to give numerous details as to his family history, his parents' names, his educational attainments, two names of acquaintances in his place of employment, two names of personal friends, and two of tradespeople. After an interval of about two days he receives notice to call, when, if the inquiries have produced satisfactory statements, he is instructed to make over an assignment of his salary, and also in sign a power of attorney in favor of the shark, so that, in the event of his leaving his present employers, a change can be made in the name upon the papers and the name of the new employer substituted. The borrower then receives a sum in dollars and cents.

Should the money be repaid promptly, the borrower need not too soon congratulate himself on his escape. The shark is simply waiting. She knows the tendencies of human nature. Some day the victim will come back. To insure this, the shark loses little time in sending a honeyed letter of thanks to the victim, suggesting future loans, and offering a commission for every successful loan negotiated with the ex-borrower's friends through his agency or cooperation. Of course the escaped victim throws the letter away. He goes another, and then another. When the holiday season is near his attention is called to the fact that as his friends will find a small amount handy for the purposes of his vacation. These letters follow each other month after month, all ways with some reasonable reference. In fact, it may be said that,

once in the clutch of the money-lender, the victim is never free from reminders. He may have escaped, but the shadow pursues him. And, sooner or later, he generally goes back.

But if the loan be not promptly repaid the sequel of catastrophe comes like a succession of thunderbolts. Perhaps he is a day or two behindhand on an instalment merely through an inadvertence; he may escape with a small fine, but let him fail to repay, or request extension. First, comes the violent tirade at the office of the money-lender, with threats and insults. Next morning a letter arrives, which says: "If we are not paid by 5.30 this evening we will file papers and have your salary attached." An hour later he hears this threat repeated over the telephone. That afternoon a collector calls. Another letter arrives the following day, and another telephone call. Then comes the collector. And as the pursuit continues, until the debtor, harassed and broken down by these importunities, collects the money in any possible way, or loses his employment to find peace in some obscure place where he cannot be followed—so, as happens too frequently, he realizes that he is cornered and helpless and hopeless, and he kills himself.

Many loan agencies are closely affiliated and exchange lists of their victims. Many are the property of a single owner. Patterson of Brooklyn, and Wells of New York, are two in one.

And yet there is a way of escape so simple that it seems incredible that so many victims let themselves be brooded into submission rather than avail themselves of it. Here is an absolutely true version of what happened to one loan shark. It dealt with "L. G. Smith," the trading name of one of the most truculent of money-lenders. "L. G. Smith's" blunder was met with few appropriate methods, and "L. G. Smith" and only went scuttling away, but even disguised the extent of his blunder which he refused to countenance. A young man who was in urgent need of a small sum of money by reason of illness in his family, applied to "L. G. Smith" and obtained the sum of \$40.00, to be repaid in six bi-monthly instalments out of his salary, which he each by aggressive methods, and "L. G. Smith," repaid, repaid, repaid, paid, and renewed a third time, during a period of more than a year. With the payment of the fourth loan, he would have returned \$216 to the actual possession of \$162.

All this time the illness in the borrower's family continued to require constant expenditures; and at last, with some simplicity the debtor went to the loan shark in order to present the facts of the case to "L. G. Smith," and request an extension. It is hardly necessary to state that no such person exists. The owners of these usury shops are not fond of publicity. "L. G. Smith" was represented, as is the custom, by a woman, one Cora E. Raynor. When the debtor asked more time to repay, on account of his misfortune, Cora E. Raynor replied:

"If you don't pay promptly on time, you'll find your troubles only just commencing."

The borrower feeling released from moral obligations, now resolved to take advantage of his legal rights and put himself in the hands of his creditor. He paid nothing, and sat tight. Threats of a school of male and female shark agents descended upon him daily, to request payment, asking, imploring, threatening, and expelling, while every morning was heralded by a telephone call and letter of demand.

The borrower still sat tight. He had disbursed one payment on the fourth loan, and had just \$5 out on the complete transaction. A claim was then made upon his firm for his salary. This was ignored, whereupon suit was instituted by the shark for \$45, the under the contract.

By this time, appreciating the turn of affairs, Cora E. Raynor's lawyer began to propose settlement for half what was due. The law being refused, an offer to withdraw the suit was made; but this was likewise rejected without a full release. However, when the case came for trial, the judge allowed withdrawal to be made. Realizing that this would still permit Cora E. Raynor to harass the debtor with constant suits, his firm immediately instituted a return suit for \$7.00, the sum which he loaned, plus interest at the legal 6 per cent. rate of interest permitted under the laws of New York State. Judgment went by default, and a check for this amount was returned to the borrower by the loan shark.

This, as has been stated, is a true account of one highly successful transaction with a money-lender. It merely demonstrates that it is entirely possible for any one in a similar extremity to defeat the purposes of the loan shark. The law makes it a misdemeanor to lend money at any rate above 6 per cent. on personal effects, but not on salary; hence, while all interest paid in excess of this amount is recoverable, the money-lender cannot himself be made to suffer and thereby become complicitous in his own wrongdoing. Putting a much-needed amendment in the criminal law, which will put a termination to the money lender's operations as now conducted let borrowers, present and potential, who feel themselves morally released from further obligations, avail themselves of the legal limitation placed upon the rate of interest.

A Spirit in Prison*

A Novel

By Robert Richens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER XII.—(Continued.)

MONSIEUR EMILIO!"

"Vere."

The girl came towards him, a white contrast to what he had been watching. "I'm all ready. It seems so strange to be going out to a sort of party. I've had such a bother with my hair."

"You have combed," he said. "Undine has disappeared."

"What?"

"Come quite close to the lamp." She came obediently.

"Vere transfixed!" he said. "I have seen three Veres to-day already. How many more will greet me to-night?"

She laughed gently, standing quite still. Her dress and her gloves were white, but she had on a small black hat, very French, and at the back of her hair there was a broad black ribbon tied in a big bow. This ribbon marked her exact age clearly, he thought.

"This is a new frock, and my very smartest," she said; "and you dared to abuse Paris!"

"Being a man, I must retract now. You are right, we cannot do without it. But—have you an umbrella?"

"An umbrella?"

She moved and laughed again, much more gayly.

"I am serious. Come here and look at Ischia." She went with him quickly to the window.

"That blackness does look wicked. But it's a long way off."

"I think it is coming this way."

"Oh, but"—and she went to the opposite window—"the sky is perfectly clear towards Naples. And look how still the sea is."

"Too still. It is like steel."

"Eh?"

She held up her hand. They both heard a far-off sound of busy pattering on the sea.

"That must be the launch!" she said.

Her eyes were gay and expectant. It was evident that she was in high spirits, that she was looking forward to this unusual gaiety.

"Yes."

"Doesn't it sound in a hurry, as if the Marchesino was terribly afraid of being late?"

"Get your umbrella, Vere, and a waterproof. You will want them both."

At that moment Hermione came in.

"Madre, the launch is coming in a frightful hurry, and Monsieur Emilio says we must take umbrellas."

"Surely it isn't going to rain?"

"There is a thunderstorm coming up from Ischia, I believe," said Artos.

"Then we will take our cloaks in case. It is fearfully hot. I thought so when I was dressing. No doubt the launch will have a cabin."

A siren boomed.

"That is the Marchesino saluting us," cried Vere. "Come along, madre! Maria! Maria!"

She ran out, calling for the cloaks.

"Do you like Vere's frock, Emilio?" said Hermione, as they followed.

"Yes. She looks delicious,—but quite like a little woman of the world."

"Ah, you like her best as the island child. So do I. Oh, Emilio!"

"What is it?"

"I can't help it. I hate Vere's growing up."

"Few things can remain unchanged for long. This sea will be unrecognizable before we return."

Gaspere met them on the landing with solemn eyes.

"There is going to be a great storm, signora," he said. "It is coming from Ischia."

"So then Emilio thinks. But we will take wraps, and we are going in a launch. It will be all right, Gaspere."

"Shall I come with you, signora?"

"Well, Gaspere, you see it is the Marchesino's launch—" "If you would like me to come, I will ask the Signor Marchesino."

"We'll see how much room there is."

"No, signora."

He went down to receive the launch.

"Emilio," Hermione said as he disappeared, "can you understand what a comfort to me Gaspere is? Ah, if people knew how

women love those who are ready to protect them! It's quite absurd, but just because Gaspere said that, I'd fifty times rather have him with us than go without him."

"I understand. I love your watch-dog too."

She touched his arm.

"No one could ever understand the merits of a watch-dog better than you. That's right, Maria; we shall be safer with three."

The Marchesino stood at the foot of the cliff, bareheaded, to receive them. He was in evening dress, what he called "smoking," with a flower in his buttonhole, and a straw hat, and held a pair of white kid gloves in his hand. He looked in rapturous spirits, but reverential. When he caught sight of Artos on the steps behind Hermione and Vere, however, he could not repress an exclamation of "Emilio!"

He took Hermione's and Vere's hands, bowed over them and kissed them. Then he turned to his friend.

"Caro Emilio! You are back! You must come with us! You must dine at Friso's."

"May I?" said Artos.

"You must. This is delightful. See, madame," he added to Hermione, "suddenly breaking into awful French, we have the English flag! Your Jack! Your Jack, the great, the only Jack! I salute him! Let me help you!"

As Hermione stepped into the launch she said:

"I see there is plenty of room. I wonder if you would mind my taking my servant, Gaspere, to look after the cloaks and umbrellas. It seems absurd, but he says a storm is coming, and—"

"A storm!" cried the Marchesino. "Of course your Gaspere must come. Which is he?"

"There."

The Marchesino spoke to Gaspere in Italian, telling him to join the two ladies in the stern of the launch. A minute afterwards he went to him and gave him some cigarettes. Then he brought from the cabin two bouquets of flowers, and offered them to Hermione and Vere, who, with Artos, were settling themselves in the boxes. The siren sounded. They were off, cutting swiftly through the oily sea.

"A storm, signora! Cloaks and umbrellas!" said the Marchesino, shooting a glance of triumph at the one and only Friso's, whose presence to witness his success completed his enjoyment of it. "But it is a perfect night. Look at the sea. Signora, let me put the cushion a little higher behind you. It is not right. You are not perfectly comfortable. And everything must be perfect for you to-night—everything." He arranged the cushion tenderly. "The weather, too! Over, where is the storm?"

"Over Ischia," said Artos.

"It will stay there, Ischia! It is a volcano. Anything terrible may happen there."

"And Vesuvius?" said Hermione, laughing.

The Marchesino threw up his chin.

"We are going to Vesuvius. I know Naples, signora, and I promise you fine weather. We shall take our coffee after dinner outside upon the terrace at the one and only Friso's."

He chattered on gayly. His eyes were always on Vere, but he talked chiefly to Hermione, with the obvious intention of fascinating the mother in order that she might be favorably disposed towards him, and later on smile indulgently upon his flirtation with the daughter. His proceedings were carried on with a frankness that should have been disarming, and that evidently did disarm Hermione and Vere, who seemed to regard the Marchesino as a very lively boy. But Artos was almost immediately conscious of a secret irritation that threatened to spoil his evening.

The Marchesino was triumphant. Emilio had wished to prevent him from knowing these ladies. Why? Evidently because Emilio considered him dangerous. Now he knew the ladies. He was actually their host. And he meant to prove to Emilio how dangerous he could be. His eyes shot a lively defiance at his friend, then melted as they turned to Hermione, melted still more as they gazed with unavailing sentimentality into the eyes of Vere. He had no inward shyness to contend against, and was perfectly at his ease; and Artos perceived that his gaiety and cheer and direct and unreserved manner were commensurate to his companions. Vere said little, but she frequently laughed, and her face lit up with eager animation. And so, too, was quite at her ease. Artos had said that to-night she looked like a woman of the world. It was soon obvious to him that she could sustain the part she looked, and quite without affectation. The direct and direct glances of the Marchesino did not upon her innocent self-possession at all, although they began to upset the self-possession of Artos. As he sat, generally in silence, listening to the frivolous and cheerful chatter that never stopped, and

the launch cut its way through the solemn, steel-like sea towards the lights of Posillipo, he felt that he was apart because he was odd. He felt, too, that he was apart because he was clever, as if his cleverness caused loneliness. Yet only that afternoon, a few hours before, he had revelled in his powers, when he had felt that Vere was looking up to him, when he was reverencing and relying on him. This little Vere who wrote poetry about the sea!

They travelled fast. Soon the prow of the launch was directed to a darkness that lay below and to the right of a line of brilliant lights that shone close to the sea; and a bay dressed in white, belling a swinging lantern, and standing, like a statue, in a small niche of rock almost flush with the water, hailed them, caught the guavale of the launch with one hand, and brought it close in to the wall that towered above them.

"Do we get out here? But where do we go?" said Hermione.

"There is a staircase. Let us—"

The Marchesino was out in a moment and helped them all to land. He called to the waiters that he would send down food and wine to them and Gaspare. Then, piloted by the boy with the lantern, they walked up carefully through dark passages and over creaking stairs, turned to the left, and came out upon a small terrace above the sea and facing the curving lanes of Naples.

Just beyond was a long restaurant, lined with great windows on one side and with mirrors on the other, and blazing with light.

"Ecco!" cried the Marchesino. "Ecco to Scoglio di Friso! And here is the padrone!" he added, as a small, bright-eyed man, with a military figure and fierce moustaches, came briskly forward to receive them.

CHAPTER XIII

The dinner, which was served at a table strewn with red varnishes close to an open window, was a gay one, despite Artos. It could hardly have been otherwise with a host so complacent, so attentive, so self-possessed, so hilarious as the Marchesino. And the padrone of the restaurant warmly seconded the efforts of the giver of the feast. He hovered perpetually, but always discreetly, near, watchfully directing the middle-aged waiters in their duties, smiling to show his teeth, armed with tobacco pipes, or drawing delectably close to relate anecdotes connected with the menu.

The soup, a "zuppa di pesce alla marinara" remarkable for its beautiful red color, had been originally invented by the chef of Friso's for the ex-Queen Nathalie of Serbia, who had been obliged to come, heavily veiled, to lunch at the Scoglio, and had finally thrown off her veil and her incognito, and written her name in the visitors' book for all to see. The menu of the Empress had been the favorite plot of the dead Empress Elizabeth of Austria, who used to visit Friso's day after day, and who always demanded two courses of oysters, and a "Fassullo, finissimo," and a "funicula!" William Ewart Gladstone had deigned to praise the "crafs" in Friso's, called herewith by his name, when he walked over from the Villa Reale to breakfast; and the delicious punch served before the dinner, and immediately after the "pollo patate alla Friso," had been lauded by the late Czar of All the Russias, who was drinking a glass of it—according to the solemn narration of the padrone—when the telegram announcing the assassination of his father was put into his hand.

Names of very varied popular and great ones of the earth flamed about the table. Here, it appeared, Mario Costa and Paolo Tosti had composed their most celebrated songs between one course and another. Here Zola and Tolstoi had written. Here Sarah Bernhardt had ordered a dozen bottles of famous old wine to be sent to the Aveau Perire from the cellars of Friso's, and had fallen in love with a cat from Greece. Here Mariette Seran had penned a lasting testimony to the marital fidelity of her husband.

Everything—everything had happened here, just here, at Friso's. Seeing the amazed interest of his guests, the Marchesino encouraged the padrone to talk, culled for his most noted wines, and demanded at dessert a jug of Asti Spumante, with snow in it, and strawberries on the top.

"You approve of Friso's, signorina?" he said, bending towards Vere.

"You do not find your evening dull?"

The girl shook her head. A certain excitement was noticeable in her gaiety—had been noticed by her mother all through the evening. It was really due to the afternoon's indiscretions of Artos, succeeded by this unexpected festival, in which the lively bonnage of the Marchesino was mingled with the long procession of celebrated names introduced by the padrone. Vere was secretly stringing up, had been stringing up even before she stepped into the launch. She felt very happy, but in her happiness there was something feverish, which was not customary to any mood of hers. She never drank wine, and had taken none tonight, yet as the evening wore on she was conscious of an overexcitement, as if her brain were full of winking bulbs, such as rise to the surface of champagne.

Her imagination was almost furiously alive; and as the padrone talked, waving his hands and striking postures like those of a military dictator, she saw the dead Empress, with her fan before her face, nodding her head to the jig of "Fassullo, finissimo," while she watched the red cloak from Venetian rigidity into the starry sky; she saw Sarah Bernhardt taking the Greek exit upon her knee; the newly made Czar reading the telegram with his glass of punch before him; Tosti tracing lines of music; Gladstone watching the sea; and finally the guest figure and the long head of Tolstoi leaning over the book in which he wrote clearly so many years ago. "Vedi Napoli e poi muori!"

"Monsieur Emilio, you must write in the wonderful book of

—she exclaimed.

"We will all write, signorina!" cried the Marchesino. "Bring the book, Signor Mascella!"

The padrone hastened away to fetch it, but Vere shook her head.

"No, no, we must not write! We are nobodies. Monsieur Emilio is a great man. Only he is worthy of such a book. Let it be so, madre!"

Artos felt the color flush to his face at this unexpected remark of the girl. He had been distant during the dinner, certainly neither brilliant nor amusing, despite his efforts to seem talkative and cheerful. A depression had weighed upon him, as it had weighed upon him in the launch during the voyage from the island. He had felt as if he were apart, even almost as if he were *dròp*. Had Vere noticed it? Was that the reason of this sudden and charming demonstration in his favor?

He looked across at her, longing to know. But she was arguing gayly with the Marchesino, who continued to insist that they must all write their names as a souvenir of the occasion.

"We are nobodies," she repeated.

"You dare to say that you are a nobody?" exclaimed the young man, looking at her with ardent eyes. "An signorina, you do wrong to drink no wine. In wine there is truth, they say. But you—you drink water, and then you say these dreadful things that are not—are not true. Emilio!" he suddenly appealed to Artos, "would not the signorina honor any book by writing her name in it? I ask you, if—"

"The Marchesino, don't be ridiculous!" said Vere, with sudden petulance. "Don't ask Monsieur Emilio absurd questions!"

"But he thinks as I do. Emilio, is it not so? Is it not as honor for any book to have the signorina's name?"

He spoke emphatically and looked really in earnest. Artos felt as if he were listening to a silly boy who understood nothing.

"Let us all write our names," he said. "Here comes the book."

The padrone bore it grandly down between the mirrors and the windows.

But Vere suddenly got up.

"I won't write my name," she said, sticking out her chin with the little defiant air that was sometimes characteristic of her.

"I am going to see what Gaspare and the waiters are doing."

And she walked quickly away towards the terrace.

The Marchesino sprang up in despair.

"Shall we all go, madame?" he said. "I have ordered coffee. It will be brought in a moment to the terrace."

Hermione glanced at Artos.

"I will stay here for a little. I want to look at the book," she said.

"Then—we will be upon the terrace. A riverbed per un momento—pour un moment, madame."

He bowed over Hermione's hand, and hurried away after Vere.

The padrone put his book upon the table, and the Marchesino and Artos, and left them with a murmured apology that he had to look after another party of guests which had just come into the restaurant.

"I thought you would be glad to get rid of those young things for a minute," said Hermione, in explanation of what she had done.

Artos did not reply, but turned over the leaves of the book mechanically.

"Oh, here is Tolstoi's signature," he said, stopping.

Hermione drew her chair nearer.

"What a clear handwriting!" she said.

"Yes, isn't it?" "Vedi Napoli e poi muori!"

"Where are you going to write?"

He was looking towards the outer room of the restaurant which led on to the terrace.

He turned the leaves.

"It's—oh—here is a space."

He took up a pen the padrone had brought, dipped it into the ink.

"What's the good?" he said, making a movement as if to push the book away.

"No, do write."

"Why should I?"

"I agree with Vere. Your name will add something worth having to the book."

"Oh, well—"

A rather bitter expression had come into his face.

"Dear Sea fra!" he muttered.

But he bent, wrote swiftly and quickly, signed his name, blotted and shut the book. Hermione had not been able to see the sentence he had written. He did not ask what it was.

There was a noise of rather shuffling footsteps on the paved floor of the room. Three musicians had come in. They were shabbily dressed. One was very short, stout, and quite blind, with a graying wig that had an odd resemblance to an elephant's mouth when it lifts its trunk and shows its rolling tongue. He smiled perpetually. The other two were thin and decrepit, middle-aged, and hopeless-looking. They stood not far from the table and began to play on guitars, putting wrong harmonies to a well-known Neapolitan tune, whose name Artos could not recall.

"What a pity it is they never put the right hand!" said Hermione.

"Yes. One would suppose they would hit it sometimes by accident. But they seldom do."

Except for the thin and uncertain music the restaurant was almost dead. The people who had just come in were sitting down for ever at the end of the long room. The scholars and Artos were the only other visitors, now that Vere and the Marchesino were outside on the terrace.

"Famous though it is, Frisio's does not draw the crowd," said Hermione.

"Tonight she found it oddly difficult to talk to her friend, although she had refused the Marchese's invitation on purpose to do so.

"Perhaps people were afraid of the storm."

"Well, but it doesn't come!"

"It is close," he said. "Don't you feel it? I do."

His voice was heavy with melancholy, and made her feel sad, even apprehensive.

"Where are the stars?" he asked.

She followed his example and looked out of the great window, Nor a star was visible in all the sky.

"You are right. It is coming. I feel it now. The sea is like lead, and the sky too. There is no sense of freedom to-night, no out-of-doors feeling. And the water is horribly calm."

As they both leaned out they heard, away to the left at some distance, the voices of Vere and the Marchese.

"I stayed because I thought—I fancied all the chatter was getting a little on your nerves, Emile," Hermione said now. "They are as absurdly young, both of them. Wasn't it so?"

"Am I so old that youth should get upon my nerves?" he returned, with a mocking irritation, which, however, he tried to keep out of his voice.

"No. But of course we can hardly enjoy nonsense that might amuse them immensely. Vere is such a baby, and your friend is a regular boy, in spite of his self-assurance."

"Women often fancy men to be young in ways in which they are not young," said Artola.

"Fanned is very much of a man, I can assure you."

"Fanned! I never heard you call him that before."

Her copper brown eyes went to his face curiously for a moment.

Artola saw that, and said, rather hastily:

"It's true that nearly every one calls him Doro."

Once more they heard the chattering voices, and then a sound of laughter in the darkness. It made Hermione smile, but Artola moved anxiously. Just then there came to them from the sea, like a blow, a sudden puff of wind. It hit their faces.

"Do you want to avoid the storm?" Artola said.

"Yes, he said."

"I am sure you can only avoid it by going at once. Look!"

He pointed towards the sea. The blackness before them was cut at some distance off by a long, level line of white.

"What's that?" asked Hermione, peering out.

"Fog."

"Fog! But surely it can't be!"

The wind struck them again. It was like a hot, almost like a

stinging hand, coarse and violent and repugnant.

Hermione drew in.

"There is something disgusting in nature to-night," she said.

"Something that seems almost unnatural."

The blind man began to stand behind them. His voice was soft and throaty. The phrasing was sickly. Some notes trembled. As he sang he threw back his head, stared with his sightless eyes at the ceiling, and showed his tongue. The whole of his fat body swayed. His face became scarlet. The two hopeless middle-aged men on either side of him stared in vacancy as, with dirty hands on which the veins stood out, they played wrong basses to the melody on their guitars.

Suddenly Hermione was seized with a sensation of fear.

"Let us go. We had better go. Ah!"

She cried out. The wind, retreating, had caught the white table cloth. It flew up towards her, then sank down.

"What a fool I am!" she said. "I thought—I didn't know—"

She felt that really it was something in Artola which had upset her nerves, but she did not say so. At that moment, when she was startled, she had instinctively put out her hand towards him. But, as instinctively, she drew it back without touching him.

"Oh, here is Gaspare!" she said.

An immense, a really ridiculous sense of relief came to her as she saw Gaspare's sturdy legs marching decisively towards them, his great eyes examining the row of mirrors, the tables, the musicians, then settling comfortably upon his padrona. Over his arms he carried the clocks, and his hands grasped the two umbrellas. At that moment, if she had translated her impulse into action,

Hermione would have given Gaspare a good hug—just for being himself; for being always the same—honest, waterfowl, perfectly fearless, perfectly natural, and perfectly determined to take care of his padrona and his padronessa.

Afterwards she remembered that she had found in his presence relief from something that had distressed her in her friend.

"Signora, the storm is coming. Look at the sea!" said Gaspare. He pointed to the white line which was advancing in the blackness.

"I told the signorina, and that signor—"

A fierce flash of lightning zigzagged across the window space, and suddenly the sound of the wind was loud upon the sea and mingled with the growing murmur of waves.

"Look!" said Gaspare. "Signora, you ought to start at once. But the Signor Marchese—"

The thunder followed. Hermione had been waiting for it, and felt almost relieved when it came crashing above the Neuglio di Frisio.

"The Signor Marchese, Gaspare?" she asked, putting on the clock he was holding for her.

"He only laughs, signora," said Gaspare, rather contemptuously.

"The Signor Marchese thinks only of his pleasure."

"Well, he must think of yours, now," said Artola, decisively, to Hermione. "You will have a rough voyage to the island even as it is."

They were walking towards the entrance. Hermione had noticed the promontory, and said, quietly:

"You will take a carriage to the hotel, or a team?"

"The team, I think. It passes the door here."

He glanced at her and added:

"I noticed that the cabin of the launch is very small, and as Gaspare is with you—"

"Oh, of course!" she said, quickly. "It would be ridiculous for you to come all the way back with us. Besides, there is not room in the cabin."

She did not know why, but she felt guilty for a moment. Yet she had done nothing.

"There is the rain," said Artola.

They were just entering the outer room from which the terrace opened.

"Vere!" called Hermione.

As she called, the lightning flashed again, and showed her Vere and the Marchese running in from the darkness. Vere was laughing and looked more joyous than before.

"Such a storm, madre! The sea is a mass of foam. It's glorious! Hark at the fishermen!"

From the blackness below rose hoarse shouts and prolonged calls—some near, some far. Faintly with them mingled the quavering and throaty voice of the blind man, now raised in "Santa Lucia."

"What are we going to do, Monsieur Emile?"

"We must get home at once before it gets worse," said Hermione. "Marchese, I am so sorry, but I am afraid we must ask for the launch."

"But, madame, it is only a squall. By midnight it will be all over. I promise you. I am a Neapolitan."

"Ah, but you promised that there would be no storm at all."

"Ne-a-sta-lu-u-ci-a-t: Santa Lucia!"

The blind man sounded like one in agony. The thunder crashed again just above him, as if it desired to beat down his sickly voice.

Artola felt a sharp stab of neuralgia over his eyes.

Behind, in the restaurant, the waiters were running over the pavement to shut the great windows. The rush of the rain made a noise like quantities of silk rustling.

The Marchese laughed, unabashed. His cheeks were slightly flushed, and his eyes shone.

"Could I tell the truth, signora? You might have refused to come. But now I speak the solemn truth. By midnight—"

"I'm afraid we really can't stay so late as that."

"But there is a piano. I will play valves. I will sing." He looked ardently at Vere, who was eagerly watching the sea from the window.

"And we will dance, the signorina and I—"

Artola made a brusque movement towards the terrace, muttering something about the launch. A glare of lightning lit up the shore immediately below the terrace, showing him the launch buffeted by the waves that were now breaking over the sandy beach. There came a humming of cloth from the sailors.

Almost simultaneously there shone out a little steady light

"If you do stay," Arturo said to the Marchesino, turning back to them; "you must send the launch round to Mergolina. I don't believe it can stop here."

"Well, but there are rocks, caro Emilio. It is protected!"

"Not enough."

"Signora," said Gaspare, "we had better go. It will only get worse. The sea is not too bad yet."

"Come along!" Hermione cried, with decision. "Come, Vere! I'm very sorry, Marchese, but we must really get back at once. Good night, Emilio! Gaspare, give me your arm."

And she set off at once, clinging to Gaspare, who held an open umbrella over her.

"Good night, Vere!" said Arturo.

The girl was looking at him with surprised eyes.

"You are going—"

"I shall take the team."

"Oh—of course. That is your quickest way."

"Signorina—the umbrella!"

The Marchesino was offering his arm to conduct Vere to the launch. He cast a challenging look of triumph at Arturo.

"I would come in the launch," Arturo said, hastily. "But—Good night!"

He turned away.

"A rivero, Emilio!" called the Marchesino.

"—dare!"

The last syllables only came back to them through the wind and the rain.

"Take my arm, signorina."

"Gracie, it is all right like this."

"Ma—"

"I am quite covered, really, thank you."

She hurried on, smiling, but not taking his arm. She knew how to be obstinate.

"Ma, signorina—mais, mademoiselle!"

"Gaspare! Is madre all in the launch?"

Vere glided from under the Marchesino's umbrella and sought the shade of Gaspare's. Behind, the Marchesino was murmuring to himself Neapolitan street expressions.

"St. signorina."

Gaspare's face had suddenly lighted up. His padroncina's little hand was holding tightly to his strong arm.

"Take care, signorita. That is water!"

"Oh, I was nearly in. I thought—"

He almost lifted her into the launch, which was rising and falling on the waves.

"Madre! What a night!"

Vere sank down on a narrow seat of the little cabin. The Marchesino jumped aboard. The machine in the stern thrashed. They rushed forward into the blackness of the impenetrable night, the white of the leaping foam, the hissing of the rain, the roaring of the wind. In a blurred and hazy vision the lights of Frisco came before them, fell back into the storm like things defeated. Hermione fancied she saw for a second the blind man's awestruck face and open mouth, the padrone at a window waving a feeble adieu, having only just become aware of their departure. But if it were so they were gone before she knew—gone into mystery, with Emilio and the world.

The Marchesino inserted himself respectfully into the cabin. He had turned up the collar of his "smoking," and drawn the silk lapels forward over his soft shirt front. His white gloves were saturated. He came to sit down by Vere.

"Madame!" he said, respectfully, "we should have waited. The sea is too rough. Really, it is dangerous. And the signorina and I—we would have danced together."

Hermione could not help laughing, though she did not feel gay. "I should not have danced," said Vere. "I could not. I should have had to watch the storm."

She was peering out of the cabin window at the wild foam that leaped up round the little craft and disappeared in the darkness. There was no sensation of fear in her heart, only a passion of interest and an odd feeling of triumph.

To dance with the Marchesino at the Scoglio di Frisco would have been banal in comparison with this glorious progress through the night in the teeth of opposing elements. She envied Gaspare, who was outside with the sea, and when from the cockpit dimly saw, a blur against the blackness, She longed to take off her smart little hat and her French frock, and be outside, too, in the wind and the rain.

"It is ridiculous to be dressed like this!" she said, quickly taking off the glove she had put on her left hand. "You poor Marchesino!"

She looked at his damp "smoking," his soaking gloves, and deplorable expression, and could not repress a little rush of laughter.

"Do forgive me! Madre, I know I'm behaving shamefully, but we are all so hopelessly inappropriate. Your diamond brooch, madre! And your hat! All on one side! Gaspare must have knocked it with the umbrella. I am sure we all look like hens in a shower!"

She leaned back against the swaying side of the cabin and laughed till the tears were in her eyes. The sudden coming of the storm had increased the excitement that had been already within her, created by the midnight day.

"Vere!" said her mother, but smiling through the protest. The Marchesino showed his big white teeth. Everything that Vere did seemed to develop his admiration for her. He was delighted with this mood, and forgot his disappointment. But there was a glint of wonder in his eyes, and now he said:

"But the signorina is not afraid! She does not cry out! She does not call upon the Madonna and the saints! My mother, my sisters, if they were here—"

The prow of the launch struck a wave which burst over her bows, scattering spray to the roof of the cabin.

"But I like it, I love it!" said Vere. "Don't you?—don't you, madre?"

Before Hermione could reply the Marchesino exclaimed:

"Signorina, in the breast of an angel you have the heart of a lion! The sea will never harm you. How could it! It will treat you as it treats the saint of your Focol, San Francesco. You know what the sailors and the fishermen say? In the wildest storm—when the sea crashes upon the rocks, never, never, does it touch San Francesco. Never does it put out the lamp that burns at San Francesco's feet."

"Yes, I have heard them say that," Vere said.

Suddenly her face had become serious. The romance in the belief of the women had got hold of her, had touched her. The compliment to herself she ignored. Indeed, she had already forgotten it.

"Only the other night—" she began.

But she stopped suddenly.

"You know," she said, changing to something else, "that when the fishermen pass under San Francesco's pedestal they bend down and lift a little water from the sea, and sprinkle it into the boat, and make the sign of the cross. They call it 'acqua benedetta.' I love to see them do that."

Another big wave struck the launch and made it shiver. The Marchesino crossed himself, but quite mechanically. He was intent on Vere.

"I wonder," the girl said, "whether to-night San Francesco will not be beaten by the waves, whether his light will be burning when we reach the island?"

She paused, then she added in a lower voice:

"I do hope it will—don't you, madre?"

"Yes, Vere," said her mother.

Something in her mother's voice made the girl look up at her swiftly, then put a hand into hers, a hand that was all sympathy. She felt that then her mother's imagination was almost, or quite, one with hers. The lights of Naples were gone, swallowed by the blackness of the storm. And the tiny light at the feet of the saint, of San Francesco, who protected the men of the sea, and the boys—Ruffo, too!—would it greet them, star of the sea to their Focol, star of the sea to their island, their Casa del Mare, when they had battled through the storm to San Francesco's feet? "I do hope it will."

Why did Hermione's heart echo Vere's words with such a strenuous and sudden passion, such a deep desire? She scarcely knew then. But she knew that she wanted a light to be shining for her when she reached home—longer for it, needed it specially that night. If San Francesco's lamp were burning quietly amid the fury of the sea in such a blackness as this about them—well, it would seem like an omen. She would take it as an omen of happiness.

And if it were not burning?

She, too, longed to be outside with Gaspare and the sailors, staring into the darkness, with eyes keen as those of a seaman, looking for the light. Since Vere's last words and her reply they had sat in silence. Even the Marchesino's vivacity was suddenly muted, either by the increasing violence of the storm or by the change in Vere. It would have been difficult to say by which. The lightning flashed. The thunder at moments seemed to split the sky asunder, as a charge of gunpowder split a rock. The head wind rushed by, yet had never passed them, but was forever coming furiously to meet them. On the roof of the little cabin the rain made a noise that was no longer like the rustle of silk, but was like the crumble of misery.

There was something oppressive, something even almost terrible, in being closely confined, shut in by low roof and narrow walls from such sweeping turbulence, such a clamor of wind and water and the sky.

Hermione looked at her diamond brooch, then at her cloak.

Slowly she lifted her head and began to button it.

Very moved and began to button up hers. Hermione glanced at her, and saw a watchful, shining, half humorous, half passionate look in her eyes that could not be mistaken.

She dropped her hands.

"No, Vere!"

"Yes, madre! Yes, yes!"

The Marchesino stared.

"No, I did not."

"You did! You did, madre! It's so me! I understood directly."

She began quickly to take off her hat.

"Marchese, we are going out."

"Vere, this is absurd."

"We are going outside, Marchese. Madre wants air."

The Marchesino, accustomed only to the habits and customs of Neapolitan women, looked frankly as if he thought Hermione mad.

"Poor madre must have a breath of air."

"I will open the window, signora!"

"And the rain all over her, and the thunder close above her, and the sea in her face, the sea—the sea!"

She dropped her hands.

"Gaspare! Gaspare!"

She put her face to the glass. Gaspare, who was standing up in the stern, with his hands holding fast to the rail that edged the cabin roof, bent down till his brown face was on a level with hers, and his big eyes were staring inquisitively into her eyes.

"We are coming out."

On the other side of the glass Gaspare made violently negative

(Continued on page 28.)

Our Unknown World

There is still plenty of work for explorers. In spite of the remarkable discoveries effected during the second half of the nineteenth century, vast portions of this globe have still to disclose their secrets. And it must be remembered that the beeline journey which a Stanley makes across Africa or a Burton through Brazil really leaves those countries practically as undiscovered as before the journey was made.

The Conspiracy of the Map-makers

In fact, it may be said that while the courses of the great African rivers and of the equatorial lakes were traced more or less accurately by Burton, Speke, Baker, and the rest of that galaxy of mid-Victorian explorers, the interior of the continent of Africa would remain pretty well as they have been since the dawn of planetary life. That popular opinion should hold otherwise is due to a conspiracy of mappmakers. Examine any old map of a century ago. Turn to the great African continent. Look at the Niger, which really makes a head at right angles to itself, so that its whole course sweeps in a semicircle round the west coast of Africa, is brazenly depicted as flowing straight across the continent, and joining the great equatorial lakes. Look at the Nile, actually a source. The same officious is manifest to-day. Africa, the "dark continent," is scarcely whiter then before it was divided among the Powers of Europe. In fact, old Portuguese maps of three centuries ago displaying with perfect accuracy the Nile, the Niger, and the equatorial lakes, which were forgotten and not shown on maps of the early nineteenth century. West of the Sudan are vast negro kingdoms civilized by the rapidly spreading Mohammedanism of the present day, and possessing the same agriculture, and showing evidence of considerable civil development, but these are only a rumor to the officials of the European colonies which border them. And even in countries such as the Transvaal—even in Cape Colony—where the reputation has not been so completely repudiated. Very fit, which shows so bravely upon the map in British red, is really a tiny strip of territory *some* thirty miles in width, on either side of which lies unknown desert haunted by predatory tribes. The vast territory of the interior of Africa, from the Atlantic through the Sahara and thence into Arabia, the home of the Bedouins who cramped all northern Africa, with Algeria, Morocco, Spain, Portugal, and half of France, and may do so again, is still an unknown waste, and in the earliest times of the Aborigine empire, from Babylon to India, a waste empire.

In Darkest Europe

In Europe little or nothing is known of Altaya, Mientenggo, and the mountainous districts of the Balkans. In Asia, the whole northern portion of Siberia is unexplored. The northeast passage has been made by the Russians, but no one has yet reached the east of Siberia in a daringly presented open map as though its configurations had been surveyed by careful prosely. Outside the railroad and the course of the streams the whole of Siberia is an unknown forested expanse. The desert which lies between the third and fourth parallels is particularly new territory. Phyllostoma unknown to us may yet be found. Sven Hedin, the Swedish explorer, has already discovered evidences of man among the monasteries of the Buddhist monks from which he has procured manuscripts. Scattered still is the vast tableland of Tibet, with its mysterious capital, Lhasa, ruled by an emperor-pope, a city which was seen but once during the nineteenth century by western travellers previous to the English military expedition of a part of the British army. Driven back to the foot-slope of the great Irawaddy River has not been found; nor do we know anything worth recording of the interior of Siam, the hill-tribes of the South Chinese frontier, French Cochinchina, or the jungles of Malakka, where the white men have never set their feet. In fact, it still seems almost

Fields for the Explorer

The East Indies are almost totally unknown. New Guinea, the fourth largest

island in the world, Bernier, with its headwaters, the table-top mountains, its isolated heights by wandering head-hunters or petty Mohammedan potentates, who have strenuously resisted the encroachments of their Dutch conquerors for centuries. The entire central portion of Australia is an unknown desert, crossed in one portion by the trans-continental telegraph line, but totally unexplored outside the small parallel strip of territory which borders it. Those who remember the great El Dorado fraud of a few years back, when the marvellous stories of the pseudo-Australian discoverer were greedily swallowed by the Royal Geographical Society, may bear witness to the

trach of this, the Amazon continent greatly superior in this respect to those of the lesser world. Three-fifths of Canada is a wilderness of marsh and tundra. The southern half of Florida is still the haunt of Indians, who live there much as in De Soto's time. Palm-land and the most fashionable resorts of the United States are still the haunts of the Indian along the edge of a pitiless wilderness of mangrove-swamps. Mexico, Lower California, and the Northwest are still possessed chiefly by unsouthern Indians, as is the interior of Yucatan; the peninsula which joins Central America to the continent is still the haunt of the Aztec still dwell in the recesses of the jungle. The vast interior of Brazil is given over to roving tribes of cannibalistic tendencies, whose own interiors are often repelled by the rubber-patrollers that hunt the last link of the streams in their search for the black gold of the Amazon.

When we add to these regions the enormous continent around the south polar regions whose existence, dimly conceived by the first travellers of fifty years ago, was only demonstrated during the first years of the twentieth century, and where new forms of life and even new races may possibly be found, it becomes evident that there are explorations still to be made before adventurous spirits turn their attention to the coasts of Mars and the Saturnian rings.

The New Duke of Devonshire

Thus Duke of Devonshire passed an adolescence when the late Duke was accustomed to regret had been dealt himself—he was sent to a public school, though at an age rather more mature than the rule at Eton. He also is the first Duke who has not been a soldier, though he was at first like to creep a stool in a city office. The present Duke has had a term in a city accountant's business, which is a preparation for public life not possible in a country family. The Duke began his Parliamentary business when he was twenty-three years of age, when he was, probably, the youngest member of the House of Commons. The first time he was elected, his opponent's stool was to come later, when he was appointed to the Financial Secretaryship of the Treasury. He is a much more serious man than was his uncle, being, among other things, a member of the first company. Chatsworth, the Duke's county seat, stands in a park twelve miles in circumference. The social and historical associations of Chatsworth have been accumulated by the Duke and his predecessors thereabouts in the way of figures.

The World's Rubber Output

The rapidly increasing price of rubber has raised the cultivation of groves of rubber-yielding trees in many parts of the world during recent years; but the bulk of the product still comes from the jungles. The Congo and Amazon valleys supply the greatest portion of the rubber crop. The most recent figures give a total of 1,000,000 tons in 1905-6 in 50,000 acres. Brazil leading in production with 400,000 tons. Belin, Central America, and Mexico gave a combined total of 1800 tons. Africa, 21,000 tons and the balance came from Asia and the East Indies. Of the amount obtained in Africa the Congo Free State gave 1,000 tons; French Congo, 1,000 tons; Angola, 4500 tons; French Guinea, 1,300 tons; Angola, 12,500; and the Gold Coast, 10,000 tons.

The Congo Free State has commenced the planting of rubber groves. At present it is estimated that fully 13,000,000 plants have been set out, capable of producing, within a few years, and at a low estimate, 650 tons of rubber annually. Independent of this successive planting, the State has established three grand groves of rubber cultivation, each of 250,000 acres. When the entire area of 750,000 acres provided for has been planted, the yield after six years is expected to be 9750 tons annually, or nearly double the present production, and this without calculating the 13,000,000 trees already started, nor the number which is constantly being planted.

The Japanese Horror of Milk

There was a time when milk was regarded in Japan with the same abhorrence as cheese in China. Recent statistics, however, show that time has worked a great change in this respect, and milk and butter are now in great favor in Japan. Whereas twenty-five years ago not more than one or two per cent. of the persons visiting a European restaurant, or eating a European meal at a friend's house, would have thought of touching butter, fifty forty or fifty per cent. now eat it with a relish. They are, however, quite content to do without it.

Dairy farms have increased notably in recent years. Unlike, however, in a by-product at these places. It is to milk that they look for their profit. Milk has a curious history in Japan. Thirty or forty years ago it was abhorred. The average Japanese, even today, dislikes drinking it. But today many a household consumes one or two bottles of milk daily, partly because people have come to like it and partly because the doctors have recommended it as a unique and wholesome beverage. "Milk bells," too, are now quite numerous. There is probably tea much longer to come widely into vogue than milk and penicillin. A pound of fresh butter costs at least one yen (400 cents, gold) in Tokyo today, an extremely high price for Japan.

A PERFECT MILK SUPPLY

should have a quantity of gurrin. The same 'Nawwan' granulation exists in milk products. However, Friesland Foods Evaporated Milk (www.evapormilk.com) prepared whole creamers and purty when required. Use it in all regions calling for milk.

THE REST ALL ROUND FAMILY LINIMENT is "BROWN'S HOUSEHOLD PANACEA," 3¢ cents a bottle. **W.B.**

TRAINED NURSE

Remarks about Nourishing Food

"A physician's wife gave me a package of Grape-Nuts one day, with the remark that she was sure I would find the food very beneficial, both for my own use and for my patients. I was particularly attracted to the food, as at that time the weather was very hot, and I appreciated the fact that Grape-Nuts requires no cooking.

"The food was deliciously crisp, and most inviting to the appetite. After making use of it twice a day for three or four weeks, I discovered that it was a most wonderful invigorator. I used to suffer greatly from exhaustion, headaches, and depression of spirits. My work had been very trying at times, and indigestion had set in.

"Now I am always well and ready for any amount of work, have an abundance of native energy, cheerfulness, and mental poise. I have proved to my entire satisfaction that this change has been brought about by Grape-Nuts food."

"The fact that it is predigested is a very desirable feature. I have had many remarkable results in feeding Grace Nuts to my patients, and I cannot speak too highly of the food. My friends constantly comment on the change in my appearance. I have gained 9 pounds since beginning the use of this food." —There's a Story.

Ever read the above letter? A new one appears from time to time. They are genuine, true, and full of human interest.

A SPIRIT IN PRISON

(Continued from page 25.)

gestures. One word only came to those inside the cabin through the uproar of the elements.

"Impossible!"

"Signorina," said the Marchesino, "you cannot mean it. But you will be washed off. And the water—you will be drowned. It cannot be."

"Marchese, look at madre! If she stays inside another minute she will be ill. She is stifling! Quickly! Quickly!"

The Marchesino, whose sense of humor was not of a kind to comprehend this freak of Vere's, was for once really taken aback. There were two sliding doors to the cabin, one opening into the bow of the launch, the other into the stern. He got up, looking very grave and rather confused, and opened the former. The wind rushed in, carrying with it spray from the sea. At the same moment there was a loud tapping on the glass behind them. Vere looked round. Gaspare was crowding down with his face against the pane. She put her ear to the glass by his mouth.

"Signorina, you must not go into the bow," he called. "If you will come out, come here, and I will take care of you."

"He knew Vere's love of the sea and understood her desire."

"Go, Vere," said Hermione.

The Marchesino shut the door, and stood by it, bending and looking doubtful.

"I will stay here with the Marchese. I am really too old to face such a tempest, and the Marchese has no coat. He simply can't go."

"But, signora, it does not matter. I am ready."

"Impossible. Your clothes would be ruined. Go along, Vere! Turn up your collar."

She spoke almost as if to a boy, and like a gay boy Vere obeyed her and slipped out to Gaspare.

"You really won't come, madre?"

"No. But—tell me if you see the light."

The girl nodded, and the door moved into its place, shutting out the wind.

Then the Marchesino sat down and looked at his damp patent leather boots.

He really could not comprehend these English ladies. That Vere was greatly attracted by him he thoroughly believed. How could it be otherwise? Her littleness he considered direct encouragement. And then she had gone out to the terrace after dinner, leaving her mother. That was to make him follow her, of course. She wanted to be alone with him. In a Neapolitan girl such conduct would have been a declaration. A Neapolitan mother would not have allowed three to sit together on the terrace without a chaperon. But the English mother had deliberately remained within and had kept close to Emilia with her. What could such conduct mean, if not that the signorina was in love with him, the Marchesino, and that the signorina's mamma was perfectly willing for him to make love to her child?

And yet—and yet?

There was something in Vere that puzzled him, that had kept him strangely discreet upon the terrace, that made him silent and thoughtful now. Had she been a typical English girl he might have discerned something of the truth of her. But Vere was lively, daring, passionate, and not without some traces of half humor and wholly innocent coquetry. She was not at all what the Neapolitan calls "a lump of snow to cool the wine." In her innocence there was fire. That was what confused the Marchesino.

He stared at the cabin door by which Vere had gone out, and his round eyes became almost pathetic for a moment. There it occurred to him that perhaps this exit was a second rose, like Vere's departure to the terrace, and he made a movement as if he were to go out and leave the storm. But Hermione stopped him decisively.

"No, Marchese," she said, "really I cannot let you expose yourself to the rain and the sea in that airy costume. I might be your mother."

"Signorina, but you—"

"No, compliments apart, I really might be, and you must let me use a mother's authority. Tell me reach the island stay here and make the best of me."

Hermione had touched the right note. Metaphorically the Marchesino cast himself at her feet. With a gallant assumption of undivided attention he burst into conversation, and, though his eyes often wandered to the blurred glass, against which pressed and swayed a blackness that told of those outside, his sense of his duty as a host gradually prevailed, and he and Hermione were soon talking quite cheerfully together.

Vere had forgotten him as utterly as she had forgotten Naples, swallowed up by the night. Just then only the sea, the night, Gaspare, and the two sailors who were emulating the launch were real to her—besides herself. For a moment even her mother had ceased to exist in her consciousness. As the sea swept the deck of the little craft it swept her mind clear to make room for itself.

She stood by Gaspare, touching him, and clinging on, as he did,

to the rail. Impenetrably black was the night. Only here and there, at distances she could not begin to judge of, shone vaguely lights that seemed to dance and fade and reappear like marsh lights in a world of mist. Were they on sea or land? She could not tell and she did not ask. The sailors doubtless knew, but she rejected them and their duty too much to speak to them, though she had given them a smile as she came out to join them, and had received two admiring salutes in reply. Gaspare, too, had smiled at her with a pleasure which softly conquered the faint reproach in his eloquent eyes. He liked his patroness's courage, liked the sailors of the Signor Marchese to see it. He was soaked to the skin, but he, too, was enjoying the adventure, a rare one on this summer sea, which had slept through so many shining days and starry nights like a "lambino in dove legera."

To-night it was awake, and woke up others, Vere's nature and his.

"Where is the island, Gaspare?" cried Vere through the wind to him.

"Oh! In so, signorina."

He waved one hand to the blackness before them.

"It must be there."

She strained her eyes, then looked away towards where the land must be. At a long distance across the leaping foam she saw one light. As the boat rose and sank on the crests and into the hollows of the waves the light shone and faded, shone and faded. She guessed it to be a light at the Antico Giuseppino. Despite the head wind and the waves that met them, the launch travelled bravely, and soon the light was gone. She told herself that it must have been at the Giuseppino, and that now they had got beyond the point, and were opposite to the harbor of the Villa Rossa. But no lights greeted them from the White Palace in the wood, or from the smaller white houses low down beside the sea. And again she looked straight forward.

Now she was latent on San Francesco. She was thinking of him, of the Pool, of the Island. And she thrilled with joy at the thought of the wonderful wildness of her home. As they drew on towards it the waves were bigger, the wind was stronger. Even on calm nights there was always a breeze when one had passed the Giuseppino going towards Ischia, and beyond the island there was sometimes quite a lively sea. What would it be to-night? Her heart cried out for a crescent. Within her, at that moment, was a desire like the mother's for speed. More! more! More! what more was more than the more of this terrible blackness! Had not been dashed from his pedestal by the waves? Was the light at his feet still burning?

"It wants!" she said to Gaspare.

He bent his head till it rested close to her lips.

"It wants! What has become of his light?"

"He will be there, signorina."

No Gaspare, too, held to the belief of the women of the bay. He had confidence in the omniscience of the sea, this sea that roared around them like a tyrant. Suddenly he had no doubt. It would be so. The saint would be untouchable. The light would still be burning. She looked for it. And now she remembered her mother. She must tell her mother directly she saw it. But all was blackness still.

And the launch seemed weary, like a tire thing whose strength is ebbing, who strains and pants and struggles gallantly, not losing heart, but losing physical force. Surely it was going slower. She laid one hand upon the cabin roof as if in encouragement. Her heart was with the launch, as the woman's is with his boat when it resists, surely for his sake consciously, the assault of the great sea.

"Coraggio!"

She was murmuring the word, Gaspare looked at her. And the word was in his eyes as it should be in all eyes that look at youth.

And the launch strove on.

"Coraggio! Coraggio!"

The spray was in her face. Her hair was wet with the rain. Her French frock—she was probably ruined—she knew that she had never felt more happy. And now—it was like a miracle! Suddenly out of the darkness a second darkness shaped itself, a darkness that she knew—the island. And almost simultaneously there shone out a little steady light.

"Ecco il santo!"

"Ecco! Ecco!"

Vere called out.

"Madre! Madre!"

She bent down.

"Madre! The light is burning."

The sailors, too, bent down, right down to the water. They caught at it with their hands; Gaspare, too, Vere understood, and, kneeling on the gunwale, firmly in Gaspare's grasp, she joined in their action.

She exhibited the boat with organ brackets and made the sign of the cross.

(To be Continued.)

The American Civil Service Army

The total number of employees in the executive civil service, on the occasion of their last enumeration, exclusive of the consular and diplomatic service, was 286,902; and of this number 251,403 were employed at the national capital. The total here may be divided into six main classes: clerical, 122,456; subclerical and manual labor, 37,097; professional, technical, and scientific, 5,735; executive, 1,137; miscellaneous, 5,443. Practically two-thirds of the government employees are thus engaged in clerical work. The next largest class is formed by those whose work is subclerical and manual. These two classes together include 80 per cent. of all the employees. None of the remaining classes is large, the percentage they constitute of the total varying from 1.2 for the executive, the smallest class, to 3.2 for the professional, technical, and scientific.

The median ages of the employees in these occupation classes are as follows: clerical, 35.5; professional, technical, and scientific, 39.1; subclerical and manual labor, 37.7; miscellaneous, 35.1; miscellaneous, 31.7; and executive, 49.1.

There were no fewer than 62,043 postmasters, 18,376 mailmen and laborers in navy yards and naval stations, 12,850 clerks in post offices not having free delivery, and 1,031 occasional employees of the Weather Bureau, besides 4,544 employed in the work at the Indian Civil Commission.

Omitting these latter classes, of the total number of government employees, 130,021, or 51.9 per cent., are native whites; 18,253, or 16 per cent., foreign-born whites; and 11,318, or 6.1 per cent., colored. Of the colored, 8,332 are negroes, 1,725 Indians, 1,017 Filipinos, 142 Chinese, and 42 Japanese. In the District of Columbia, 2,745 of the employees are negroes. That is to say, at the national capital one government employee in ten is a negro.

One-half of all employees are under 36.5 years of age. In the District of Columbia the median age is slightly higher, being 38.8 years, while elsewhere it is but 36.2.

The advanced age periods are, however, more interesting than the median. The figures show that the government employs in the civil service 4,264 persons from 65 to 69 years of age; 1,357 from 70 to 74 years; 436 from 75 to 79 years; and 137 of least 80 years of age. These figures give a total of 6,252 employees in the executive civil service who are 65 years of age or over. Of this number, 1,852 are employed in the District of Columbia and 4,401 elsewhere.

There are 106,811 persons employed in the Post Office Department. The figures include 52,280 mail delivery carriers, 28,846 clerks in classified offices, 24,096 letter carriers, and 12,892 railway mail clerks. The 62,043 postmasters and 12,850 clerks are not included in these figures. If these are added it will be found that the total number engaged in handling the mail of the country is 140,356.

New York ranks first in the number of its employees in the executive civil service, reporting 22,467, or 12.1 per cent. of the total number; Pennsylvania ranks second, with 14,627, or 7.9 per cent.; Illinois, third, with 13,406, or 7.2 per cent.; and Massachusetts, fourth, with 9,368, or 5.2 per cent.

The approximate average rates of compensation for different classes of employees are as follows: executive, \$1,983; professional, technical, and scientific, \$1,273; miscellaneous, \$1,221; mechanical, \$959; clerical, \$693; and subclerical and manual labor, \$711. In the clerical class, it is interesting to note, the approximate average compensation for women (\$950) is practically the same as that for men (\$953).

Civil service employees amounting in number to 15,267, or 8.2 per cent. of the total number, reported that they were war veterans. Of these veterans 8,464 had served in the Civil War, and 6,743 in the war with Spain. The total number of employees at least 60 years of age is 13,263, and of this number 7,706, or 58.1 per cent., are war veterans. Roughly speaking, therefore, among every ten employees of 60 years of age and upward, six have served their country upon the battlefield.

Dissect My Razor The "GILLETTE"

Observe its convenience—it is perfection in every detail. Figure out how much time and money you can save by adopting the "Gillette" habit.

You will then know why over two million men are proclaiming the superiority of the "Gillette."

BECAUSE it gives you a clean, comfortable, safe shave in three to five minutes—no matter how inexperienced you are.

BECAUSE the hardest beard, though on the tenderest skin, willingly yields to the soft, easy action of the keen "Gillette" blade.

No Stropping—No Honing.

BECAUSE the holder lasts a lifetime.

BECAUSE its blades are so inexpensive that when dull you throw them away as you would an old pen.

King Gillette

The Gillette Safety Razor Set consists of a triple silver-plated holder, 12 double-edged flexible blades—21 base edges, packed in a velvet lined leather case, and the price is \$5.00.

Combination Sets from \$6.50 to \$50.00. Ask your dealer for the "Gillette" no-day. If subscribers are offered, return them, and write us at once for our booklet and free trial offer.

"Play Ball!"

By EARLE HOOKER EATON

That Small Boy is shrieking, "Play ball!"
Through knot-holes he's peering, "Play ball!"
With ecstatic features—
Like most rooting creatures,
At this time of year—
He's fed toward the bleachers,
Half crazy to hear
The praising, the blaming,
The fans all exclaiming,
"Play ball! Play ball!"

That Boy has he rubbers—"One strike!"
And then almost blubbers—"Two strikes!"
And fear stills his clattering,
For Slinger is baiting,
"Cheer! Will he strike out!"
His heart's pit-a-patting,
And then there's a shout,
The pitcher they're gushing,
The horsehide goes flying,
Well done! Well done!
From third Slinger's flying—"Home run!"

The Cap's movements thimble with sense.
That Boy now is climbing the fence.
He swiftly drops over,
And thinks he's in play—
The Land of the Bleat—
But naughty young rover,
He gets little red,
For while he is saying,
Concerning not paying,
"It's enclosed! It's enclosed!"
The big Cap is baying, "You're pinched!"

That Boy soon goes home with his nerve,
Salls back o'er the fence with a curse,
While rovers are cheering,
His little game's sneering,
"You're out!" "He's out!"
While rovers are jeering, "One out!"

The Hollowness of the Earth

By HERBERT DICKENSON

EVER since man first began to speculate, his poor old earth has been the butt of his investigations. He has weighed it and measured it. He has scarified and scratched it. He has plumbed it and put it in spectrometers, retorts, and test tubes. Counterspy he has been boiled and baked for it, like Giordano Bruno. Occasionally, too, the earth has retorted and lured him, or swallowed him alive.

The earth has had many hard names thrown at it. It has been called flat, spherical and oblate. But heretofore nobly has accused it of being a hollow mockery. And that is what we have come to now. We have not tried securely over a sphere eight thousand miles thick, spurring beneath our heels antipodean savages, who cling like flies, dead downward, on the opposite side. Nor are we premeditating upon a shell, within which penguins, sea serpents, four-headed dogs, and talking antbirds despite for supremacy with unicorns, griffins, and leontomastropodants.

"But there's no danger of our falling through," says William Reed, who has made this discovery. "The crust of the earth is quite five hundred miles thick. It may be less or more; it may be quite a little more."

Who is this Mr. William Reed? Is he an explorer, astronomer, or geophysicist? Has he deduced his theories from the wild and soul-stirring experiences of a morning picture operator? No. He is an insurance adjuster, and in the intervals of adjusting he has been reading stories of Arctic exploration. Why, asked Mr. Reed of Mr. Reed, has the North Pole never been found? He answered his own question. "There is no Pole. There are no Poles at all, and when the deluded polar bears try to ascend them they tangle over into the centre of the earth, where they are promptly devoured by the same predatory arthropods that boiled and served up Andrew as a *hollow oyster*. The Aurora Borealis is the reflection of the campfires of antipodean warriors, says Mr. Reed."

This is, in brief, the thought which bit him, and when he recovered he set to work, with commendable promptitude, to propagate his propaganda through the medium of the Reed Hollow Earth Exploring Club, Unlimited, headquarters 132 East Twenty-third Street, New York, America, Top West Side Hemisphere. The president is Frank M. Ashby, patent lawyer, the financial secretary Walter S. Boskey, druggist, and the correspondence secretary

"Cap," alias Captain Bradley S. Osborn, ex-admiral of the Chinese and Mexican navies, who has whaled the nine seas since '44, and eaten Fuji girl served on banana leaves, and was deposed from the imperial throne of Hooribooka because he couldn't get plump.

I went to see Mr. Reed, to hear what he might have to say as to why sentence of death should not be passed upon him, and came out with shivering brains. Reason was tittering on her unstable throne. For it is so hideously plausible, this theory of William Reed. It can't be true, because it isn't true, but there's no reason why it shouldn't be true, except that I know it couldn't be. Why shouldn't penguins and sea serpents come from the interior of the world? Why shouldn't the rotatory motion of nebulous gas have whirled everything outside, to leave a hollow globe when things cooled down?

"That's why we wear clothes, and that's how better is separated," said Mr. Reed. "Here's that crazy man coming along who thinks there's another continent over the ocean; said the monks of Columbus. Why does the north wind raise the temperature during the Arctic winter? Why did Nansen sail fifteen days through clear water and only advance one degree unless he was sailing round and round inside? Where do the seals and musk oxen go for their feeding grounds? Where do the fresh-water icebergs come from? Why do scientists treat the earth as if it were a solid and have to make out that it's three times as heavy as nickel steel in order to make their calculations fit? Why do they admit that the earth is flattened at the poles, and not go further and allow it's hollow? Why is the sun invisible so long at the north and south in winter, unless there's a depression which shuts out its light? What is the Aurora Borealis? Electric lights! Then why don't we meet it all over the earth? It's fire reflected from inside the earth. And the dust that troubles all the explorers comes from the volcanoes there. The colored snow is produced by vegetable matter blown out from the interior. The great sea pressure comes from rivers inside. The tidal waves—"

I cringed down stairs. I had gone in a sane, strong, angry man. I came out a knee-knocked, ramshackle wretch. I trod tiptoe over the pavements and skipped across coal holes. When I saw the Pennsylvania Railroad excavations I braced myself against a lamp post. Since then I have been wearing moccasins, and

Animal Friendships and Animosities

If man's ancestor had been the majestic mammoth instead of a malicious and destructive ape, the inherent fear of him which has become a hereditary instinct in nearly all animals would no doubt be absent. Wherever man comes into contact with birds and beasts which have never been molested, as in the Arctic, these display no emotions but those of curiosity and disdain.

The classic example of alliance between animals of different species is, of course, the friendship between man and dog. When to the strength and cunning of man's monkey ancestor was added the speed of the dog, an irresistible combination was secured, which ended in the peribonatic enslavement of the lower creature by man.

Birds are nothing but snakes which have evolved feathers and wings during countless millenniums. The ineradicable hatred between monkeys and snakes has been beautifully clung into the friendly tolerance between birds and men. Ovis, which are instantly mobbed by all birds should they appear in public, find friendly shelter in barns by reason of their rat-eradicating properties.

The long-legged birds, such as storks, pelicans, and cranes, have also procured immunity in most parts of the world.

Among the fishes, sharks extend a peculiar protection toward a fish of the remora family, which, too lazy to propel itself through the water, attaches itself to the larger fish by means of suction ridges upon the head.

In South Africa, where insect life is perhaps more abundant than in any other part of the world, sheep may often be seen placidly grazing, while birds of a certain species hop busily about their backs engaged in the destruction of insect parasites.

The lion, which will kill and eat nearly all species of wild game, never molests the jackal, who, slinking behind him, finishes the half eaten prey. Hunters will wear his long drawn bowl succeed the medical case of the big cat when he comes to devour his master's belongings. But the lion has an inveterate enemy in the honeybird, which will fly toward the hunter and lead him through the thick bush till he has pointed out the lion's lair, or, sometimes, a store of honey.

Dime Novels for Spain

A STRICTLY American industry successfully introduced into Spain is that of the old-fashioned dime novel. At all the newspaper kiosks French translations of the most popular of these serials have been selling rapidly for a year or more. The books retail at from 4.1 cents to about 5 American cents a copy. The chief sales were in Madrid and Barcelona. The best profits of Spanish publishers of cheap literature are earned in South and Central America, and these are now competing with American publishers in the Spanish markets.

"C-B" and His Royal Visitors

SIR HENRY CAMPBELL-BANNEMAN'S illness has, in one respect, established a record. If his predecessors in office in England (the modern times, that is), no one has been the object of such overt demonstrations of sympathy in high places. The sympathy may have been no less in other cases; the etiquette was more. Sir Henry has received the personal visit of the Sovereign, of the Heir Apparent, and of Queen Alexandra and the Empress Marie. Marks of sympathy such as this were not accorded to Melbourne, to Palmerston, to Beaconsfield, to Gladstone, or to Salisbury. Palmerston wrote to the late Queen Victoria from Broom's—where, by and by, he was to die himself—that "Victoria and Melbourne was released from further offering," and three days later the Queen returned to her uncle Leopold that "our poor old friend" was dead. And in those days, too, democratic than these, royal expressions of sympathy that took concrete form were generally posthumous, and expressed in funeral wreaths.

LIQUEUR Pères Charfreux

—GREEN AND YELLOW—

This famous cordial, now made at Tarragona, Spain, was for centuries distilled by the Carmelite Monks (Pères Charfreux) at the Monastery of La Grande Chartreuse, France, and known throughout the world as Chartreuse. The above cut represents the bottle and label employed in the past up until the time they left the Monastery of La Grande Chartreuse, and who, therefore, alone possess a knowledge of the elements of the delicious nectar. No liqueur associated with the name of the Carmelite Monks (Pères Charfreux) and made since their expulsion from France is genuine except that made by them at Tarragona, Spain.

"Better than
THE SPOILERS"

THE BARRIER

FIRST of all, this new novel by Rex Beach is a big, buoyant, bracing story of the last frontier—Alaska—a story to equal "The Spoilers" in every way. This is one half of **THE BARRIER**. The other half is its triumphant love drama. In this the new book surpasses "The Spoilers."

By
REX BEACH
Author of
THE SPOILERS

In **THE BARRIER** there is a new setting, too, but still in the virile air of the North. The new people whom Mr. Beach makes live before you in the clean-cut pages of **THE BARRIER** are intensely human. More than one of them will become celebrities in fiction.

THE STORY? In the opening chapter of **THE BARRIER** the reader scents a mystery and is on the eve of a love affair. Old man Gale, a trader at Flambeau on the Yukon, the father of three children mothered by an Indian squaw, brings the story on with a rush. His daughter, Necia, a beautiful girl of eighteen, is **THE BARRIER'S** heroine. Necia falls in love with and is loved by Lieutenant Burrell, a young Kentuckian, arrived with a handful of men at the post to act as mounted police. From this critical moment there is not a dull page to the end. Some quaintly humorous characters are introduced also. In fact, the humor of **THE BARRIER** is another feature in which it surpasses "The Spoilers."

HARPER'S WEEKLY for NEXT WEEK

SKIRMISHING FOR THE PRESIDENCY

This is the second part of the remarkable article by Frederick Boyd Stevenson setting forth the claims of the men who will play the leading parts in the drama to be enacted this summer within the walls of the convention halls at Chicago and Denver. The first part of Mr. Stevenson's article is published in the present number of HARPER'S WEEKLY.

No voter should miss this graphic and impartial presentation of facts and personalities which are now of such moment.

THE SERVANT IN THE HOUSE

By

Charles Rann Kennedy

We do not publish plays—but here is a drama so great, so compelling, so reverent, so akin to all the beautiful and permanent things in life, that it is more than a play, more than a novel, more than a mere book. It is a page from life itself, revealing the brotherhood of man as a real, breathing thing, showing how the impossible has become possible. According to the critics, "Not in a lifetime has such a wonderful play been created"—and it reads as well as it acts.

I have tried to set forth the only feasible law in society that of a spiritual brotherhood among mankind which is both Christianity and Socialism.
Charles Rann Kennedy.

COMMENT

A Reminder from the President

BECAUSE the President's message of April 27 reached the Senate just about dinner time, and at the close of a hard-working eight-hour day, the Senate determined not to hear it on empty stomachs, and adjourned. There was nothing in the message that would not keep overnight. The President expressed himself as pleased, though not fully satisfied, with the employers' liability bill, and hopeful of further legislation to recompense all employees who are injured in the public service. He also hoped for a child-labor law for the District of Columbia; for the continuance of the Watersways Commission, with money enough to make it useful; for provision for an investigation of the tariff by a committee of the House, aided by government experts; for financial legislation of a precautionary and temporary nature (meaning an Adams bill); and for a commission of experts to investigate the whole currency problem, and recommend legislation that shall be permanent.

Current Presidential Desires

Some other measures that he wants he seemed less sanguine of getting, and so devoted more space to them. He urged an ample appropriation to enable the Interstate Commerce Commission to examine (under the Hepburn law) the books of the railways; pointing out, curiously, that failure to do it "would benefit, as nothing else would, those railways which are corruptly or incompetently managed." But such roads just now need surely all the benefit they can get, and Congress may think so. Asking again for forest reserves in the Appalachian Mountain region—a concern of the utmost importance—he went on to expound at some length measures near his heart: (1) to correct the abuse of the power of injunction, and (2) to render more efficient and wise the control by the government of the corporations doing an interstate business. The fault he finds with the existing power of injunction is that in some cases it has been used to the injury of the rights of laboring-men. He asks to have it so limited as to avoid an unbridled effort to destroy it altogether. He asks for more effective Federal control of the corporations. Repeating "the well-meaning persons who now desire to abolish the anti-trust law outright, or to amend it by simply condemning 'unreasonable' combinations," he says:

Power should unquestionably be lodged somewhere in the executive branch of the government to permit combinations which will further the public interest; but it must always be remembered that as regards the great and wealthy combinations through which most of the interstate business of to-day is done, the burden of proof should be on them to show that they have a right to exist. No judicial tribunal has the knowledge or the experience to determine in the first place whether a given combination is advisable or necessary in the interest of the public. Somebody, whether a

commission or a bureau under the Department of Commerce and Labor, should be given this power. My personal belief is that ultimately we shall have to adopt a national interpretation law, though I am well aware that this may be impossible at present.

Those views will hardly affect the action of Congress in the present session, and perhaps the President does not expect them to, since the manner in which they are put forth suggests a message to the people rather than to a lawmaking body. There will be no general agreement yet with his opinion that "the decisions of the Supreme Court in the Minnesota and North Carolina cases illustrate how impossible is a dual control of national commerce." He would temper somewhat the Federal corporation law to the labor organizations, because they are not formed for profit. (But they are, aren't they?) But he would by no means exempt them from the restraints of such a law, and would sanction neither boycott nor blacklists which would be illegal under the common law.

A Little Jolt at the End

The message is of moderate length and gentle temper. It winds up with a characteristic burst of exhortation to us all not to be greedy; to abide by the plain and simple rules of honesty, not to carp at wealth honestly acquired, nor be jealous of the thrifty. If we do yield, he says, to those naughty impulses, our counterpart in evil will be found in "that particular kind of multimillionaire who is almost the least enviable, and is certainly one of the least admirable, of all our citizens: a man of whom it has been well said that his face has grown hard and cruel while his body has grown soft; whose son is a fool and his daughter a foreign princess; whose sensual pleasures are at the best those of a tasteless and extravagant luxury, and whose real delight, whose real life work, is the accumulation and use of power in its most sordid and least elevating form." Folks of the above lamentable type are as sure, says the President, to turn up nowadays in the chaos of unrestricted commercial individualism as marauder-barnes were in the dark ages. He explains that he is after legislation "to minimize the abuses which give this type its flourishing prominence." Minimize the abuses by all means, but do it because they are abuses, and not because the folks who get rich by them are not pretty. Our foolish rich are our most instructive class. The ridiculous miseries of their condition, advertised as they are in every corner of the land, are of the utmost value in making modest folks content. There is no need of hugging down any structure of value to roast a few pigs, especially when they are so useful while still uncooked.

Quite Satisfied

HARPER'S WEEKLY is trying to get Mr. BRYAN to be more positive in his refusal to serve again.—*Birmingham (Alabama) Ledger*.

Not so. It is entirely satisfied with his refusal, and does not think they need an added word.

Can Bryan Think Right?

A correspondent who signs himself "Student" writes to us from Cambridge, Massachusetts, as follows:

You say in an editorial (March 28) on "The Trouble with Bryan":—"But for one thing all Democrats who are opposed to him would be for him; that one thing is profound distrust of his ability to think right."

May I ask who has this profound distrust, and what are instances of his inability to think right? You do well, it seems to me, to avoid urging unavailability as an objection to BRYAN's candidacy, but that he is incapable of right thinking seems to me even more untenable.

Mr. BRYAN's ability as a statesman is indisputable in view of the fact that he is the actual leader of the prevailing political sentiment of the country irrespective of party. To assert in the face of this fact that he lacks the ability to think right is, from the Democratic point of view, patently absurd, and simply amounts to saying that his thinking is not in harmony with that of a comparatively small minority.

Here is part of an editorial from the New York World of April 21, which, it may be, our correspondent can read with profit:

When Mr. BRYAN returned in August, 1906, from his tour of the world, the Democratic party was at its feet. Convention after convention had endorsed him. Democrats from every part of the

country came to New York to greet him as their candidate for President. No other name was mentioned in connection with the nomination.

Drunk, with power and applause, Mr. BRYAN rejected the counsel of the party leaders and advocated government ownership of railroads in his Madison Square Garden speech. Instantly the fat was in the fire. The South repudiated his policy at once, and he was finally forced to abandon it on the pretense that nobody wanted to make it as loose in the 1896 campaign. Mr. BRYAN is now in the ridiculous position of a candidate who is clamoring for more government regulation of railroads, and is on record as declaring that government regulation is found to fail.

No sooner had Mr. BRYAN dropped government ownership than he tried to commit the Democracy to the initiative and referendum. In his Brooklyn speech April 16, 1897, he threatened substantially to drive everybody out of the party who did not believe in his new policies. Eastern resentment soon coagulated him to subordinate the initiative and referendum, as Southern opposition had forced him to drop government ownership.

He proceeded next to make the Democratic party an annex to the Roosevelt administration, endorsing "my policies," and absolving Mr. ROOSEVELT from all responsibility for the panic. At present, if he has an issue at all, it lies in a veiled reversal of the 1896 threat to pack the United States Supreme Court.

The main trouble with Mr. BRYAN is that he has no fixed political principles: no economic stability; no grasp of the real problems of government. He is essentially an agitator with strong dramatic predilections, given to emotional rather than to reasoning.

With the narrow opinion characteristic of men of his type, he is unable to account for the opposition to his nomination except on the theory that "prejudice" exists against his spending money to defeat his candidacy. He is incapable of understanding that intelligent, thoughtful Democrats everywhere are against him because he has proved himself wholly unworthy as a leader; because his denunciation of the party is disastrous; and because he is temperamentally disqualified for the office of President.

Not Born to be a Statesman

Here are given two striking examples of Mr. BRYAN's attempts at political thought. They are the most ambitious attempts he has made since his present candidacy became active. In neither of them did he show himself the leader of any considerable body in either party. He put government ownership on his book, dropped it in, and never got a bite. On the contrary, the expected failure began to disperse with such evidences of disgust that the augur pulled up and changed the bait at once. But the initiative and referendum did no better. Reluctantly he dropped that, and helped himself to what he needed out of Mr. ROOSEVELT's bait can. Remember that these two exploits of nomination came at a time when thousands of Democrats whom BRYAN had secured off by his free-soil delusion were looking to him with hopeful expectation, ready to make him their candidate if only he showed that time and travel and study had brought him wisdom. Nothing will teach him political wisdom. His head is not built to hold it. His processes of thought do not yield it. He cannot think right on the great concerns of political policy and statecraft. Doubtless he would if he could, but the power has not been given him. What has been given him is a remarkably strong, enduring body, a magnificent assurance, an engaging manner, and a wonderful gift of speech. He is full of talent; he makes many friends; he is one of the best talkers in the world. These gifts have won him the leadership that he enjoys. He is a great fellow, is Dr. BRYAN, but he is not a great statesman and never will be. He is a fair moralist, a great entertainer, and would probably have made a notable preacher or an extraordinary actor. That he has great gifts is indisputable; that he has great personal attractiveness is evident. So also is it evident to any thoughtful student of his record that he is unfit to be trusted with the great responsibilities of the Presidency.

Name Henry Began It

MR. WATKINSON hits the weak spot in the Governor JOHNSON's movement against BRYAN. It began with and is being promoted by the wrong people, which is to say the reactionaries in the Democratic party.—*Springfield Republican*.

It began with MR. WATKINSON. He opened it with a guessing contest.

Mr. Bryan As He Is Seen

MR. BRYAN made a stump speech the other day in Detroit, the first political speech he has made there in several years. The *Free Press* went to hear him, and observed him, and listened to him thoughtfully. It found him much changed. It says:

Many changes are revealed to those who contrast his present platform effects with those utilized by him in former campaigns, particularly in the storied 1896 campaign. Some of these changes are disillusioning.

Who can forget that admirably proportioned young man of striking, indeed handsome, face who waylaid vast audiences under the appeal of inspired purpose in that tremendous campaign of twelve years ago? Scarcely indeed were his listeners moved to laughter, or even to a wince. He was fiercely in earnest, masterful, intense. Laughter would have been an anathema.

We did not credit Mr. BRYAN then with any very keen sense of humor. We cannot credit him with any such quality now. He takes himself as seriously now as then, and still, perhaps as a result of his experience in calculating people from the lecture platform, he has come to rely in almost inordinate measure on humorous effects. His speech at the armory in this city Thursday night was even punctuated—guaranteed, we believe, an approved word in this connection—much more by laughter than by applause.

An audience under the spell of the intense BRYAN laughs a great deal more than it cheers or applauds! This in itself is disillusioning.

And what is the apparatus by which he produces his humorous effects?

Stories about funny colored men and the old, old device of applying Scriptural phrases and references to our own modern conditions—these constitute his chief repertory in laughter-producing devices. Though sarcasm, an old weapon in his arsenal, and a modification of his old trick in phrase-making are occasionally employed.

The stories about colored men are by no means new, and the form of the Biblical applications isn't always a credit to the humorist's sense, but the audience invariably roars. Are there some of them who laugh not so much at what is said as at the fat, bald man who says them? There is something in his pose as he waits for the merriest to subside that recalls the late W. J. FLANNERY.

When have we ever had a more or prospective smile for President who dared to inspire such tumultuous laughter as Mr. BRYAN evoked Thursday night? Mr. ROOSEVELT never did. Mr. McKINLEY never did. Mr. CLEVELAND, of course, never did. Mr. HARRISON never did. Isn't Mr. BRYAN taking a risk in thus court-circuit classification as a humorous character?

LONG AGO JAMES A. GARFIELD was advised by THOMAS COWEN of the danger a man who aimed at the very highest honors in American politics took in trying to be amusing to his listeners. GARFIELD, who found it difficult to resist the temptation to be funny in his earlier years, reformed.

Mr. BRYAN's present style in stump speaking is admittedly entertaining and has great variety in appeal, but supposing it should result in his being referred to not as the Peerless One any longer, but merely as a fat, bald man who is growing old and who makes you laugh!

We have quoted thus at length because the *Free Press* seemed so illuminating. Not but that Mr. BRYAN puts plenty of politics into his political speeches. He does—of a kind. But what the *Free Press* says of him matches what we hear of him and his speeches elsewhere. He draws great crowds, and gives great satisfaction, but his success is a success not in persuasion or conviction or political stimulation, but in entertainment. Folks of all parties hear him gladly and are delighted. But with what? They that live by the sword, it has been said, shall perish by the sword. What of them who live by the lecture platform? Are there two prices paid in that business, one by those who go in to hear, the other by those who speak?

Waning Charms

A Denver despatch says that WILLIAM D. HAYWOOD, for many years secretary-treasurer of the Western Confederation of Miners, has been put off the Executive Board of that organization. So! Possibly as the glamour of acquittal wears off HAYWOOD's late admirers begin to doubt the expediency of holding him up as an example of virtues they desire to emulate. Many a man has gone unburned to unexpectedly valuable uses.

A British Naval Expert's Opinion of Our Navy

Sir WILLIAM HENRY WHITE, K.C.B., F.R.S., late chief constructor of the British navy, said the other day to a representative of the *Boston Evening Transcript*:

In my opinion, you have a fleet that, ship for ship, comparing the ships designed at a given date—and that is the only fair comparison—is equal to anything the world contains, and next to the British navy I think your navy is the best in the world.

Amen! Mr. RUTHERFORD's home is now dead. For some time it has been bogging distressfully at the edge of the valley into which bogies tumble, and Sir WILLIAM should have every-

boly's thanks for having given it the push *de grace*. Now it is to be hoped that Mr. HAYWARD will let it lie, and not write any more letters to the newspapers.

Judge Willey Finally Exonerated

The House Judiciary Committee has refused to take for its own the opinion of its sub-committee that although Judge LEONARD R. WILLEY, of the United States Court for China at Shanghai, cannot, for lack of evidence of his having exceeded his authority, be impeached, he nevertheless merits censure for an unduly harsh exercise of the same. To the second part of this opinion it is that the full committee very properly takes exception, it being manifestly without foundation in that the sub-committee (by its own confusion) never considered the merits of the case, or even so much as gave the accused a hearing. It may be that Judge WILLEY was somewhat arbitrary—but to be somewhat arbitrary is a fault habitual with most good reformers; and to have recommended anything but unqualified exoneration would have been most ungracious and unjust.

For Home Rule in New York State

The Home Rule Democracy of the State of New York organized for business at 11 o'clock on April 25. It is the result of a conference held in that city by persons who were displeased with the arbitrary proceedings of the masters of the late Democratic convention in New York. Its purpose is to extricate the State organization in New York from the control of CHARLES F. MURPHY, of Manhattan, and WILLIAM J. COSSONS, of Buffalo; also to rescind the resolution adopted at the late convention empowering State conventions to name State committeemen, also to send reorganizing committees into every county in the State. All these intentions seem commendable. MURPHY and COSSONS are able men in their line, but hardly able enough to give a satisfactory answer at present to the average New York voter who has occasion to ask himself, Why am I a Democrat?

Concerning a Fatherless Service

Our poor army! It has become very lean of late; so lean, in fact, that butter, milk, spices, flavoring extracts, lard, and \$7,000,000 in annual pay have been added to its diet. Perhaps these extras will tend to diminish the number of deserters and increase the number of recruits, and the army be restored to its full peace strength of seventy-odd thousand men. But even then we shall not have as many soldiers as we need. The Commander-in-Chief, and the Presidential candidate, and the chief of staff, and the man in the street realize this. But not Senator HALE. The other day he characterized the proposal to double the size of the army as "unreasonable and wicked." To call it untimely is enough. The increase will have to come, but not this year.

Not a Hateful Man

HARPER'S WEEKLY makes it its point against REYAN that no one hates him. That is because they know he must get there.—*Minneapolis Journal*.

It is not a point against Mr. REYAN that no one hates him. He is amiable, he is very popular, and there is no reason that we know of why he should be hated, though there are plenty of reasons why he should not be President. No one hates Dr. WILSON or Governor JIMISSON, but that is not a point against them.

Not All Done by Mr. Astor

To be sure WILLIAM WILSON ASTOR is a recreation which no indolent American need begrudge his countrymen. Nevertheless, the chorus of yells that has greeted the disclosure of his action about the *Chesapeake's* flag seems to us to be somewhat lacking in intelligence. Would there have been any kind of solace or satisfaction in resigning by purchase a flag fairly and gallantly lost in war? To our mind, quite the contrary. The *Chesapeake's* flag belongs permanently in England, as certainly as the *America's* cup belongs for the present in New York. It was a scandal that the flag should have been offered for sale at auction. That was like leaving dynamite to be kicked about the street. Mr. ASTOR bought the old trophy and put it in a suitable semi-public depository, where it will always get respectful treatment. What he did could not be bettered. The only fault that can be found with his action is that it was his.

New York's Catholic Centenary

ONE of the most interesting and impressive celebrations that have been witnessed in New York city took place in the week beginning Sunday, April 26. The purpose of the remarkable gathering of American Roman Catholic archbishops and bishops, headed by Cardinal GIMONNE, a gathering which included also several Canadian prelates, and Cardinal LAGRANGE, the Roman Catholic Primate of All Ireland, together with Mgr. FALCIGNI, the Apostolic delegate of Pope PIUS X., was to commemorate the foundation of the diocese of New York in April, 1808. The growth of Catholicism in the State and city during the last hundred years may fairly be described as amazing, when we take into account the disabilities under which the Roman Catholic pioneers labored in Protestant communities which not long before had enacted and enforced penal legislation against them. The phenomenon seems the more astonishing when we keep in view that during the same period the Papal religion has lost much ground in the Old World.

There is reason to believe that in 1808 Protestant colonists regarded with good-natured indifference the erection of the Roman Catholic diocese of New York. In the whole territory covered by the new see, which originally comprised not only the State of New York, but the eastern part of New Jersey, there were then only a few thousand Catholics and three or four priests. The Presbyterian, the Dutch Reformed, the Episcopalian, the Congregational, the Methodist, and the Baptist churches were all apparently much more firmly rooted in American soil, for even in Maryland, Catholics, although they had first settled the colony, had been subjected to laws discriminating them. Not until the fourth decade of the nineteenth century did that anti-Catholic sentiment become widespread which was to lead in the sixth decade to the formation of the Know-nothing party.

It is a mistake to assume that the expansion of Catholicism in the diocese of New York was due wholly to the enormous influx from Ireland which followed the famine year (1847), and to the almost simultaneous arrival of tens of thousands of emigrants from the southern or Catholic section of Germany. The truth is that before those great streams of alien population reached our shores the Roman Catholic Church was securely planted in the New York diocese, and had already attained proportions which many Protestant observers viewed with surprise, and by-and-by with alarm. As early as 1811 the City of New York alone contained from four to five thousand Catholics, a number which, ten years later, had risen to 25,000, while the whole diocese at the last-named date was credited with six times as many. In 1840, two or three years before the immense influx from Ireland and Germany began, the city of New York had over a hundred thousand Catholics, and in the whole diocese there were more than a hundred churches and priests. With the extension of population the diocese had to be divided, and the two new sees of Albany and Buffalo were carved out of the original one, the diocese of New York retaining only the counties of that State which lay south of the forty-second degree, and the eastern part of New Jersey. In 1853, two years after New York had been made an archdiocese, a further curtailment of territory occurred, the dioceses of Brooklyn and Newark being cut off from the parent see, leaving to the latter only the city of New York and eight other counties in New York State.

Even thus reduced the archdiocese was then computed to comprise 250,000 Catholics, more than half of whom were dwellers in the city of New York. In the island of Manhattan it was estimated in 1895 there were three-quarters of a million of Catholics, and it is not impossible that almost double that number may now be found in the archdiocese of New York, compiled with the diocese of Brooklyn. It has been calculated that at the present time (1905) there are not far from fifteen million Roman Catholics in the whole of the United States, although some well-informed persons regard the figures as exaggerated. Professor THOMAS D'ALTON, of the Catholic University of America at Washington, expresses the opinion that such computations are left of little worth if the returns of baptism from the various parishes are not correct, and if the figures used as a multiplier is not uniform in all the countries. He is inclined, therefore, to look upon the statistics given in Catholic directories as largely based on guesswork. His own estimate is that in 1895 there were about twelve millions of Roman Catholics in the United States.

The part which Catholics of the archdiocese of New York played in the Civil War is well known. No other section of the people of the Free States showed itself readier to make greater sacrifices for the preservation of the Union. There was, perhaps, no single citizen of New York who did so much to recruit the Union armies as personal exhortation and organizing power as was done by Archbishop ANTHONY HENRICH. Nor is there any doubt that in the sad official announcement to him by President LINCOLN he exerted an influence in Paris and elsewhere in Europe which had much to do with preventing foreign intervention on behalf of the seceding States.

It is not only in the number of her churches and communicants that the diocese of New York presents a notable example of growth.

The work done by her in education has expanded proportionally. In 1868 there was only one parochial school in the province, which, we repeat, then included the eastern part of New Jersey as well as the whole of the State of New York. To-day there are over 130 parochial schools in the archdiocese alone. For a long time after its erection the see of New York was in more sordid straits. More than once during the first half-century of its history it had to appeal to European countries, and even to Mexico, for assistance in order to provide the simplest accommodations for its fast multiplying people. To-day the New York Archdiocese, after supporting nearly a thousand Catholic churches and hundreds of schools and seminaries, sends on an average \$70,000 a year to aid missions in Mexico and other parts of the world.

In a timely article Archbishop FARLEY directs attention to the value of the work done by the Catholic Church in assimilating the diverse elements of New York City's population. There seems to be no doubt that there are in New York more Catholics than in any other city on earth, and excepting Paris, where almost all the workmen, unskilled or skilled, and a large part of the shop-keeping class in the French capital, regulate their lives by the Catholic Church, the Catholic population, however, is heterogeneous in an unparalleled degree. If we accept the moderate estimate that there are now 1,500,000 Catholics in the archdiocese, we find that only 515,000 are American born, and even these are largely the children of parents one or both of whom were born in foreign parts. Among the foreign-born Catholics, the first in numerical importance are the Italians (300,000); next come the Irish (140,000); then the Germans (40,000); then the French (25,000); there are also 20,000 Spanish-speaking people, 15,000 Bohemians, and more or less considerable groups of Albanians, Poles, Ruthenians, Hungarians, Slovaks, Lithuanians, and Belgians, besides English and Canadians. It is a fact often overlooked that there are thousands of negro Catholic emigrants; the borough of Manhattan has a Catholic Church for colored people, that, namely, of St. Benedict the Moor. Archbishop FARLEY points out how seriously the Catholic Church has taken up the burden of caring for the immigrants that have flooded by millions to the chief port of the New World. More she has taken into her fold, and has devoted herself to adapting them and welding them into the body politic. In the same article the archbishop dwells on the benefit to the community resulting from the attitude of the Catholic Church toward divorce and intemperance. Few candid men will deny that he succeeds in making good his declaration that no citizen loses this country with deeper affection than does a Catholic, and nowhere can be found a more patriotic American. So that the growth of the Catholic Church in New York City during the last hundred years must be as well known to have been a good to the whole metropolitan community.

Reverie and Action

WHAT greater joy to the reader than to find, lying upon the table at one time, two sincere confessions of the inner life from sources as widely diverse as possible; under the shifts and turns of circumstance to trace out the underlying resemblances; the same luminosity raying with the same difficulties, climbing painfully the same stairway of knowledge and reality?

So it happened, by a lucky chance, that a fairly recent life of Sir RICHARD BURTON, the great English explorer, lay side by side with AMEL's *Journal* which made such a sensation a quarter of a century ago.

BURTON had many of the endowments of a primitive man. If he thought, he was yet in no wise "skilled over with the pale out of thought." Firmly rooted in his mother earth, robust, buoyant, fearless, of iron nerve, intrepid will, brisk and brusque, one might fancy at a glance that he had nothing in common with the wounded AMEL, hurt and hidden, crumpled down by the weight of melancholy thought, overwhelmed and helpless in the face of a life that demands so uncompromisingly a union of earth and spirit, body and mind.

BURTON's was distinctly the rough and ready method of life. Difficulties stimulated him, and his ways of dealing with them were exuberant. Expelled from Oxford during his student days, he left in high feather, driving a coach, and explained his unexpected arrival in his father's home by announcing that he was given an extra holiday on account of having won a double first, and the explanation collapsed only at a large dinner which his father gave to celebrate the event. Exactly how he met this reversal of fortune biography fails to say, but at least one can count upon its being met with buoyancy and fertility of further design. For throughout BURTON escaped AMEL's sin of despair. The great explorer's world was in motion, and at any rate, and there were no less undertakings to be carried out, contacts to win, robes to weave. Formulas and logical superfluities counted for little to him in this big world, so fat for intellectual curiosity to feed upon, so irresistible for the trained eye and ear, so full of strange bits and gleamings in various tracts.

It is one of the ironical paradoxes of life that achievement, after

all, rests so little upon a physical basis. BURTON's exploits rival those of COLUMBUS, DRAKE, and BALBON. And yet, doubtless, the one great finished achievement of the student AMEL, shall rank as much as all BURTON's volumes, "which," says his biographer, "stacked would make a pile eight feet high." He penetrated every unknown and hidden corner of the earth that struck his fancy; he became, at different times, a hundred different men; disguise lured him, and one life and one personality were all too meagre for his restless mind. As a Sufi, he was the first European to enter Mecca; in 1854 he explored the forbidden and unknown city of Harar; two years later East Africa drew him. "One of the gladder moments in human life is the departing upon a distant journey to unknown lands," he wrote, and undoubtedly he had more such moments than fall to the lot of other men. He went to Salt Lake City and through the Western States, and followed this up by exploring West Africa and the Nile basin; in 1852 he was in Iceland, in the mean time having paid a visit to Dahomey, admired the Amazons, held consulships in Africa and Brazil, and made alone a canoe trip of 1500 miles down the river Sao Francisco. The only very desirable post he held was the consulship of Damascus, which he lost in short order by his fearlessness in sinking enemies and his ruthlessness in wounding enemies.

And yet this is the man who wrote:

"Eternal morrows make our day; our *fa* is eye to be, till then
Night closes in: 'tis all a dream, and yet we die—and then?
And then?"

Early in life it would seem he had drunken of SOCRATES' wisdom and known that all is vanity under the sun. Though the burden of life was heavy, hope deceptive, designs brittle, he seems never to have been of the weaker, the splendor, the luxuriance of creation. He writes:

"We dance along Death's icy brink—but is the dancer less full of fun?"

His exuberance of vitality, his bond to earth, never failed him, and when, late in life, his Arabian *Yapha* began to bring him in money, giving him almost, for the first time in his life, a feeling of affluence, he is chronicle as spending it like a dissipated school-boy and revelling in his ease.

Against this brazen and bracing character it is interesting to set the speculative dreamer AMEL. In the one case we have omniscient personality turning itself loose upon knowledge, experience, sensation; in the other, fastidious personality, choosing, rejecting, finally all that is bounded and earthy and dissolving into the infinite, the boundless.

And yet, like BURTON, with his endless disguises, his innumerable religions, his manifold personalities, we find AMEL, too, saying: "This nature is, as it were, only one of the men which exist in me. My horizon is vaster; I have seen much more of men, things, countries, peoples, books; I have had a greater mass of experience." We find them both offering the same causes of grief, man's age-long sorrow over mortality, over the instant passing of beauty, over the fragmentary nature of mind and perception, the insoluble mystery of being.

"Life passes," says BURTON, "like scenes that round a drunken reel." And AMEL: "Wisdom consists in lending oneself to the universal illusion without becoming its dupe. It is best, on the whole, for a man of taste, who knows less, to be gay with the gay and serious with the serious, to enter into the game of *Mala* and play his part with a good grace in the fantastic tragedy-comedy which is called the universe. . . . The mind in its intellectual complexity arrives at the intuition that all reality is but the dream of a dream."

Both these men, early in life, faltered the worthlessness of mere sensual joys. Of those who solve the problem of living by eating, drinking, and sporting BURTON says:

"Two-footed beasts that know through life, by death to serve as food designed."

How prone to earth whered they lie and there the proper pleasures find."

And again:

"I've tried them all, I find them all as same and tame, so drear and dry;

My gorge reviveth at the thought; I commune with myself and cry:—

Better the myriad boils and pains that make the man to manifest true."

This is the rule that guideth life; these be the laws for me and you—

With ignorance wage eternal war, to know thyself forever true
Thine ignorance of thine ignorance is thy fiercest foe, thy devil
—lost hand."

Both men took refuge from vanity and hollowness in a religion half stoicism, half humanitarianism.

"Not to thy heart," the sage said, "nor means the past, the buried just."

Do what thou dost, be strong, be heavy; and like the star not rest, nor loiter!"

writes BURTON, and AMEL, near the close of his journal indulges at the close of certain heartrending reflections, "I wish to die

without rebellion and without weakness; that is all." But AMMIL went far ahead of BYRON when he discovered that the redemption of the intellect is in no wise equivalent to the redemption of the heart.

But what is best worth noting in these two lives is the extraordinary painfulness of both of them, till we come in to see how great a factor grief may be in this initiation into consciousness which we call life. Could any happy or fortunate life leave so precious a legacy to humanity as was left by these two gigantic sufferers? To neither of them could life or religion be reduced to a formula. Both lived alert and aware of the content of the moment as it slipped by them; the senses were to them the best means of approach to fuller being, deeper awareness. Perhaps, after all, this is not far from being the truest religion, since it raises life through pain to dignity, and while such religion sends its roots deep into mysticism its fruits are noble deeds and high conduct.

Personal and Pertinent

THE DEATH OF BARNEY, the hairer, is announced at this writing, but without guarantee that he will remain dead. A perfectly unfeeling person, dead or alive.

THIS Journal has begun to receive communications addressed, "Woman's Suffrage Headquarters, care of HARPER'S WEEKLY," an address possibly due to the interesting article entitled "Votes for Women," in the WEEKLY of April 25. Inasmuch as it is to admit it, the WEEKLY has not yet believed the distinction imagined by its too flattering correspondents. The true centre and focus of the suffragist movement is the Martha Washington Hotel, New York.

Count TULSKY recently gave his ideas on education, and they are not without interest. To a certain extent his method would follow the ancient Greek curriculum. Languages would correspond to the Greek's rhetoric, modelling, and sculpture, and music and singing would correspond to the Greek's "music"; in addition, he urges that some trade be learned. The subjects of religion and morality, he believes, can be taught to children only by precept at home, but all the others are for the schools. But at this point Count TULSKY advances a singular plan. The instructors must, indeed, fit and regulate the hours, "but the pupils should be at liberty to come to school or not to come." The Count's theory is that the pupil must be left absolutely free to study or not to study, just as man is free to eat or not to eat.

HARRY DITCHMAN, upon whom Judge Woon of Boise, Idaho, pronounced the death sentence on March 18, with a recommendation for pardon, is still in the penitentiary at Boise. This institution is situated just outside the city limits, and has a record of probably the lowest death rate of any place of the kind in the world. For instance, there was only one death during the two years that ended November 31, 1906. The daily number of prisoners averages two hundred and twenty. The parole system is in force, and is regarded as practically a success in the penitentiary.

OSWALD has visitors from time to time, but it is difficult to see him. A prominent young actress, who was playing a "one-night stand" in Boise, sent her card to him, and was informed that he was "busy with his stenographer." He was at that time engaged in writing his life, which has since been published, with a preface by a local clergyman of good standing. The wife of the warden of the penitentiary told one of OSWALD's callers that they were all much attached to the murderer, as he was "the loveliest gentleman." To which the caller replied in good faith that he had observed that none of Mr. OSWALD's stamp always had "good dispositions," which is either humorous or psychological, just as the reader fancies.

Correspondence

CERTAIN SOCIAL CONDITIONS IN THE FAR WEST

From March, 1907

To the Editor of Harper's Weekly:

SIR,—When ladies with correct religious inclinations are informed by people whose accuracy and truthfulness they rely upon that numbers of their fellow-creatures cannot gain an entrance into heaven unless they marry, it is logical that they will not only marry, but, in the agitation of spirits caused by this terrible alternative of non-marriage, will marry almost any man who offers himself and at once—even assuming that he already possesses a wife or two, after the example of exemplary Biblical characters whom he persuasively quotes. This is of course presuming the bigoted ladies to have been reared in the Mormon faith, which is a faith with some good points outside of its polygamous tenets, or to have been brought up in clerical religious ignorance. This particular habit of the Mormons, of raising the whole of heaven into the balance scales in their own favor when

they propose marriage, is an unfair advantage over every non-Mormon man. The average person may offer a small portion of heaven to the woman whom he would induce to accept him as a husband, but only the Mormon can promise her the whole realm of paradise, and even interestingly threaten her with the loss of it if she rejects him. This Mormon suitor, being already in some instances the husband of one or two other wives, is by the addition of a third wife a still more effective agent for the extension of the Mormon faith, and is reasonably safe even from anti-Semite Senatorial inquiries, since his marriage is not legally recorded, and can with difficulty be discovered or proven, being merely the "sealing" to him of a woman by verbal agreement, or by those mystic ceremonies in the "Temple" at Salt Lake City to which no "gentile" is ever admitted. For that these "plural" marriages will continue, despite the prohibition of them by law, there is no sort of doubt, not only in the State of Utah, but in other Western States where thrifty and otherwise law-abiding Mormons have congregated in more or less numbers. Nor is it difficult to perceive the probable result in these Western States where the suffrage has been granted to women, certain numbers of whom may be Mormons, or subjected to Mormon influences. The woman who believes a polygamous husband whom he tells her that without him there is no heaven for her son, will hardly be inclined to disregard his instructions in casting her vote. These are the peculiar and even threatening social conditions in some portions of the far West, and the thoughtful reader will appreciate what a pretty, if not exactly American, game of politics may be played under these rules.

I am, sir,

TRAVELLER.

RU'N AND NEGRO'EN IN JAMAICA

April 26, 1907

To the Editor of Harper's Weekly:

SIR,—In your issue of April 25 you make mention of the abundance of rum sold in Jamaica to negroes, good rum at that, and yet the negroes are "peaceful, orderly, and no drinkers."

In Bermuda, where a prevalence of five months enabled me to see the entire island and to carefully observe the habits of the natives in some respects, and where there are 12,000 negroes to 10,000 whites; where liquor of various kinds is sold in astonishingly large quantities to men of all color, I did not once see a drunken negro—one sufficiently under the influence of alcohol to make him abusive, noisy, and disagreeable. But I did see one intoxicated white man, a British army officer, who was no tipsey at a ball at one of the hotels that he could not negotiate the polished floor.

Whoever will take the trouble to walk from St. George to the commissioner's house on Piracy Bay, and who will look under the shrubbery by the wayside, will find abundant evidence of the bibulous habits of the natives—for he will see bottles galore—wine bottles, black bottles, short bottles, slim bottles, fat bottles, blue bottles, green bottles; in short, bottles of every conceivable size, shape, capacity, and color. These empty vessels speak in eloquent terms of the habits of the natives—and yet there is no drunkenness in Bermuda. Why?

The answer to this question, if applied to the liquor problem in New York City, would do more to reduce and make respectable the habit of drinking than all the laws and ordinances the State of New York and City of New York combined ever laid upon their statute books.

I am, sir,

"NEUROLOGIST."

We hope our correspondent will tell the answer, if he knows it.—EDITOR.

WE DO GIVE MR. TAFT FULL CREDIT

From Texas, April 2, 1907

To the Editor of Harper's Weekly:

SIR,—I am heartily in accord with Mrs. F. B. W., of Unskill, New York, whose letter appears in your issue of April 4. Also, I would think that any enlightened patriot could pay party politics aside and give Mr. Taft credit for services he has so creditably rendered our country.

I am, sir,

A. B. Q.

BYRON AND THE RACE ISSUE

From West, March 5, 1907

To the Editor of Harper's Weekly:

SIR,—We have had Byron with his visions and vagaries. We shouted ourselves hoarse as beneath a "terrified Democracy" we bowed in humble obedience. We are ready to imitate Democracy's best interest at Denver. Why?

Is there any satisfactory reason why Byron has not expressed himself on the question of questions—the race issue? Is not the South due some sympathy, at least, from one who has been so loyally supported? Shall Democrats respect his cause because he claims to be honest? Is all honesty centred in him?

Does it make him a statesman that one out of his ten thousand prophesies some "true"?

We need a man of commanding dignity and pre-dig. May the gods help us in this extremity?

I am, sir,

J. L. JONES.

Finance

The Significance of the Improvement in the Bond Market

By HOWARD SCHENCK MOTT

Americans "go the pace." There is nothing temperate about us. We are used to big things and frequently we accomplish much in a day, a week or a month; but if quick accomplishment be denied, we are plunged temporarily into the depths of gloom. We must make money rapidly, or we think we are not making money at all. We must do a maximum business, or shut down our factories and workshops.

We are not conservative in times of prosperity, nor are we sedulously cheerful in times of adversity—until a few point the way. We go to extremes. It is a characteristic not entirely creditable, but it is a characteristic.

No our property values fluctuate with the same violence as the general estimate of them. I do not mean to say that the question of property values is wholly psychological. Far from it. Indeed, I expect to show, before you shut down this page, that natural forces are controlling. Nevertheless it is a fact, determined by competent observation, that the state of the public mind is a factor which aggravates the effects produced by the operation of natural forces.

The genesis of these reactions lies in the sudden improvement that appeared in the bond market last month. After nearly three years of deflating prices, in January of the present year the prices of bonds began to recover. In February they experienced another setback, because the earnings of corporations fell off in an alarming manner and capital remained extraordinarily timid and doubtful about even underlying values in corporate properties. In March there was a moderate revival under the influence of buying by a few of the more daring investors who retained their courage and believed in the development and growth of the country and of corporate property, in spite of all obstacles.

But the really important event in the financial markets last month was the placing of the Pennsylvania Railroad Company's loan of \$40,000,000. This issue of bonds was subscribed for many times over. The first to point the way in this case were great international bankers, and the issue was conceded to be, at the time of its announcement, a test of the investment markets' absorbing power. That the offering met with such extraordinary success showed that investors were waiting more eagerly than was generally believed for news for their funds that could be considered safe. Beginning just before and continuing since the Pennsylvania announcement a veritable flood of new bonds and notes came on the market, and the rapid manner in which they were absorbed astonished even the most experienced observers of financial affairs. The old axiom that continuously idle capital is an economic plague again was amply demonstrated. From the first of January to date, between \$250,000,000 and \$250,000,000 of new bonds, notes, and stocks has been authorized, and nearly the whole amount has been issued and placed with investors.

Most memories unfortunately are short, but none is shorter than that of the financial mind. Only a year ago, in Wall Street, it was claimed, with some justice, that business was so active throughout the country that capital was lured out of normal investment channels; that the insatiable demands of general business for loanable capital deprived the financial markets of their share—a share warranted by the very corporate profits which business activity produced. On the other hand, some of the North claimed that Wall Street already had absorbed more than its share of the available bank credits of the country in speculation, in consequence of which "legitimate business" was deprived of the supply of loanable capital which was employed in investment and speculation, and to that extent general business activity was denied the possibility of further expansion. Some of us, the counter claims represent, on one side, that increasing corporate profits demanded and justified a larger investment of capital in securities, and that a reasonable portion of the available capital of the country should be permitted to remain in the financial markets; and, on the other side, if it were denied, general business should have practically all of the available capital at its disposal, as matter what happened in consequence to the markets for securities. There was a fierce competition for capital, the supply of which in proportion to the need for it, through causes which I have already referred to, had become dangerously deficient.

To discuss at length the relative merits of such contentions would be idle. It will be sufficient to say that the needs of the investment markets for capital are quite as "legitimate" as those of business, for it is to invested capital in corporate securities that we are indebted for the vast possibilities of conducting enterprises in the corporate form. In any event, the final decision in a case of competition such as has just been referred to rests, not on the relative rights or privileges of the parties, but is settled by the workings of natural laws. Last year general business came off temporarily victorious in the struggle, and capital was withdrawn from securities in such volume that severe declines in prices

ensued. This meant simply that general business could stand longer the tension of high money rates than could the securities markets—or, put differently, that the manufacturer and the merchant could afford to pay high money rates so long as their profits were large, while the owner of securities found it to his advantage to sell securities which yielded him only comparatively low income returns and loan the money to the manufacturer and the merchant. But last year the tension in the money market finally became too great even for the manufacturer and the merchant to bear. They had to cut down their production and curtail their incomes.

Exactly opposite conditions now exist in the money market. The low has fallen the demand for capital, and so large have become the surplus reserves of the banks, that if one's credit is good, loan accommodations may be had almost for the asking. For a month or two so pervasive seemed the gloom throughout financial and business circles that capital started across the Atlantic in the form of gold exports, to find employment there. But the larger corporations, which a year ago found it impossible to issue new securities, except at ruinous sacrifices, have begun to avail themselves of the exceptional opportunity afforded by a plethora of idle money.

Post-pandemic phenomena usually are as similar in nature as those of pandemics themselves. Consequently certain analogies may be made with safety, and conclusions drawn with some degree of accuracy. In many respects, indeed, such, for example, as the absence of interest as to the stimulus of value or apprehension as to the sound financial condition of the government, last year's panic bears a closer resemblance to the troubles of 1903 than it does to those of either 1873 or 1901. It differs from 1903 chiefly in its greater violence. Assuming, therefore, that the analogy of last year with 1903 is a thoroughly safe one to make, except as to the violence of the disturbance, similar phenomena may be expected to follow this year, differing in the degree of their intensity.

It cannot be said that the depression of 1903 was over until well into 1904. Yet a distinctive feature of January, 1904, in the financial markets was the activity and strength in bonds. During February and March the movement of funds from the interior to the reserve cities made money rates very rare, in April bringing about a great abundance of cash in the New York banks and the beginning of gold exports. During April and May gold exports aggregated \$50,000,000, yet in the latter month fell nearly at New York reached the very low figure of one-half of one per cent. Money piled up in the banks in the reserve centres until checked by the crop-maturing demands of the autumn. On August 29, 1904, the surplus reserves of the New York banks reached \$200,000,000, the highest level of the year.

Money rates remained easy during the whole of 1904 in spite of gold exports which continued intermittently throughout the year. New bond issues began in January, and for the year the output of bonds, notes, and stocks to raise new capital, according to the listing statistics of the New York Stock Exchange, reached a total of \$630,445,520, against a similar total in 1903 of \$364,437,250. Railroad and industrial corporations in 1904, as they have just begun to do again, took the opportunity afforded by a plethora of loanable capital to borrow advantageously. It is not, however, so much with the fact of heavy borrowing by corporations in 1904 and 1905, following periods in which they could not borrow at all, or at extremely high rates, that we are chiefly concerned. It is rather with what corporate borrowing meant for industry and trade in 1904, and what the beginning of borrowing now may mean for industry and trade this year.

In 1904, as was shown in tabulated form in a recent number of HANSEN'S WEEKLY, the total crops of the United States in both bonds and farm values in December 1 were larger than in 1903. It has just been shown above that new bond and stock issues in 1904, exclusive of bonds and stocks issued in exchange for old securities, were about \$200,000,000 larger than in 1903. This history has now proved the fact that recovery from the depression of 1903 began in the following year. What further fact that recovery should properly be ascribed to the good crops of the year and what portion to the renewed purchasing power which the corporations derived from the proceeds of bond and stock sales is difficult to measure. But such undoubtedly was effective in some degree.

To-day the crop outlook, so far as the season has advanced, is very good, and the corporations have begun to issue securities on a scale which, if continued throughout the year, will surpass the figures of 1904. In 1904 the plethora in the money market, resulting from stagnation in business followed by the previous year's depression, enabled the corporations through their borrowings to increase their consuming power, and together with good crops brought about complete recovery in industry and trade. We have to-day at least the promise of both of these means of recovery that proved effective in the past. In the increased consuming power of the corporations lies the real significance of the recent new bond, note, and stock issues.

The Presidential Skirmish Line

AN IMPARTIAL CONSIDERATION OF THE PERSONALITIES AND TACTICAL STRENGTH OF THOSE IN THE VANGUARD OF THE COLUMNS ADVANCING UPON THE NATIONAL CONVENTIONS

I.—ROOSEVELT—TAFT—HUGHES

By FREDERICK BOYD STEVENSON

many elements enter into a Presidential campaign, the political scenes are of such a shifting nature, and that magnetic something which no one comprehends or controls—the temper of the people—is so subject to whimsical variance, that the seemingly self-evident truth of today becomes the palpable absurdity of tomorrow. But it is this popular sentiment—it is properly called the public pulse—this subtle, unbindable, undeviating, which, after all, sways the election and seats in the Presidential chair the man whom the great bulk of the American people want seated there. Just now this mysterious underdrift is without form. The political meteorites of which it is composed are drifting in shapeless masses. They reel but the magnetic centre to draw them into a comprehensive continuity.

Each little act that is done to-day, each little word that is spoken to-day, strengthens or weakens this or that man's Presidential possibilities, though at the time it may be imperceptible. But when the psychological moment arrives, the political meteorites now floating in space will become united in one irresistible whole.

Who is the strongest man for the coming race?

Let us look at the men in the order in which they seem to come naturally. There is Roosevelt, for instance; his personality is felt in every more or less preliminary Presidential skirmish. There are three classes of people who view Roosevelt from three distinct angles. The first class that he is taken the Saviour; the second, that he is sure the Destroyer; and the third that he is Broken the All in One. But whether one be a Roosevelt man or an anti-Roosevelt man, one must admit that Roosevelt has a hold on the people. How does he get his hold?

Not long ago I was in the Executive office. Mr. Taft entered and announced to the President that an old lady was in the waiting-room, was very desirous of seeing him, and could wait only a few moments, as she was obliged to leave the city on a certain train.

"I'll see her now," said the President, quickly and pleasantly. And the old lady was ushered in. She stood at the threshold for a moment, undecided as to just what was the proper thing to do, but the President relieved her of all uncertainty on this score, for he hastened toward her with his hands extended, and he greeted in his strong grip her two hard working hands. The ice was broken, and, with a harmonious din of soft response, made more attractive by the soothing accompaniment of a rich, hoarse laugh, the old lady exclaimed:

"Ye are the first real President ever I see in my life, Mister Roosevelt, and I told them all at home I was bound to come and see you, and I told them I was going to tell you that, though we are all Democrats in our family, we are all going to vote for you if I have my say, and I think I have it."

All this time President Roosevelt had been vigorously shaking her hands up and down and beaming upon her as only he can beam. When she concluded her speech he jerked out, in his rapid, punctuating and distinct manner:

"Well, it is a real pity of you to say that!"

And that old lady went home imbued with the idea that she was very close to Theodore Roosevelt, and she was, for Roosevelt's emotions are never assumed. He may be right, or he may be wrong, but every one who has ever met him, and every one who has ever come under the spell of his rough magnetism, feels intuitively that the man is sincere. His egotism is an honest egotism. His fight is the fight in the open. His bravery is open. He has his prejudices—as all men have theirs. Perhaps he is reckless, but, if he is, his recklessness is tempered with an earnest spirit to investigate his subject and to give to every one an equal chance.

Only the other day I was talking with one of the best known and most competent railroad officials in the country. He believed, he said, that the methods of the administration had, to a great extent, made some few investors in stocks timid, but he also frankly asserted that these methods would not have been resented to if wilder speculators and unscrupulous operators had not presented the opportunity for the administration to act. The most casual observer in things political cannot fail to have noticed that all of Theodore Roosevelt's adroitness is now concentrated in continuing for another four years the policies which have brought down upon his head the cyclonic criticism of those who disapprove of them. This trend he hopes to bring about by forcing his best political process to secure the Presidential nomination of William H. Taft.

And what of Taft?

In the beginning of Taft's candidacy a quiet opinion prevailed among those who had given thought to the subject that Taft was allowing himself to be made a weathercock—to show which way the political wind was blowing—that he stood in a position to run, or not to run, as Roosevelt willed. Before he became an avowed candidate, he expressed himself openly as desiring a business-like leadership. But Taft should never be considered in the nature of a tool, ready to forge his personal ambitions for the mere sake of accommodating a friend, although his great nature is

Theodore Roosevelt

"ALL OF HIS ACTIVENESS IN NEW YORK ENDED IN 1907—END HIS TERM FOR ANOTHER FOUR YEARS"

abounding. The one great argument, that which is to him the most convincing, is his inordinate sense of duty. This sense of duty was shown back in the McKinley administration. Taft's personal desire then was to go to the Supreme Court bench; he was on the eve, he thought, of having this wish gratified, and McKinley expected to put him there; but the exigencies of the administration led to other fields of endeavor. On a certain occasion President McKinley and Secretary of State Day were traveling together to Canton, when McKinley said:

"I need a good man to head the Philippine Commission. I want a man who is honest, strong mentally and physically, tactful, and of good address."

"You have named William H. Taft," said Day.

Taft was called to Washington and met President McKinley and Mr. Root, then Secretary of War, in the President's private office. Mr. Root was the spokesman. He knew there was soon to be a vacancy on the Supreme Court bench which Taft would be only too glad to take. Root approached him in this way:

"Judge Taft," said he, "we need you in the Philippines. We know of your ambition to go on the Supreme Court bench. You are therefore confronted with two propositions—an easy one and a hard one. You could remain upon the Supreme Court bench for life. That is the easy proposition. In the Philippines you may be wrecked physically by disease and die at your post; you may work faithfully and hard, but still be damned by the public. However, by going to the Philippines, we believe you will be the savior of the inhabitants there and advance them centuries in civilization. If you go to the Philippines, you must resign your position on the Federal Court bench. The opportunity of going on the Supreme Court bench may never again come to you. It is a hard proposition, Judge Taft. What is your choice?"

"I shall go to the Philippines," said Taft.

Within the last year the cherished Supreme Court bench again seemed to be within the reach of Taft. Another vacancy arose. Another answer was given which was characteristic of the man.

A few days before Taft came out as a Presidential candidate. I had a long talk with him in his private office in Washington. He talked lively to me of him, and in that talk the best—I might say the "big"—side of the man was revealed.

Taft has a way—you can't exactly analyze it—that makes him popular; and, at the same time, you do not feel that he is striving for popularity. He is naturally cordial, and the years have not changed this cordiality in him, although the dignity of his position and the increasing touch of his duties keep him a little further removed from even his old comrades than he appeared to them in those Yale days when they called him "Bill" and, when unusually intimate, "foul" Taft. But it is the enormous amount of work the Secretary finds it necessary to do that keeps him aloof from you. He is unquestionably the loquacious man in the cabinet, and it is his very good nature and the facility with which he turns out work, together with his tact in handling a disagreeable job, that in the past caused the President to "unload" upon him. If there were a certain ticklish act of diplomacy to be performed, President Roosevelt said, "I'll get Taft to do it." If a delegation called upon the President and requested him to make a speech at Dinkysville, the President smiled and said he would be delighted, but such and such was the case, adding, however, as he noted the gloom of his visitors, "But I'll send Taft." And Taft just laughed—and Taft can laugh—and said, "All right," and no one could tell from his exterior whether he was laughing himself in or not. Thus Taft became known as the handy man of the administration.

Do you wonder that Roosevelt selected him as the best fitted man to carry out the Roosevelt policies?

There are two views of Taft. One is at long range, and the other is at short range. Perhaps most of us have studied him up close that long-range view which is the newspaper. During his political career, Taft has had the tact to keep friendly with the newspapers. In keeping up this friendliness, it was not so much what he said as how he said it. He has always been frank with the correspondents at Washington, and when he desired not to be quoted that frankness has been invariably respected.

In a short-range view of Secretary Taft you will see a big man standing near the door of his private office as you enter. He wears a black derby but settled well back on his head. He is dressed in a dark gray suit with a frock coat. In one hand he has a bunch of papers, which he keeps in his hands, and with the other, while he greets you with a laugh and the inevitable, "How d'ye do?" He talks to you and keeps on glancing at two letters at a time. He reads more letters, listens, answers your question, and laughs till his hat is tilted so far back on his head that you fear it will fall. His secretary comes in and hands a card to him. Taft reads it before it is out of the secretary's hand, and says, quickly:

"Tell him that that matter has been carefully examined and I will communicate with him this afternoon," and in the same breath he turns to you and says, "Oh yes; that's so, that's so."

The private secretary comes in with more letters. Taft receives them, says, "All right," and adds them to those already in his hand. He looks at his watch, still talking to you, and then adds: "I must go to cabinet meeting, but I will see you at nine sharp to-morrow morning."

And at as time during the call do you feel that Taft has hurried you, and when you see him on the morrow the probabilities are that he will tell you frankly whatever you desire to know, if he has faith in your conversation and friendship. But whenever you see him, he first of all impresses you with the busy life he leads. Taft has a remarkable capacity for work. This hard work is necessitated by the many details which he masters and which are not easily acquired, for he is not a brilliant man. But

William Howard Taft

HE HAS TOLD US THAT ROOSEVELT'S POLICIES ARE HIS POLICIES. YOU CAN IMAGINE HOW HE WILL CARRY THEM OUT.

what Taft once acquires, he knows forevermore, and his knowledge, by close study, is varied and practical. Taft is intellectually a strong man, and his most available mental asset is his application and his power of long, hard, and continuous work. When he went to Cuba he entered into every little detail of the situation there. He personally investigated every part of the island, saw every man there who was worth seeing, and read everything about Cuba that had been written that was worth reading. It was the same at the Philippines. It is the same with everything that he undertakes. He has told us himself that Roosevelt's policies are his policies. You can imagine, then, how he will carry out those policies.

Here again the question arises and, like the imaginative ghost of the gifted dramatist, will not down: What will Theodore Roosevelt do in the event that Taft cannot be nominated by the Republican convention?

A year ago there was a ground-swell for Roosevelt and a third term. There was a mighty third-term movement. It relied on mass and grew stronger day by day. It was without form or organization, but from its nebulous particles there appeared to be evolving a solidifying mass that bade fair to sweep all before it. A year ago it was well under way in Washington. It spread to the West, and everywhere one met it in the East. Men in a position to know admitted that it was getting beyond the control of the President.

"There are some things," said one of these men—a man who is very close to the administration—"that Mr. Roosevelt cannot dictate."

At that time a Democratic leader in a New England State made the remark that Roosevelt was the one man for President in 1912.

He has declared again and again in most positive terms that he would not accept a nomination for a third term," said a listener. "Mr. Roosevelt could not be induced to take it."

"Mr. Roosevelt has nothing to say about it," was the firm response.

Soon after that Andrew Carnegie, on his arrival in New York from abroad, suggested that if the national Republican convention should resolve that there be no other standard-bearer but Roosevelt, and after nominating him should adjourn, a contingency would arise, and if the President failed to respond to it he would be indirect revolt to his country. This view of the situation showed the drift of public opinion at that time. To-day another contingency is arising. Another man has stepped into the line-light—another man whom some are insisting is as big a man as Roosevelt.

This man is Charles Evans Hughes, Governor of New York. Will Hughes be strong enough in the convention to overpower Taft, and, if so, will Roosevelt's supporters, should they see that

Taft must go down in defeat, spring the name of Roosevelt and nominate him for a third term over all comers?

That is a possibility to take note of. But first let us look at Hughes. Hughes's maiden effort in politics, when he was conducting his gubernatorial campaign, gives the index to his subsequent political career. I had a good opportunity to study Hughes in that campaign, for I accompanied him on his first trip up-State and was in close touch with his methods until his successful close. In the beginning of that political career Hughes made this statement:

"I think you will know I mean it when I say that had I not believed it was the honest desire of the people of the State for me to accept the nomination for Governor I would not have accepted it. You are entitled to have me say, and I am glad to be able to say unreservedly, that I have no political obligations to any person or thing, and much as I feel the responsibility that is to be assumed I can look you in the eyes and tell you that it will be assumed with the sole desire and the sole purpose in serve your interests. I am anxious, every true friend of progress is anxious, that we should go forward in the right way with deliberation and without disorder, that we should steadily make progress, not with noise, but in fact, and with sure steps."

When he became the politician, he did not forget the methods of the business man. The private stateroom in his car up-State was turned into an office. Every day he was cluttered with two secretaries and went through his morning mail and wrote and answered letters and dictated speeches with a regularity that is born of long years training in routine. No matter what the occasion may be, Hughes never neglects to be precise. He is the same cool-headed—some say cold-blooded—business man whether he is at his desk in his quiet office or on a campaign car behind a locomotive covering fifty or sixty miles of track an hour. The first thing that impresses you when you meet Hughes is that he is strictly businesslike. When you try to analyze him, you feel that there is little of the magnetic about him. He looks at you in a calculating way, giving strict attention to what you say, measuring each word like a country merchant measuring a piece of cloth. Somehow or other he creates the impression that he is suspicious of you. But whether this impression is imaginary or founded on fact, one thing is undoubtedly true—no one seems to have succeeded in getting very close to Hughes; that is to say, close enough to enjoy his uncolored confidence, and to possess a knowledge of the inner desires and the ambitions of the man. Until he made his speech before the Republican Club of New York, he was a sphinx to the politicians, and now, even after he has declared himself in general terms, he still remains an enigma. One never knows what Hughes is going to do next. All efforts to draw him out prove futile. To all—even to his most intimate friends—he was absolutely silent on the subject of the Presidency, and yet, while he had not said one word as to his candidacy, he

became, next to Taft, the most prominent candidate in the long list of those mentioned in this connection. He himself refused to talk on the subject, and he had no spokesman, no one who could, with any evidence of authority, drop the slightest hint one way or the other.

Hughes's political opportunity came at the time he forced the passage of the Public Utilities bill in the New York Legislature just at this time, when the bill was being eagerly watched—not in New York State alone, but in all States as a model for other legislatures—Hughes came within the vision of the great eye of the public. And just at this time, when his opponents in the Assembly (they called them the "Old Guard"; men composed of the abridged politicians of both parties, who were banded together to thwart all legislation that was a menace, or the suggestion of a menace, to certain well-affected business enterprises) had ranged themselves, irrespective of partisan lines, to encompass his everlasting political downfall—just at this time the people cried:

"Here's another Roosevelt!"

And day by day Hughes sat in the Governor's chair, pounding away at the Legislature. And day by day there was the "Old Guard" with never a bridge to it. And still Hughes sat there with his long, serious face, pounding away. And the "Old Guard" still had its claws in the ground.

"Use the Big Stick!" cried the press. "Come the Roosevelt act on them. Shut off their patronage!"

But Hughes looked grim and laid down the Governor's chair. It was at this time that I called on him, I had seen him in the heat of the political campaign against Hearst. What kind of a man did he seem to be in this battle with the "Old Guard"?

Here he was barely installed in his office—a novice in politics and a novice in official life; and there were the radicals and the conservatives glaring.

There had been Hearst—dubbed as an anarchist—with reform measures in his mouth.

Here was Hughes, the conservative, with reform measures in action.

There was Hearst charging Hughes with being a "corporation's man."

Here was Hughes seemingly bottling up the corporations.

Day by day he sat in his office pounding away at the Legislature. He did not use the Big Stick, but he did adopt another Rooseveltian method—he appealed to the people, and the Public Service bill was passed. And upon the passage of this bill Hughes began to loom as a Presidential candidate, though he himself ignored such a situation.

The day that I called on him in the midst of his fight he said to me:

"I am here saving wood."

"Is there not need for other men in the country to save wood?" I asked.

"There is," said he.

And between that question and that answer lies the whole scope of the Governor's rule.

The first impression one gets of Hughes is his frankness in official acts, and his secretiveness in his private affairs. If he seems fit to inform you on a certain matter, he does so without equivocation. If he does not want to inform you, he says so bluntly. He is not a man whom one would call a "good fellow." Sometimes on his campaign tour he attempted to make jokes, but in this direction he was a failure. He is at his best when serious. He has fine argumentative power, being a good lawyer. He gets a firm grasp of his subject, and is an adept in worrying out facts on a cross-examination.

Hughes, in many respects, has taken the part of a reformer. He has stood more or less in that light since he has been Governor. The anti-Roosevelt forces realize the popularity of Roosevelt. They know that Roosevelt gained this popularity by "doing things," and they seek, therefore, to secure a candidate who also has the reputation of "doing things" or being willing to "do things." Whether he has done them or will do them or will not do them matters little, so long as he has the name of doing them.

Hughes has made a good start. His failure is at this time unknown. He has been careful not to oppose Roosevelt's policies, he has even praised Roosevelt in general terms. But he is not too friendly with Roosevelt. While he stands before the people as a champion of their rights, he has no current interest in the rights of the corporations, as was evidenced in his vote of the two cent railway rate bill. He is the best possibility for the anti-Roosevelt forces.

It was the people and not the politicians who elected Hughes. The people elected him because they feared Hearst. Nine-tenths of the politicians were opposed to his nomination, and had it not been for the final word of Roosevelt he never would have been nominated. Hughes's idea of political independence has prevented him from acknowledging any obligation for this service, just as he refuses to acknowledge any pull or favoritism or rewards in the conduct of his office as chief executive of the State. Hughes is unlike any other man who ever held public office. He lacks the stifiety of Taft; he lacks the cunning of Foraker, and the diplomacy of Fairbanks. He is just Hughes; and Hughes to-day, as he was in those days in Albany when he was pounding the "Old Guard," is invulnerable.

Hughes may as such interference promises as Hearst made, but when he was elected he proceeded to put into force some of the very reforms that Hearst had advocated. The nearly took Hearst off his feet by recommending a revision of the ballots in the last Mayoralty election in New York city which Hearst has been bitterly combating, and in advocating the Public Utilities bill. And so much this bill will ultimately benefit the people is still problematical.

Charles Evans Hughes

"HE LAID THE FOUNDATION OF TAFT. HE WENT THE OTHER WAY IN FORAKER, AND THE REFORMER OF FAIRBANKS."

"At Liberty"

ADVENTURES IN A FRIENDLY PORT WITH THE SHORE PATROL DURING THE HOMEWARD RUN OF THE BATTLESHIP FLEET

By ROBERT DUNN

SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY"

U. S. S. "RHODE ISLAND," MANAGUA, N. H., MARCH 21.
GIVEN a choice of amusement in any port the fleet visits, and the wise man will elect to accompany the shore patrol.

Eight officers (four commissioned, four midshipmen), two from a ship of each division, report in the morning on the flag-ship; land with sixteen masters-at-arms (juggling quite unnecessary handicraft, to work with the local police as cops, counselors, and general balance-wheel for the person of Mr. Bluejacket, issued ashore duty to the number of 2000. The ranking officer plants himself at police headquarters. The rest spread out and around through the sailorman's haunts. Precisely their legal authority over enlisted men on foreign soil—a bluejacket's "rights" in attempting desertion, say, or to civil trial in case of crime—I have never grasped, because such cases hardly arise with our men. The patrol's authority seems to be absolute,

THE FIRST DIVISION OF THE "RHODE ISLAND," INCLUDING THE GUN-CREW'S OF THE FORWARD TURRETS

by grace of the city authorities: they would yield the indifference over to it, to receive ships' justice.

The scene is inevitable. The streets that rib the howling water-fronts of the semipitiful of the world respect neither climate nor tongue. They attract about the only sort of utter human uniformity which civilization—or the lack of it—has attained yet. Aden, Athens, Ajia, offer the same hospitable squalor; those dusty, small drink-shops, with cognac, Scotch whiskey, and the land's native drink on the shelves, four shaggy taliahs, had cigars under a square of glass. On the listel that hangs over dust and cobwebs is scrawled, "Sailor Joe's" or "The White Palace," or plain "Lodging," whether the street is black and smoggy with the paper signs of China, or a crowd with such Arab markings as calvados cigarette boxes, Seving Shanghai, Singapore, Port Said, is thus to the bluejacket only revolting Rio, Punta Arenas, Callao. Ever the English glad-hand, the water-eyed leechmonger on the corner, elud as one down-and-out should be; the beggar, the hairless dog. Locality loses distinctive color; life, like its setting, becomes impersonal.

No you go with an officer friend in his black web belt and empty revolver case ("the" patrol, for present purposes), rather hating in on his duty, perhaps, and quite useless except in forecloses with a native who may presume on some woman's cash liberality. For bluejacket, with a man's body and a boy's mind, is loosed from a cage of steel and routine, upon antipathetic, quaint delights, to be stricken, therefore, by the acute view of freedom and adventure. He is "on liberty," and all which that means in traditions, from those ancient and rough, up to extra of the modern, practiced gentleman-sailor, who is hungered for postcards and camera films even than for beer.

A tubby Frenchman plunges out of his den at us. He lived in New York for two years; yes, two years. What will you drink? Cerveau (cheer), cognac? No, thanks; and not wholly because of the line of silent list-dart (ashore, "bluejacket" is a euphemism for him) who fall back from the corner, saluting. We will assume that we did take the cigar, but only because it was a pleasure to find the flowery alternative for something "on the house" current even in Peru. Dame civilization is open enough, nowadays. At this juncture the tubby wife emerges from an

interior open to the sky, and in her hand she holds a 4th Confederate bill!

Now, to analyze this hospitality, do not look the gift horses in the mouth end. Yes, yes, and the *interior* who gave her the naughty money got twenty *soles* in change for it, just as if it were real. Then our interminable questions, protests, soothing. The culprit had lettered on his hat last: A-C-N-T-F, N-A-R-T-F, N-A-R-T-F. You get that after infinite effort. And it restricts the guilt so narrowly, to the Kentucky, *Kentucky*, or *Kentucky*—some 1500 men! Then you deal very strong on sympathy. You ask the uniforms about you if they saw the *dear*. "No, sir," they answer most humbly. "We only just come in here," while assuming that icy indifference at which the bluejacket is past master when he wants to be. That is final, whether any of them saw the trade or not, for theirs is the privilege to stand by one another in social obligations. It is part of the price we pay for their unquestioning fidelity in the interior injustices for which we drill them.

The Frenchman executes a sudden about and puts the bill into his cash-register—none, he has a cash-register. It may have some intrinsic value at the time of the next revolution, if only as the medal for a die of the new national currency.

"He couldn't have been from the *Kentucky*," reasons the patrol. "She's calling all to-day,"—which means, as every one should know, that all hands from the line down turn to with the collar, and no one can go ashore. Thus the affair goes down to history as one of the great unsolved mysteries of international crime.

A bristle-headed, gaunt-faced outcast slinks up by the Italian drug-store on the corner. You get the weird whiff of a three weeks' sojourn, but he salutes. "Hi thought ye might be interested," he says with cockney humility. "Hi was parading last night in a 'dred up in Lima (pron. *Lay-ma*), and in the hapless department, sir, I 'ears four o' your men a-talking, air. Planning to take the mail steamer to Limaquay, they was to desert, sir! It's no trouble for me to tell you, so I comes all the way down 'ere, at my own expense, to give you the address of the lodgings. I think if you run right up there you'll get 'em in time, sir."

He has handed us a large white card. It states in English the name and location of a Lima lodging-house, evidently kept by a German. We ask what ship the four bluejackets were from.

"I could peer through the door, sir,"—he hunches his shoulders whispering for an effect of shy-dog mystery. "They were from the *Johnson*,"—triumphantly.

Now, that is the patrol's ship. "I'll look this up," says he with

GUN CAPTAIN "TOMMY" WATSON (ON RIGHT) PREPARING FOR "MORRIS TUBE" PRACTICE

TARGET PRACTICE WITH "MORRIS TUBE," WHICH SIMULATES ALL THE CONDITIONS OF ACTUAL FIRING WITH THE BIG GUNS

a curious drawl, and thanks the man somewhat coldly. We move on, but our volunteer detective follows.

"Hi habemus! Hi do favors for fellow white men, thank you, no matter what trouble it is for me," he jerks out. "Particular if Yankee or English, and never ask for nothing in return, thank you."

"Get out! Beat it!" The patrol turns on him, losing patience.

CALIFORNIA'S GREAT WELCOME TO THE FLEET

"You see them two new Peru cruisers in the harbor, sir?"—he isn't to be shaken. "I brought them out from the Clyde, thank you, and as he said, at two quid a month, sir—" He lingers. For the first time he sees that the gag is hopeless. He bursts into vituperation of a *course-ness* which only the dock streets of the world's ports know, and to go on.

"Every man from our ship reported safe aboard last night," observes the patrician, reading the hotel card and scattering it in the dust. "When these leeches come to put up a game on me, I think how the bluejackets must get grugged! It doesn't make me so hot with them for passing bad money in these dumps."

But Bluejacket is not an easy man to fool. Your officer goes ashore for a horseback ride, to find all the best mounts in town snatched up by the lads in white with the bag blue collars. And ride they can, many of them, with the close knee and easy limboes of the cowboys they have been.

And maybe the officer needs a horse badly, being ashore on special intelligence duty. "Blackshaw work," he calls it—which means securing the baggage, pumping officials, reading maps to put on file, as the absurd event that some day that innocent little bag may need alien defense at La Monroe.

But stamps and post-cards have the call on the two thousand, just rarely encounter a swarthy intrusion into the street from between swinging doors, and then the argument is generally over the right change for the hourly eagle on it. Or a thrifty enterer, because one liberty crowd guilefully gave up two pesos each for dinner, imagines he can charge the next crowd four apiece for supper, mindless that the word has been passed along that you can eat in Manuel's place for two. You go in. Sometimes, but rarely, Manuel sticks to his bluff with interlocking elbows and rapid-fire tiaclicisms; then, just despatch scornful and roadstead bill floozy on his way long for some of the same little marionettes as the red and green of a French soldier, who would call himself a cop at head quarters. Arriving, he has a quick, seductive effect; you collect an eclectic payment for the meal from Bill and his friends, all in a pin-dropping silence, broken only by their *active* racy cynicism, and bows and contrived from the man-nose to come up to the station and be decorated by the republic.

At such times you imagine yourself standing over a blazing line of red antagonism. You note the mutual trust of officer and man. The bluejacket adopts an easy citizen-to-citizen intimacy, which ashore is as gratifying to his superior as aboard ship it would be impossible. It is a fusion of affection and respect, very patly shaded with all sorts of native innuendo. The men are quite sure of themselves. That must be very provoking to the native *tertius* quid of an argument. And then the patrol may say, swelling his chest, "If ever I'm in trouble ashore, I'd rather have a bunch of bluejackets stand by me than any crowd of old friends I thought I knew." And he proceeds to tell you of one once encountered a mix-up in Funchal, or Goa, and was rescued by his crew. Which, of course, was in the rough days of the "Old Navy," aboard the old *Arctura*, when we all went around the Horn in '47.

Once a hefty dame gave us a hurry call into a Punta Arenas dance saloon. We passed down a narrow hall, given open by both the doors and the windows of the rooms. The "professor" stopped strumming his *consonance* on the piano; she indicated one of the two lamp brackets hanging from the ceiling. It was sky a whole light—broken by one of the frown of flat-bed, so she said. And she wanted five pesos for that.

"Oh, it ain't broke, sir," a man from the patrol's lip reassured me in the most lovely accent. "A taster's head here hit it while he was dancing, and spilled the gadget to the deck. Only the chimney just bud, but the lady took the lamp away before she went out for you."

That seemed an easy one to settle, and the tactful thing to say, as the patrol did I guess, still have to charge that up to profit and loss, madam. And this with no strenuous effort to use a language she could understand. I by the way, anything underfoot, even ashore, is the "deck." You have to get used to that with seafarers. And it is something to get on a railroad train with

an officer who reaches across to the window and says, "See if we can't open this airport here." As for "gadget"—it's everything from a screw-eye to a toothbrush.)

But we had reckoned without our host, who came bounding through the door from the bar, setting an alarm, that this is a pleasant chronicle, and the few of misunderstanding did not go off, then and there. Yet no human storm ever quivered in which I felt safer, among those reasonable, white, loyal faces. The lady got half a peso by arbitration, and then—we owed the place.

A tall, husky youth from the Virginia kept accosting me and leeching: "Now, sir, either you bang the box and the dancer, or I bang the box and the dancer. Understand?" A white-headed boy, all by himself in a corner, was singing "mother" songs to himself, solemnly attitudinizing the words as they do on the variety stage.

But no one was the least intoxicated. As for the matter of that, one might as well face the issue. Who can keep men, suddenly fired from a long Spanish rifle, from the bar? Think of sailor traditions of "rough house" in foreign ports! Perhaps a very small proportion—say ten per cent.—do indulge, but not one per cent. show the least effect of it to the most penetrating eye. And the patrol is on hand to deal with the worst, remember. On this cruise, praise of his conduct ashore has been larded so thickly on the bluejackets that have four suspicious would be proud that his friends, in the *Shakroperata* sense, have too much protested. But it has been true, every word of it. A Scotch sheepherder in Sandy Point said to me with a sad long face: "I came in a hundred miles from the range, just to see the rocs your boys would get into. And I haven't seen one. What's the matter with them? Ain't they wilful?" The gratuitous warning to be alert and ladylike, often read from the quarterdeck to a liberty party bound ashore, seems to the layman hardly appreciative and fair. He notices that in the larger ports, where there have been fights to take in, bluejackets' behavior has been best, showing that to exercise is a very secondary refuge. That fact in Rio, so publicly exaggerated, began at an adjoining table, among four Brazilians. Whatever their argument was, one of them threw an empty soda bottle at another. It accidentally hit one of our men who had his back turned. He and his friends naturally thought that they had been assaulted, and began to return compliments, as any of us, not mollified, would have done.

But it is at a bull-fight that Mr. Bluejacket comes most firmly into his American own. Probably it is unfair to judge one from a first sight;—and that with built-in disadvantage. The crowd would be "bowed from the ring" in Madrid—despite your underlying faith that in any physical contest the psychological advantages, at least, should be equal. And that they are not equal in the bull ring, but instead are usually, vulgarly discrepant, is the real key to one's instinctive disgust. The groans and howls, the beautiful (?) ladies cheering with their thumbs turned down, are not what really counts.

In Lima, the bluejackets were invited officially: they went "in" the Peruvian government. And wasn't it something to see them there! Back on rank, hat hats, blue collars, the rest all white, filling the vast semicircle under the roof of the ancient, mud-brick amphitheatre, all regular as the design on a big piece of summer gingham. But you felt involuntarily a sort of promissory guilt—something like that which a mother may experience when she lets her daughter first go to a problem play. It quite swamped your sense of pride in the impression you like to think the sailor man makes when asked and solemnly treated.

He kept very quiet; his persistent, extraordinary stolidism became appreciative. Maybe he, too, was wondering why, when a matador smothered the big brute's lure in a faded purple cape, so that the bull had to pause full ten seconds to shake it off, either his show wits, and plunge which you are told, or the long-legged little man in gold eyeglasses as brave and skilful to escape. He could have snarled off. When a crowd of them taunted enough gumption out of a beast so that he really scampered after one of the mazzinis, the matador dodged between a slit into

"PIND POND" PRACTICE (THE SAILOR VERMAYUTAL FOR MODERN-TIME EXERCISES) WITH THE "RHODE ISLAND'S" 6-POLYDOR

TWO THOUSAND AMERICAN BLUEJACKETS AND MATRISER WATCHING A BULL FIGHT AT LIMA, PERU

a little box at the ringside. Bravos—from the natives. A lithe boy kicks a fat boy, then leaps on the back fence and thumbs his nose at fat boy. Spurt! No doubt! No wonder Mr. bluejacket was morally debilitated. . . . And in Heaven's name, if they wanted to hurt the beast, why didn't the pincider, instead of musing on lyrics and then hurling his long limbs at the bull's neck (still he looked like a peregrine with half his quills moulted), sting the beast in much more vital and painful parts! . . . But the bluejackets were beginning to cheer, rumblingly, mildly, from scattered quarters. Just then, one of the glittering legs rushed out with a vaulting pole, tried to soar over the horse's horns, and fell in the dust, so that it looked a creak for the bull. Then bluejacket opened his lungs. He was cheering the bull! Oh course he was. What else was there to cheer?

At the same moment an officer in the box in front of me thumped his chair and started for the exit, growling to himself. "I'll raze up and get away from here, but when it comes to—" I heard him say, but just as he was outside. The man was pale with the blanch of anger, which is peculiar to itself. The patrol said throatily beside me, "That's the assistant surgeon on the —"

He really should have stayed. Presently a fellow in a prison-colored jacket, orange trousers, and jack-boots—mind you, for the bull has at least a keener sense of color than his torturers—was being led hobbling under the grand stand. The starboard horse of Shesky, so named, as the programme said, "in honor of Admiral Sperry," had grazed him on the chest. Then, as a further compliment, a pincider chose to stick the beast with two quills that unsettled the Stars and Stripes as soon as they entered his flesh. A dead silence, no comment of any kind. But, ah! one of them sagged, fell into the dust, and Mr. Bull stepped on it. Quick as a flash a bluejacket opposite us vaulted into the arena, tearing toward that flag, but lost off, fell trousers flapping comically. He wasn't going to see his dog trampled on! He got the elvers all right. And although it was against the rules for any spectator to enter the arena, his officers cheered him, too.

We heard later that a pincider was killed; a horn went into his lozenge and came out of his cheek. Well, even a pincider should have been guided by that unimpassioned throng to bluff out a risk. We had left after the third bull, and then the gingham design of seated bluejackets was all gone. We left after the spangled man, making sure that his beast was helpless from the quills in his neck, snaked up behind, paused, and plunged a knife in, and a pair of horses reared in, dragging half a railway track, upon which they tossed the carcass, and raced out—in the long smear of dust which always aroused the Llaneros to their most exquisite frenzy.

Literary is over at eight o'clock. Shortly after seven, you begin to clear the streets around the landing. Sneering a master at arms, the patrol says, "Round up that crowd we saw just now going in that direction," or, "Take this side of the street, while we drag the places on the other." Lounging along counters, seated in back

rooms, you tell the willing, engrossed boys that time's nearly up and they'd better be footing it. You break upon the most bizarre parties: a crowd playing with a collie dog in some inner courtyard; a big blond man talking to a whole dusky family's supper table, with a mutual heart-to-heart intimacy (and in Spanish); that no one but a bluejacket ever could improvise. Generally they shuffle on quietly asked; sometimes they boldly back trail, whereupon you warn them again; and the patrol remarks: "Well, it's their own fault. They know what's coming to them if they overstay their liberty." Perhaps some old fellow as recalled as a grinner's state thinks it a great joke to give you the slip and then greet you in the next sidewalk, as if the patrol's duty involved playing hide-and-seek with him. "I'm sorry for Sullivan," says the officer. "He's a good man. He ought to know better."

The center of excitement is the plaza at the water's edge. To the returning 2000 and the stolid native throngs that imperceptibly crowd the railings of the quay, the natives incessantly screeching the wailing letters of their particular ships; visitors to them looking for the right boat, and nearly driving the launch-master (one of the patrol stationed at the landing) distracted. Why, only the betting ring at Jamaica, or Soldier's Field of a November Saturday, is like it.

A big, graying-mouthed audience surrounds three marines who are eke-dancing in the barflete (sidley) terminal. A throng eddies from under the trees around old Holivar's statue, where a sailor has had his jacket picked, and a soldier-cop is leading away the culprit. Two or three boys—only two or three—are asleep prone on the stone steps of the quay, but each has a mate who guards him jealously. A ponderous creature in the gray sea-shell clothes (like civilians) of his ship's team has irresponsibly lost it and needs assistance. He could brush the patrol aside with a finger; still, he daintily respects authority, while negotiating it with humorous obsequy. The crowd closes to its light; the soldier flashes resistance, then sudden docility. And you hear an onlooker from the patrol ship, who knows the patrol's nicknames, snicker aloud. "Crises! I thought 'Dusty' was a gait to paste him one!"

Then for days out on board you note mysterious rappings penetrating to the washroom mess table; you can't locate them, either up in the "dig-house" or down in the torpedo-room. Blue-jackets in that case hammering out the dearest silver of that country into finger rings. You hear that the patrol's sickman, stoker aboard, "Crises! I thought 'Dusty' was a gait to paste him one!" Then for days out on board you note mysterious rappings penetrating to the washroom mess table; you can't locate them, either up in the "dig-house" or down in the torpedo-room. I thought 'Dusty' was a gait to paste him one!"

THE PASSING OF A FAMOUS THEATRE

By CHARLES P. SAWYER

Tearing down the Madison Square Theatre, in West Twenty-fourth Street, New York

THE Madison Square Theatre, for almost half a century one of the most famous playhouses in America, has become a memory treasured affectionately by the older generation of New York's theatre-goers. The theatre in being torn down, sharing the fate of the Fifth Avenue Hotel, whose rear it adjoins. Both buildings are to make way for new business structures.

In 1802 Amos H. Eno built on Twenty-fourth Street, back of the Fifth Avenue Hotel, a hall intended for use as a stock exchange. It was rebuilt and opened in November, 1848, by Charles's minstrels. Two years later, as Brougham's Theatre, it was the scene of a disturbance as the result of which Kelley, at Kelley and Leon's minstrels, was shot. The theatre was then the home of Brougham's company of burlesques. In 1860 James Fisk, Jr., of successful fame, rebuilt the playhouse entirely, and gave it the name of the Fifth Avenue Theatre. For a time the playhouse flourished there; but in August of the same year Augustin Daly began his occupancy of the house, which lasted until January 1, 1873, when the theatre was destroyed by fire. This was a prosperous season at the little theatre; for in Daly's company were James Lewis, Clara Morris, Mrs. L. H. Gilbert, Fanny Davenport, and other players scarcely less distinguished. "Saratoga" and "Article 47" then had their notable runs.

In 1877 the house was rebuilt and occupied for a time by Robert Heller, the "magician." In 1878 it was known as "Minnie Canning's Drawing-room Theatre." In 1879 the house was rebuilt with a double stage, and under the management of J. Steele Mackaye entered upon a career of remarkable prosperity. It was then called, for the first time, the Madison Square Theatre, and it was during this period of its existence that the famous run of "Hans Kretz" occurred. This play was expected to last a week; it ran for 481 consecutive performances. Georgia Cuyman, as leading woman, made there her first successes. As H. Palmer had the house from 1881 till 1891, when Charles H. Hoy began his tenancy, revivifying the theatre after his own name. Under Hoy the house enjoyed again a period of marked good fortune, beginning with the production of "A Trip to Chinatown." Hoy's tenancy ended in 1897, and since then the house has had numerous lessees, and has known many failures and a few successes. But for almost a generation—from 1897 till 1907—the pretty little theatre enjoyed a reign of prosperity almost unequalled in the history of the American stage.

England's New Leaders

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR HARPER'S WEEKLY

Herbert Henry Asquith, the new Premier of England, was born in 1852. He had a brilliant career at the bar, served as Home Secretary from 1905-10, and was appointed to be Chancellor of the Exchequer in the late Campbell-Bannerman Ministry.

Sir Henry Campbell-Bannerman, who died on April 22, 1917, filled many governmental offices during his long Parliamentary career. He was Secretary for War in the last Liberal administration, became Liberal leader in 1909, and Premier at the end of 1911.

THE "C-B" cabinet was a strong one; the Asquith cabinet is stronger. It is stronger, in the first place, because it is led by a Premier in the full maturity of his very remarkable powers. I have so recently dealt with Mr. Asquith in this journal, and with the contrast he presents to his predecessor, that I need not on this occasion give more than a few words to the subject. The secret of "C-B's" almost phenomenal success as Prime Minister lay not in his intellect or his debating power or strength of will, but solely in personality. He had earned the affection and gratitude of all Liberals by standing manfully to his guns when the tide of battle seemed to have pulled furiously against his party. During the Boer war he showed moral courage of the kind that democracies, sooner or later, are always sure to reward. The man who confronts an overwhelming majority of the nation, tells them squarely that they are acting wrongly, and unflinchingly denounces the policy upon which their hearts are set, is invariably in the end more respected for his integrity than he is blamed for his opinions. That was the case with "C-B," and it established, especially when fortune had played into his hands, an irresistible claim upon the loyalty of his party. In the Premiership "C-B" impressed his position by the exercise of a prudence, energy, and his geniality, his placid, accommodating disposition, his simple sincerity did more to confirm his personal supremacy than the eloquence, energy, and overwhelming authority of a Gladstone could have done. Far more stable in his opinions than Mr. McKinley, much less of a trimmer, his success in holding together the discordant elements of his following was achieved by Mr. McKinley's arts of conciliation and persuasion.

Mr. Asquith is a man of a very different bias. He has little or nothing of "C-B's" lubricating mellowness. With many high and serviceable gifts, he has not that of making himself loved. Admiration, confidence, respect—he has all that. But hitting him, he has failed to elicit those warmer sentiments of personal attraction which give to leadership its true vitality. He is virile, energetic, supremely sure of himself, supremely capable. His brain is an instrument of concentrated efficiency. His political courage has been proved again and again. As a speaker he has no superior in Great Britain in the qualities of precision, readiness, lucidity, and in the command of vigorous, telling phrases. But men complain that he is too self-centred, too aloof, too bloodless, too metallic. They say that he is not without a spice of intellectual arrogance, that it is difficult for him to make the necessary allowances for that kind of honest stupidity of which England is so rich, and that the factor of his personality does not work out in an easy equation. There is some truth in this. But on the other hand it has always to be remembered that no man is the same as Prince and as King, as a subordinate minister and as head of the cabinet. The elevation to the highest office of all brings with it an enormous change of interests, opportunities, and point of view. Mr. Asquith has always hitherto contrived to rise to the heights of whatever post he might be filling, and I for one do not question that as Premier he will succeed in cultivating the smaller arts of ingratiation in which up till now he has hardly made an effort to excel. Meantime it means much for his party that it should have as its leader a man of his unimpaired driving power. Carlyle declared the result of the Franco-Prussian war to be that Europe had exchanged a mistress for a master. Something of the same sort has happened to the Liberals; and both the party and the country will, I think, secretly welcome the touch of a firm hand on the reins and the sense of purpose, tenacity, and direction in the back-seat.

In the next place, the new cabinet is stronger because on all questions of foreign policy the Prime Minister and the Foreign Secretary are now at one. So far as the latter's department of affairs is concerned, the cabinet is a Rosebery cabinet without Lord Rosebery. It would be hard to conceive two men in closer political agreement than Mr. Asquith and Sir Edward Grey. Both belong to the same school of political thought and to the same order of political temperament. Both are pledged to uphold the continuity of foreign policy. In the last cabinet it not infrequently

happened that the Premier and the Foreign Secretary spoke with two voices. "C-B" subscribed to the sentimental view of foreign affairs, and rarely ventured on questions connected with them without commiserating his country. His handling of the Hague conference and of the limitation of armaments, for instance, was altogether opposed to the general sense of the country. Notably in England though it was Sir Edward Grey's doing, or that he really approved of it. It was universally recognized as a stroke of "C-B's" own lot; and the awkwardness of the Prime Minister having one policy and his Foreign Secretary another was widely commented on. Nothing of the kind is likely to happen while the present cabinet remains in office. The agreement between Mr. Asquith and Sir Edward Grey on the first principles, aims, and methods of British foreign policy is complete, and the nation must necessarily gain by it.

Again the new cabinet is stronger because it has got rid of some of the less satisfactory members of the old. Lord Kitchener leaves the Colonial Office after ruling an untamed Empire in the manner of the "heavy horse" of stage tradition. Dull, slow, and unresponsive, he resembled that professor whom Lord Rosebery has excelled as "one of those strange children of our political system who contrive to fill the most dazzling offices with the most complete obscurity." Lord Kitchey typed the kind of ultra-British personality that could never be allowed into the Colonial Office—the kind of personality from which it was hoped that Mr. Chamberlain had forever rescued the governance of the Empire. Lord Tweedmouth, again, is transferred from the Admiralty at \$25,000 a year to the dignified seclusion of the Lord Presidency of the Council at \$10,000 a year. A delightful personality, he has no ground a great success as an administrator, and the affair of the Kaiser's letter attached a certain ridicule to him.

Lastly, the new cabinet is stronger by the inclusion of some new members and the promotion of some of the older ones. Mr. Lloyd-George, after giving Raglanism an entirely new conception of the Board of Trade, is raised to the Chancellorship of the Exchequer, the second post in the government, within thirty months of his first admission to ministerial rank. The appointment is one that men of all parties, and particularly men of business, who are usually of no party, are at one in regarding as brilliantly earned. His hard-headedness and practicality, his glowing nature, and the irresistible charm, buoyancy, and frankness of his manner, the singularity of his appeal both to the world of commerce and that of sentiment, and his real elevating genius must make him in future one of the commanding personalities in English politics. Mr. Winston Churchill, who succeeds him at the Board of Trade and as a writer, engaged in a terrible struggle for his seat in Manchester, needs no introduction to Americans. It is a very long while since a more brilliantly equipped young man has entered English public life. Only perverseness and partisanship would deny his splendid talents; only the exaggeration of friendship would hold that his manner and character stand in no need of improvement. He is the only man in the country who could have succeeded Mr. Lloyd-George at the Board of Trade without creating an impression of anti-climax. For my part I do not doubt that he will continue and even improve upon the Lloyd-George tradition.

Lord Crewe, who goes to the Colonial Office, is the son of Mordaunt Milnes, and came in for Lord Rosebery. He is in his fifth year. Sixteen years ago he served for a while as Lord Lonsdale's tenant of Ireland, but it was not until 1900, when the whole brunt of defending Mr. Russell's education bill in the House of Lords fell upon him, that his Parliamentary gifts became recognized in full. A poet of some distinction, the friend of Tennyson and Browning, and always fond of associating with literary men, Lord Crewe developed during the education debates a very real talent for dealing with affairs. His humor, common sense, acuity, and literary flavor make him one of the pleasantest of speakers and a first-rate diplomatist. Another appointment that has aroused a great deal of interest, although mingled with some doubt, is that of Mr. McKinnon to the Admiralty. Mr. McKinnon is forty-five years old, and possesses a remarkable head for finance. He is a close friend of Mr. Asquith, and showed more strength than caution or judgment in taking charge of the education bill which he introduced a few weeks ago.

HOW PENNSYLVANIA'S STATE CONSTABULARY PUT DOWN A STRIKE

MEMBERS OF THE STATE CONSTABULARY ESCORTING A CAR THROUGH THE STREETS OF CHESTER. EMPLOYEES OF THE TRACTION COMPANY ARE REMOVING SPEKES PLACED IN THE TRACKS BY THE STRIKERS TO PREVENT THE MOVEMENT OF CARS.

A CONSTABULARY TROOPER ON PATROL DUTY. AT THE HEIGHT OF THE TROUBLE MORE THAN 2000 STRIKERS AND SYMPATHIZERS SWARMED THROUGH THE STREETS OF THE CITY, AND THE TROOPERS WERE CALLED UPON FOR PHYSICAL COURAGE AND DISCRETION.

DESPITE a threat on the part of the striking street-railway employees of Chester, Pennsylvania, that a mob of 2000 would give battle to any armed force called out to quell them, a force of the State constabulary was ordered by Governor Stuart to take charge of the streets of the city. The efficiency of the constabulary was demonstrated by the fact that disorder was effectually sup-

pressed and the business of the traction company gradually resumed. Shots were exchanged in some instances, and some injuries were reported. The State police were shot at from ambush and were made a target for stones, bricks, and other missiles thrown from concealed positions; but the resistance of the strikers resolved itself in the end to a struggling host-ile of eggs.

STRENGTHENING OUR FORCES IN THE EAST—A SHIPMENT OF SUBMARINES FOR MANILA

New York's Own College, and its New Home

Copyright 1912 by B. P. McMurry
President John H. Finley, of the
College of the City of New York

THE northward movement of Manhattan, whose business quarter is encroaching yearly upon the residential sections, has driven up-town many old educational institutions. The last to yield its long-established quarters to the movement is the College of the City of New York, which, after an existence of sixty years at the corner of Twenty-third Street and Lexington Avenue, has now established itself among the cluster of public institutions upon the heights of Harlem.

The College of the City of New York has been associated with the history of Manhattan since 1847, when it was chartered under the title of The Free Academy by the Board of Education. "It has long been a source of regret to many citizens entertaining a lively interest in the cause of public education," read the report drawn up, "that there exists in our city no institution of a higher grade for the gratuitous instruction of those people who have completed their primary education in our common schools."

From 1847 until the year 1866 the affairs of the Free Academy were under the management of an annually appointed Executive Committee of the Board of Education. By the Act of 1866 the board ceased to be the governing body, but its members remained trustees. In 1900 an Act of the Legislature made a further change in the government of the institution by creating a new Board of Trustees, composed of nine members, appointed by the Mayor of the city, as well as the president of the Board of Education, who is, ex officio, an additional member. The appointed members serve for nine years each.

Prior to the year 1882 one year's attendance at the public schools of the city had been made a requisite for admission; but since then the College has been open to all young men of the city of proper age and sufficient qualifications. Graduates of city high schools are admitted on their diplomas.

It was as much the increasing number of applicants as the encroachments of the business section that drove the College from Twenty-third Street to Harlem. Ten years ago the city procured as a site for the new buildings four blocks upon St. Nicholas Heights, extending from One-Hundred-and-Thirty-eighth Street to One-Hundred-and-Fortieth Street, and between St. Nicholas Terrace and Amsterdam Avenue. In 1883 five new buildings were begun here: the Main Building, which contains the administrative offices, assembly hall, lecture and recitation rooms, and laboratories; the Chemistry Building; the Mechanic Arts Building; the Academic Building, known as the Townsend Harris Hall, in commemoration of the chief member of the Board of Education instrumental in securing the old Free Academy; and the Gymnasium. These will be dedicated to their permanent uses on the 14th of May.

The 2000 students at the College are divided into two sections, the larger of which, numbering 1700, consists of pupils in the preparatory department. These will be taught in the Townsend Harris Hall, and the old College Building on Twenty-third Street will be maintained as an annex for this purpose. In the College proper are offered three courses, each four years in length, leading to the degree A.B., and three of the same length to the degree B.S.

The new group of buildings, seen from Amsterdam Avenue, presents a striking appearance, dominating by its position, architecture, and color effects the clusters of institutions between the Cathedral and Morris High School that crown the bluffs overlooking the Harlem plain.

The observer, coming upon the College suddenly as he ascends the slope, is almost startled by the violent contrast between the rugged, dark stone of the walls and the white terra-cotta framing material that crowns each edifice and wall. It accentuates the bold and impressive sharpness of outline, and appears almost inharmonious. But the College has been built for the future, and this apparent contrast and crudeness was effected deliberately. With age there will come a general softening of tones, such an effort has, indeed, already been noted since the first stones were laid.

The Main Building contains class rooms for all the departments appertaining to a pure academic course, the offices of the institution, quarters for the faculty (which numbers more than 200), the library, and the great assembly hall. There are four large lecture rooms, two in each wing of the building, capable of containing two hundred students apiece. Immediately above the locker room on the first story of the central portion of the Main Building is a spacious colonnaded hall, in the front of which stands the group of offices occupied by President Finley. On either side of the library entrance stairways lead up to the magnificent assembly hall, which is to be utilized, in addition to the collegiate requirements, for the city's entertainment of visitors of distinction upon occasion. An impressive picture by Edwin H. Blashfield, illustrative of Wisdom, hangs above the platform.

The Gymnasium, presided over by Dr. Thomas A. Storey, is one of the finest and most complete in this country. Beneath the gymnasium is a swimming-pool of one hundred feet by twenty-nine. From Dr. Storey's point of view the chief centre of interest in this building is the little examination room, with its glass table, whitewashed walls, and clean odor of antiseptics. Every student will pass a doctor's examination on entering the College, and records will be filed and recommendations made.

Very complete shops and laboratories have been installed in the Mechanic Arts Building, which contains also the power plant. There is a large assembly hall in the Townsend Harris Hall for the preparatory division. Subways and pipe galleries interconnect all the buildings.

On Dedication day ceremonies will be performed in connection with the naming of the College gates. There are four of these, crowned with arches—three triple and a single one. They will be named the Hamilton, Washington, Amsterdam, and St. Nicholas gates, from the theosophies or places of historic interest that they confront.

The opening of the College's new home marks fittingly Mr. Finley's fifth year as its president—a period during which his wisdom, foresight, and skill as an educator and administrator have brought the institution to its present position of influence and usefulness.

The new Home of the College of the City of New York, on St. Nicholas Heights

A Spirit in Prison*

A Novel

By Robert Michens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHEEP," ETC.

CHAPTER XIV

WHEN, the next day, Artès sat down at his table to work he found it impossible to concentrate his mind. The irritation of the previous evening had passed away. He attributed it to the physical effect made upon him by the disturbed atmosphere. Now the sun shone, the sky was clear, the sea calm. He had just come out of an ice-cold bath, had taken his coffee, and smoked one cigarette. A quiet morning lay before him. Quies?

He got up and went to the window. On the wooden roof of the bath establishment opposite rows of towels, hung out to dry, were waving lazily to and fro in the soft breeze. Capri was almost hidden by haze in the distance. In the sea, just below him, several heads of swimmers moved. The bay was "making death." He doated on his back, with his eyes closed and his arms extended. His body, giving itself without resistance to every movement of the water, looked corporeal and ghostly.

A companion shouted to him. He threw up his arms suddenly and shouted a reply in the broadest Neapolitan, then began to swim vigorously towards the diving rocks at the base of Castel dell' Uovo. Upon the wooden terrace of the baths among green plants in pots stood three women, probably friends of the proprietor. For though it was already hot the regular bathing season of Naples had not yet begun and the baths were not completed. Only in July, after the feast of the Madonna del Carmine, do the Neapolitans give themselves heart and soul to the sea. Artès knew this and wondered idly what the women were doing on the terrace. One had a dog. It sat in the sun and began to cough. A long wagon on two wheels went by, drawn by two mules and a thin horse harnessed abreast. It was full of white stone. The driver had brought some green stuff and hung it down over the white. He wore a handkerchief on his head. His chest was bare. As he passed beneath the window he sang a loud song that sounded Eastern, such a song as the Spanish gypsies sing in Algeria, as they set out by night on their long journeys towards the desert. Upon a tlay platform of wood, instead to slanting slates which met together beneath it is a tripod, a stout man in shirt and trousers, with black whiskers, was sitting on a chair fishing with a red and blue. A boy sat beside him dangling his legs over the water. At a little distance a large fishing-smack, with sails set to catch the breeze farther out in the bay, was being laboriously towed towards the open sea by half-knaked men, who shouted as they tugged at the immense oars.

Artès wondered where they were going. Their skins were a rich orange color. From a distance in the sunlight they looked like men of gold. Their cries and their fierce movements suggested some fantastic quest to lands of mysterious tumult.

Artès wished that Yve could see them.

What were the inhabitants of the island doing?

Today his mind was beyond his governance, and roamed like a vagrant on a long white road. Everything that he saw below him in the calm radiance of the morning pushed it from thought to thought. Yet none of these thoughts were valuable. None seemed fully formed. They resembled buds, things one so far away that one cannot tell what they are, but is only aware that they exist and can attract attention.

He came out upon his balcony. As he did so he looked down into the road, and saw a hired carriage drive up, with Hermione in it. She glanced up and saw him.

"May I come in for a minute?"

He nodded, smiling, and went out to meet her, glad of this interruption.

They met at the door of the lift. As Hermione stepped out she cast a rather anxious glance at her friend, a glance that seemed to say that she was not quite certain of her welcome. Artès's eyes reassured her.

"I feel guilty," she said.

"Why?"

"I'm coming at such an hour. Are you working?"

"No. I don't know why, but I am incapable of work. I feel both lazy and nervous, an unusual combination. Perhaps something in me is secretly longing for your coming."

"Then it is my fault."

They came into his sitting-room. It had four windows, two facing the sea, two looking on the road, and the terraces and garden of the Hotel Hassler. The room scarcely suggested its present occupant. It contained a light yellow carpet with pink

flowers strewn over it, red and gold chairs, mirrors, a white marble mantelpiece, a gray and pink sofa with a pink cushion. Only the large writing table, covered with manuscripts, letters, and photographs in frames, added something individual to the visitor. Hermione and Yve were among the photographs.

Hermione sat down on the sofa.

"I have come to consult you about something. Emile,"

"What is it?"

"I really meant to ask you last night, but somehow I couldn't."

"Why?"

"I don't know. We—I—there seemed to be a sort of barrier

between us—didn't there?"

"I was in a bad humor. I was tired after the journey, and

perhaps the weather upset me."

"It's all right—one can't be always— Well, this is what I wanted to say. I alluded to it yesterday when I told you about my visit to Naples with Madame Alliani. Do you remember?"

"Yes, indeed you had seen, or heard of, some tragedy."

"Yes. I believe it is a quite ordinary one in Naples. We went

to visit a consumptive woman in one of those narrow streets going up hill to the left of the Via Roma, and while there by chance I heard of it. In the same house as the sick woman there is a girl. Not many days ago she was beautiful."

"Yes? What has happened to her?"

"I'll tell you. Her name is Peppina. She is only nineteen, but she has been one of those who are not given a chance. She was left an orphan very young and went to live with an aunt. This aunt is a horrible old woman. I believe—they say she goes to the gallies—"

Hermione paused.

"I understand," said Artès.

"She is greedy, vicious, merciless. We had the story from the woman we were visiting, a neighbor. This aunt forced Peppina into sin. Her beauty, which must have been extraordinary, naturally attracted attention and turned people's heads. It seems to have driven one man almost mad. He is a fisherman, not young, and a married man. It seems that he is notoriously violent and jealous, and thoroughly unscrupulous. He is a member of the Camorra, too. He gostered Peppina with his attentions, coming day after day from Megellina, where he lives with his wife. One night he entered the house and made a scene. Peppina refused finally to receive his advances, and told him she hated him before all the neighbors. He took out a razor and—"

Hermione stopped.

"I understand," said Artès. "He disfigured her."

"Dreadfully."

"It is often done here. Sometimes a youth does it simply to

show that a girl is his property. But what is it you wish to do

for Peppina? I see you have a plan in your head."

"I want to have her on the island."

"In what capacity?"

"As a servant. She can work. She is not a bad girl. She has only—well, Emile, the aunt only succeeded in fixing one horror on her. That is the truth. He was rich and bribed the mind. But of course the neighbors all know, and the population here has its virtues, but it is not exactly a delicate population."

"Per Hecce?"

"And now that the poor girl is disfigured the aunt is going to turn her out of doors. She says Peppina must go and earn money for herself. Of course nobody will take her. I want to, I have seen her, talked to her. She would be so thankful. She is in despair. Think of it! Nineteen, and all her beauty gone! Isn't it terrible?"

"And the man?"

"Oh, they say he'll get severely anything if anything. Two or three months, perhaps. He is 'protected.' It makes my blood boil."

Artès was silent, waiting for her to say more, to ask questions.

"The only thing is—Yve, Emile," she said.

"Yve?"

"Yes. You know how friendly she is with the servants. I like her to be. But of course till now they have been all right—so far as I know."

"You do well to add that proviso."

"Peppina would not touch on me. She would be in the kitchen. As I justified in taking her? Of course I could help her with money. If I had not seen her, talked to her, that is what I should have done, no doubt. But she wants—she wants everything, peace, a decent home, pure air. I feel she wants the island."

"And the other servants?"

"They need not know she was attacked. They need not know

her past history. But all that does not matter. It is only the question of Vere that troubles me."

"You mean that you are not decided whether you ought to bring into the house with Vere a girl who is not as Vere is?"

"Yes."

"And you want me to advise you?"

"Yes."

"I can't do that, Hermione."

She looked at him almost as if she were startled.

"Why not? I always rely—"

"No, no. This is not a man's business, my business."

He spoke with an odd hesitancy, and there were traces of agitation in his face. Hermione did not at all understand what feeling was prompting him, but again, as on the previous evening, she felt as if there were a barrier between them; very slight, perhaps, very shadowy, but definite, nevertheless. There was no longer complete frankness in their relations. At moments her friend seemed to be subtly dominated by some secret irritation, or anxiety, which she did not comprehend. She had been aware of it yesterday. She was aware of it now. After his last exclamation she said nothing.

"You are going to this girl now?" he asked.

"I mean to, yes. I shall go."

She sat still for a minute, looking down at the pink and yellow carpet.

"And what will you do?"

She looked up at him.

"I think I shall take her to the island. I am almost sure I shall. Emily, I don't believe in conversion, and I sometimes think I am inclined to be a coward about Vere. She is growing up. She will be seventeen this year, very soon. There are girls who marry at sixteen, even English girls."

"That is true."

She could gather nothing from his tone; and now his face was positively calm.

"My instinct is to keep Vere just as she is, to preserve the loveliness of childhood in her as long as possible, to keep away from her all knowledge of sin, sorrow, the things that distract and torture the world. But I mustn't be selfish about Vere. I mustn't keep her wrapped in cotton wool. That is somehow wrong. And, after all, Vere must have her life apart from me. Last night I realized that strongly."

"Last night?"

"Yes, from the way in which she treated the Marchese, and later on something else. Last night Vere showed two sides of a woman's nature—the capacity to hold her own, what is vulgarly called 'to keep her distance,' and the capacity to be motherly."

"Was Vere motherly to the Marchese, then?" asked Artois, not without irony.

"No—to Ruffo."

"That her? But where was he last night?"

"When we got back to the island, and the launch had gone off, Vere and I stood for a minute at the foot of the steps to listen to the roaring of the sea. Vere loves the sea."

"I know that."

As he spoke he thought of something that Hermione did not know.

"The Poel was protected, and under the lee of the island it was comparatively calm. But the rain was falling in torrents. There was one fishing boat in the Poel, close to where we were, and as we were standing and listening Vere said, suddenly, 'Madre, that's Ruffo's boat.' I asked her how she knew—because he has changed into another boat lately—she had told me that. 'I saw his head,' she answered. 'He's there and he's not asleep. Poor boy, is all this rain?' Ruffo has been ill with fever, as I told you, and when Vere said that, I remembered it at once."

"Had you told Vere yet?" interposed Artois.

"No. But I did then. Emily also showed an agitation that—well, it was almost strange, I think. She begged me to make him come into the house and spend the night there, safe from the wind and the rain."

"And you did, of course?"

"Yes. He was looking very pale and shaky. The men let him come. They were nice and sympathetic. I think they are fond of the boy."

"Ruffo seems to know how to attract people to him."

"Yes."

"And so Vere played the mother to Ruffo?"

"Yes. I never saw the side of her before. She was a woman then. Eventually Ruffo slept with Gaspare."

"And how did Gaspare accept the situation?"

"Better than I should have expected. I think he likes Ruffo personally, though he is inclined to be suspicious and jealous of any strangers who come into our lives. But I haven't had time to talk to him since he arrived."

"Is Ruffo still in the house?"

"Oh no. He went off in the boat. They came for him about eight."

"Ah!"

Artois went to the window and looked out. But now he saw nothing, although the three women were still talking and gossiping on the terrace of the bath-house, none disconcerted by being heard or moved out into the bay, carts were passing by, and people were strolling in the sun.

"You say that Vere showed agitation last night?" he said, turning round after a moment.

"About Ruffo's illness? It really almost amounted to that. But Vere was certainly excited. Didn't you notice it?"

"I think she was."

"Emile," Hermione said, after an instant of hesitation, "you

remember my saying to you the other day that Vere was not a stranger to me?"

"Yes, quite well."

"You said nothing—I don't think you agreed. Well, since that day—only since then—I have sometimes felt that there is much in Vere that I do not understand, much that is hidden from me, that she changed lately?"

"She is at an age when development seems sudden, and is often striking, even startling."

"I don't know why, but—but I dread something," Hermione said.

"I feel as if—no, I don't know what I feel. But if Vere should ever drift away from me I don't know how I could bear it. A boy—some experts like to go into the world. But a girl? I want to keep Vere. I must keep Vere. If anything else were to be taken from me I don't think I could bear it."

"Vere loves you. Be sure of that."

"Yes."

"Hermione put up."

"Well, you won't give me your advice?"

"No, Hermione."

He looked at her steadily.

"You must trust Vere as you think best, order her life as you think right. In most things you do well to consult me. But in this you must rely on yourself. Let your heart teach you. Do not ask questions of my head."

"Your head?" she exclaimed.

There was a trace of disappointment, even of surprise, in her voice. She looked at him as if she were going to say more, but again she was dissuaded by something in his look, his attitude.

"Well, good-by, Emile."

"I will come with you to the lift."

He went with her and touched the electric bell. As they waited for a moment he added:

"I should like to have an evening quietly on the island."

"Come to-night, whenever you like. Don't fit me. Come when the inclination whispers—I want to be with friends."

He pressed her hand.

"Shall I see Peppina?"

"That is to say?"

"And how is she?"

She laughed.

"The Marchese, too, perhaps?"

"No," said Artois, emphatically. "Disfigured girls and fisher-boys—as many as you like, but not the alta aristocrazia Napoletana."

"But I thought—"

"I like Doro, but—I like him in his place."

"And his place?"

"Is not the island—when I wish to be quiet there."

The lift came and she descended. Artois went out once more on to the balcony, and watched her get into the carriage and drive away towards Naples. She did not look up again.

"She has gone to fetch that girl, Peppina," Artois said to himself. "And I ought have prevented it."

He knew very well the reason why he had not interfered. He had not interfered because he had wished too much to interfere. The desire had been strong enough to startle him, to warn him.

An idiot! That suggests isolation. Like Hermione he wished to isolate Vere, to preserve her as she was in character. He did not know when the wish had first been consciously in his mind, but he knew that since he had been consulted by Vere, since she had broken through her reserve and submitted to him her pains, unwilling for him alone what was really for her a holy of holies, the wish had enormously increased. He told himself that Vere was unique, and that he longed to keep her unique, so that the talent he discerned in her might remain unimpaired. How great her talent was he did not know. He would not know, perhaps, for a very long time. But it was definite, it was intimate. It was Vere's talent, no one else's.

He had made up his mind very soon about Hermione's incapacity to produce work of value. Although Vere was such a child, so inexperienced, so innocent, so clustered, he knew at once that he dared not dash her hopes. It was possible that she might eventually do what he himself could not do.

But she must not be interfered with. Her coming into the sea must not be severed. And people were coming into her life: Ruffo, the Marchese, and now this wounded girl, Peppina.

Artois felt uneasy. He wished Hermione were less generous-hearted, less impulsive. She looked on him as a guide, a check. He knew that. But this time he would not exercise his prerogative. Ruffo did not need—at least he thought he did not. The boy was a sea creature. He might even be an inspiring force to Vere. Something Artois had read had taught him that. And Ruffo interested him, attracted him too.

But he hated Vere's acquaintance with the Marchese. He knew that the Marchese would make love to her. And the knowledge was odious to him. Let Vere be loved by the sea, but by no man as yet.

And this girl, Peppina?

He thought of the horrors of Naples, of the things that happen "behind the shutter" of the lives led by some men and women, some boys and girls of the great city beneath the watching volcanoes. He thought of evenings he had spent in the Galleria. He saw before him an old woman about whom he had often wondered. Always at night, and often in the afternoon, she walked in the Galleria. She was anxiously alone. The first time he had seen her he had noticed her because she had a slightly humped back. Her hair was snow white, and was drawn away from her long pale face and carefully arranged under a modest bonnet. She carried a small umbrella and a tiny bag, glancing at her ear-

usually, he had supposed her to be a respectable widow of the bourgeois class. But then he had seen her again and again, and by degrees he had come to believe that she was something very different. And then one night in late spring he had seen her in a new light dress, with white trailing gloves. And she had noticed him watching her, and had cast upon him a look that was unmistakable, a look from the world "behind the shutter," and he had understood. Then she had followed him persistently. When he sat before the "Gran Caffè" sipping his coffee and listening to the orchestra of women that plays on the platform outside the caffè, she had passed and re-passed, always casting upon him that glance of sinister understanding, of invitation, of diavly wickedness that sought for and believed that it had found, an answering wickedness in him.

Terrible old woman! Peppina's aunt might well be like that. And Peppina would sleep, perhaps to-night, in the Casa del Mare, under the same roof as Verè.

He resolved to go that evening to the island, to see Peppina, to see Verè. He wished, too, to have a little talk with Gaspare about Raffa.

The watching rancor, which dwelt also in Gaspare, was alive in him.

But to-day it was alive to do service for Verè, not for Hermione. He knew that, and said to himself that it was natural. For Hermione was a woman, with experience of life; but Verè was only upon the threshold of the world. She needed protection more than Hermione.

Some time ago, when he was returning to Naples from the island on an evening of sunset, Artos had in thought transferred certain hopes of his from Hermione to Verè. He had said to himself that he must henceforth hope for Hermione in Verè.

Now was he not transferring something else from the mother to the child?

CHAPTER XV

Artos had intended to go that evening to the island. But he did not fulfil his intention. When the sun began to sink he threw a light coat over his arm and walked down to the harbor of Santa Lucia. A boatman whom he knew met him and said:

"Signal I take you to the island, signore?"

Artos was there to take a boat. He meant to say yes. Yet when the man spoke he answered no. The fellow turned away and found another customer. Ten or three minutes later Artos saw his boat drawing out to sea in the direction of Posillipo. It was a still evening, and very clear after the storm of the preceding night. Artos longed to be in that travelling boat, longed to see the night come from the summit of the island with Her- mione and Verè. But he resisted the sea, its wide peace, its subtle summons, called a carriage and drove to the Galleria. Arrived there, he took his seat at a little table outside the "Gran Caffè," ordered a small dinner, and while he was eating it, watched the people striding up and down, seeking among them for a figure that he knew.

As the hour drew near for the music to begin, and the girls dressed in white came out one by one to the platform that, surrounded by a white railing edged with red velvet, is built out beyond the caffè to face the crowd, the summer of promenaders in respect, and many stood still waiting for the first note and debating the looks of the players. Others thronged around Artos, taking possession of the many little tables, and calling for beer, lemon-water, syrups, and liqueurs. Priests, soldiers, sailors, students, actors—who assemble in the Galleria to seek engagements—new-boys, and venetians, whose faces suggested that they were "ruffians," mingled with foreigners who had come from the hotels and from the ships in the harbor, and whose demeanor was partly cautious and partly suspicious, as if one who longs to probe the psychology of a thief while safely guarding his pockets. The buzz of voices, the tramp of feet, joined a peculiar and vivid consciousness from the high and vaulted roof; red in the warm air, under the large and winking electric lights, the perpetually moving figures looked strangely capricious, hungry, determined, furtive, ardent, and misent. On their little stands the electric fans

whirled as they slowly revolved, casting an artificial breeze upon the pallid faces, and around the central dome the angels with gilded wings lifted their right arms as if pointing the unconscious multitude the difficult way to heaven.

A priest sat down with two companions at the table next to Artos. He had a red cord round his shaggy black hat. His face was like a prospect's, with small lively eyes full of an intellectual sharpness. His plump body suggested this world, and his whole demeanor, the movements of his dimpled, dirty hands, and of his protruding lips, the attitude of his extended legs, the pose of his coarse shoulders, seemed hostile to things mystical. He snatched an eye, and swallowed a body composed of food and water, talking the while with a sort of gluttonous vivacity. Artos looked at him and heard, with his imagination, the sound of the bell at the elevation, and saw the bowed heads of the crouching worshippers. The irony of life, that in the deepest mystery of life, came upon him like the wave of some pain sea. He looked up at the gilded angels, then dropped his eyes and saw what he had come to see.

Slowly threading her way through the increasing throng came the old woman whom he had watched so often and by whom he had been watched. To-night she had on her summer dress, a respectable, rather dingy gown of grayish mauve, a bonnet edged with white ribbon, a pair of white trailing gloves. She carried her little bag and a small Japanese fan. Walking in a strange, but-footed way that was peculiar to her, and glancing narrowly about her, yet keeping her head almost still, she advanced towards the band stand. As she came opposite to Artos the orchestra of women struck up the "Valse Noir," and the old woman stood still, impeded by the too dense crowd of listeners. While the demurely sinister music ran its course she remained absolutely immobile. Artos watched her with a keen interest.

It had come into his mind that she was the aunt of Peppina, the disgraced girl, who perhaps to-night was sleeping in the Casa del Mare with Verè.

Presently, attracted, no doubt, by his gaze, the old woman looked across at Artos and met his eyes. Instantly a sour and malignant expression came into her long pale face, and she drew up a corner of her upper lip, as a dog sometimes does, showing a tooth that was like a menace.

She was secretly cursing Artos.

He knew why. Enraptured by his former observation of her, she had scented a client in him and had been deceived, and this deception had bred within her an avowed hatred of him. To-night he would chase away that hatred. For he meant to speak to her. The old woman looked away from him, holding her head down as if in cold disdain. Artos rose, and she was passing in her mind. She believed him wicked, but nervous in his wickedness, desirous of her services but afraid to invite them. And she held him in the uttermost contempt. Well, to-night he would undeceive her. He kept his eyes upon her so firmly that she looked at him again. This time he made a sign of recognition, of understanding. She stared as if in suspicious amazement. He glanced towards the door, then at her once more. At this moment the waiter came up. Artos paid his bill slowly and ostentatiously. As he continued to sit the money upon the little tray he looked up once, and saw the eyes in the long, pale face of the venerable temptress glitter while they watched. The music ceased, the crowd before the platform broke up and began quickly to melt away. Only the woman waited, holding her little bag and her cheap Japanese fan.

Artos drew out a cigar, lit it slowly, then got up and began to move out among the tables. The priest looked after him, spoke rapidly to his companions, and burst into a throaty laugh which was loudly echoed. "Mamma Fortunata is in luck to-night!" said some one. Then the band began again, the waiter came with more beer, and the tall, haggard-looking temptress was forgotten. Without glancing at the woman Artos strolled slowly on. Many people looked at him, but none spoke to him, for he was known now, as each stranger who stays long in Naples is known,

The old woman's face became terrible

summed up, labelled, and either ignored or perverted. The souls and the ruffian were aware that it was no use to preter the Frenchman, and even the decept and indeliberately seedy old men who hover before the huge plate-glass windows of the photograph shops, or linger near the entrance to the cinematograph, never peeped at him out of the corners of their bloodshot eyes, or whispered a word of the white slaves in his ear.

When he was beneath the dome, and could see the light gleaming upon the wings of the painting angels, Artola seemed to be aware of an individual step among the many feet behind him, a step soft, fertile, and obstinate, that followed him like a fate. He glanced up at the angels. A seawind and half-butter smile came to his lips. Then he turned to the right and made his way, still slowly, towards the Via Roma, always crowded from the early afternoon until late in the night. As he went, as he pushed through the mob of standing men at the entrance of the Galleria, and crossed the street to the far side, from which innumerable narrow and evil-looking alleys stretch away into the darkness up the hill, the influence of the following old woman increased upon him, eating upon him like a roast her hateful eagerness. He desired to be rid of it, and, quickening his walk, he turned into the first alley he came to, walked a little way up it, until he was in comparative solitude and obscurity, then stopped and shrilly tutted.

The shiny grayish mauve gown and the white-trimmed bonnet were close to him. Between them he faintly perceived a widely smiling face, and from this face looks at once a sickly torrent of speech, half Neapolitan dialect, half bastard French.

"Signorini!" Artola said, slowly.

The old harpion stopped in surprise, showing her teeth.

"What has become of Peppina?"

"Maria Santissima!" she ejaculated, moving back a step to the darkness.

She paused. Then she said:

"You know Peppina?"

She came forward again, quite up to him, and peered into his face, seeking there for an ugly truth which till now had been hidden from her.

"What had you to do with Peppina?"

"Nothing. Tell about her and—"

He put his hand to the inside pocket of his coat and showed her the edge of a little case containing paper notes. The woman misinterpreted him. He knew that by her face, which for the moment was as a battlefield on which had fought with a desperate anger of disappointment. Then coming came to stop the battle.

"You have heard of Peppina, signorini? You have never seen her?"

Artola played with her for a moment.

"Never."

Her smile widened. She put up her thin hands to her hair, her hands, courtly.

"There is not a girl in Naples as beautiful as Peppina. Mother of—"

But the pause was too loathsome with such a player.

"Beautiful! Marvino!"

He laughed, made a gesture of pulling out a knife and smashing his face with it.

"Beautiful! Per Dio!"

The exquity, the cunning dropped out of the long, pale face.

"The signorine knows?"

"Ma sì! All Naples knows."

The old woman's face became terrible. Her two hands shook up, dropped, shut up again, imprecating, cursing the world, the sky, the whole scheme of the universe, it seemed. She chattered like an ape. Artola soothed her with a ten-lira note.

That night, when he went back to the hotel, he had heard the aunt's version of Peppina and knew—that which really he had known before—that Hermine had taken her to live on the island. Hermine! What was she? An original, clever and blind, great-hearted and unwise. An enthusiasm, one created to be carried away.

Never would she grow really old, never surely would the primal face within her die down into the gray ashes that litter so many of the beautiful in the city, a black, unquiet shadow.

And Peppina was on the island, a girl from the streets of Naples; not wicked, perhaps, rather wronged, injured by life—nevertheless, the niece of that horror of the Galleria.

He thought of Vere and shuddered.

Next day towards four o'clock the Marchese strode into Artola's room, with a peculiarly impudent look of knowledge upon his face.

"Then signor, caro Emilio," he said. "Are you busy?"

"Not especially."

"Will you come with me for a stroll in the Villa? Will you come to see the gathering together of the guests?"

"The diavolo! What's that?"

"This summer the Marchese Pontini has organized a sort of club, which meets in the Villa every day except Sundays. Three days the meeting is in the morning, three days in the afternoon. The wildest people of the aristocracy belong to this club, and the Marchese is the mother goose. Ezer! Will you come, or—do you have you some appointment?" He smiled in his friend's face. Artola wondered, but could not divine, what was at the back of his mind.

"No, I had thought of going on the sea."

"Or to the Toledo, perhaps."

The Marchese laughed lightly.

"The Toledo? Why should I go there?"

"Not to me, son. Put on your elegant and come. If fruit tries to eat apples—"

But he was very proud of his French, which made Artola secret.

ly shiver, and generally spoke it when he was in specially good spirits or was feeling unusually mischievous. As they walked along the sea front a moment later, he continued in Italian:

"You were not at the island yesterday, Emilio?"

"No. Were you?"

"Naturally called to know how the ladies were after that terrible storm. What else could I do?"

"And how were they?"

"The signorina was in Naples, and, of course, the signorina could not have received me above. But the saints were with me. Emilio, I met her on the sea, quite by herself, on the sea of the Santa Lucia. She was lying back in a little boat, with me but on her hands behind her head—no, and her eyes—her beautiful eyes. Emilio, were full of dreams, of dreams of the sea."

"How do you know that?" said Artola, rather sharply.

"Così?"

"How do you know the signorina was dreaming of the sea?"

Did she—did she tell you?"

"No, but I saw her. We talked together from the boat. I told her she was an enchantress of the sea, the spirit of the wave—I told her."

He spread out his hands, rejoicing in the remembrance of his graceful compliment.

The signorina was delighted, but she could not stay long. She had a slight headache and was a little tired after the storm. But she would have liked to ask me to the house. She was longing to. I could see that."

He stirred his mustache.

"She told me her hand away trying to conceal from me her desire, but—"

He laughed.

"Le donne! Le donne!" he happily exclaimed.

Artola found him wondering why, until there had made the acquaintance of the dwellers on the island, he had never wished to smack his smooth, complacent cheeks.

They turned from the sea into the broad walk of the Villa, and walked towards the kiosks. Near it, on the small green chairs, were some ladies seated in gigantic floating veils, talking to two or three very smart young men, in white suits and straw hats, who leaned forward, crying themselves steadily, with a determined yet rather various boldness that did not discover them. One of the ladies, dressed in black and white check, was immensely stout. She seemed to lead the conversation, which was carried on with extreme civility in very loud and not melodious voices.

"Ecco the gathering of the great," said the Marchese, touching Artola on the arm. "And that"—he pointed to the stout lady, who at this moment tossed her head till her veil swung loose like a sail suddenly deserted by the wind—"is the great mother of the house, Marchesa! Buena sera—mamma piaccio. Carlo, buona sera—a rividevi, Comessa! A queda sera."

He showed his splendid teeth in a broad but winning smile, and, but in hand, went by, walking from his hips. Then, replacing his hat on his head, he added to his friend:

"The Marchesa is always hoping that the Duchess d'Aosta will come one day, if only for a moment, to smile upon the green. But—well, the Duchess prefers to climb to the fourth story to see the port, she has a host. Let us sit here, Emilio."

They sat down under the trees, and the Marchese looked at his pointed boots for a moment in silence, pushing forward his under lip until his blond mustache touched the juncture tip of his nose. Then he began to laugh, still looking before him.

"Emilio! Emilio!"

He shook his head repeatedly.

"Emilio mio! And that you should be asking me to show you Naples! It is too good! I'est parfait!"

The Marchese turned towards Artola.

"And Maria Fortunata! Santa Maria of the Toledo, the whole hilled protectress of the strangers! Emilio, you might have come to me! But you do not find me. Ecco! You do not—"

Artola understood.

"You saw me last night?"

"Ma sì! All Naples saw you. Do you not know that the Galleria is full but full—of eyes?"

"Ca bene! But you don't understand."

"Emilio!"

He shrugged his shoulders, lifted his hands, his eyebrows. His whole being seemed as if it were about to mount ironically to waste heaven.

"You don't understand. I repeat it."

Artola spoke quietly, but there was a sound in his voice which caused his frivolous companion to stare at him with an inquiry that was, for a moment, almost sulky.

"You forget, then, how old I am."

"What has that to do with it?"

"You forget."

Artola was about to allude to his real self, to point out the improbability of a man so unworldly, as known, as travelled as he was, falling like a schoolboy publicly into a sordid adventure. But he stopped, recalling the web-ness of such an explanation. And he could not tell the Marchese the truth of his slender sedition in a by-street with the old creature from behind the shutter.

"You have made a mistake about me," he said. "But it is of no consequence. Look! There is another guest coming."

He pointed with his cane in the direction of the chattering near the kiosks.

"He is here! He is here!"

"Ferdini! I did not recognize."

The Marchese got up.

"Let us go there. The Marchese with papa—It is better than

For an International Jury

A DIPLOMATIC PROBLEM IN WHICH STATECRAFT IS OF LITTLE AVAIL.

Miss —

AWARDED BY A JURY OF ARTISTS THE
TITILE OF THE MOST BEAUTIFUL WOMAN
IN ENGLAND AMONG 15,000 COMPETITRESS

Miss Frey, of Denver

WINNER OF THE AMERICAN COMPETITION FOR THE SUPREMACY IN BEAUTY
Copyright, 1904, by Francis & Taylor and The Century Co.

IN order to afford an opportunity for amicable comparison, the portraits of the most beautiful woman in England and the most beautiful woman in America are shown here side by side. Each of these is remarkably typical of her own country. Miss Marguerite Frey, of Denver, was selected from among numerous competitors by the *Chicago Tribune*, which challenged all countries to produce her peer. This challenge was taken up by the *Daily Mirror*, of London, which appointed a committee of nine prominent artists to decide upon the fairest face in England. After studying and comparing 15,000 portraits, submitted during a period of seven months, the committee delivered their unanimous verdict in favor of the young woman whose portrait is reproduced on this page. The artists who formed the committee were: Sir James Linton, R.I., Miss Maud Porter, Mr. A. Carruthers Gould, R.B.A., Mr. Arthur Hacker, A.R.A., Mr. John Russell, R.I., Mr. Richard Jack, Mr. G. P. Jacob-Flood, R.I., Mr. John Lavery, R.S.A., and Mr. Charles Lewis.

"The photograph of this young Englishwoman is in every way superior, as representing female beauty, to that of the American young lady, Miss Frey," wrote Sir James Linton, R.I. "The latter

is very pretty, but of much smaller character than the English head."

"I consider the photograph of Miss — to be the more beautiful, and, if expressing less character than that of the American girl, it possesses more perfection of form," wrote Mr. Lavery.

"Miss — far surpasses Miss Frey as a refined type of beauty full of simplicity and tranquillity," wrote Mr. A. Carruthers Gould, R.B.A.

"A much finer type of beauty than Miss Frey," wrote Miss Maud Porter, "the features being better proportioned and more beautiful in form."

The name of the champion of British palehairs has been with held from publicity, but she delivered herself of the following remarks to the *Daily Mirror* representative:

"I was born in Yorkshire, and have lived in Lancashire and Scotland. I have never worried a bit about making myself look pretty. Mother is prettier than I am. We use any nice soap that is handy, and we never use anything for our hair."

"I like tea, coffee, and cream, and sometimes drink a little claret. I eat lobster and cucumber."

The Greatest Railroad Station in the World

(See illustration on page 20.)

THE new Pennsylvania Railroad Station in New York, which is to be one of the largest buildings of its kind in the world, is slowly rising out of the gaping depths that extend between Thirty-first and Thirty-third streets and Seventh and Eighth avenues. The vast extent of the excavation, in which gangs have been delving and building night and day during the last three years, gave the spectator a sense of wonder at the gigantic task that was being undertaken. It seemed almost beyond physical powers to complete it. But it is being accomplished. The foundations are laid, and little by little the steel framework of the central building rises above the surrounding houses.

This central portion will be more than half the height of the Platform Building, which rises about 264 feet above the sidewalk. The top of the granite roof will be 153 feet above the street. Beneath it, in the centre of the new station, is the main waiting room, of marble and E-glass travertine, measuring 315 feet by 167, with a western extension of 51 by 62. On the right of this, as one looks

at the picture, is the dining-room, 112 feet by 58, and behind it the Arcade, 50 feet wide, runs through from Seventh Avenue on the axis of Thirty-second Street into the main waiting room, which is entered by a flight of stairs leading down 15 feet below the ground level. There is a lunch room of the same dimensions on the same side. Under the dining-room is the baggage and express office.

In addition in the main waiting-room there are two smaller ones, one for men and one for women, each measuring 160 feet by 35. On the left of the picture is shown the magnificent concourse, 472 feet in length and 124 wide, the finest promenade of its kind, rooled over entirely with steel and glass.

There are twenty-one tracks, with eleven platforms, under the main doors, along which the trains will run straight through to reach the Hudson and East rivers from New Jersey to Long Island. It is expected that when the new station has been completed, in another two years' time, it will be used by one hundred million passengers annually.

H. TOWN. STRANG'S TIME WAS 5 HOURS, 14 MINUTES, 13 1-5 SECONDS. OF THE 21 OTHER CONTENDERS, THE ITALIAN DRIVE, EMANUEL CEDRINO, WON SECOND PLACE WITH A 60 HORSE-POWER FIAT CAR; TIME, 5 HOURS, 21 MINUTES, 5 2-5 SECONDS. A 30-HP HORSE-POWER H. P. STARR'S CAR, DRIVEN BY GUY VANCE, WON THIRD PLACE; TIME, 5 HOURS, 24 MINUTES, 29 2-5 SECONDS. THE FASTEST TIME FOR A SINGLE LAP OF THE 32-MILE COURSE WAS MADE BY CEDRINO, WHO TOOK THE LAST LAP IN 36 MINUTES, 48 3-5 SECONDS.

Music and the Opera

THE OPERA SEASON: A RETROSPECT

By LAWRENCE GILMAN

OW that the tumult and the shouting incident to twenty-four weeks of continuous opera is gradually dying, it may not be inappropriate to collect ourselves for brief meditation upon the actual result of it all. How have we profited, in substantial artistic gain, by the experience?

From the night of November 4, when Mr. Oscar Hammerstein began his second season at the Manhattan with a performance of *La Gioconda*, until the night of April 18, when Mr. Heinrich Conried closed his fifth and final season at the Metropolitan, New York has listened to 243 representations of opera, embracing performances of forty-five different works. Of these totals, 111 representations are to be credited to the twenty-one weeks season at the Metropolitan, 127 representations to the twenty-two weeks season at the Metropolitan. Assembled below are the forty-five different operas performed during the season. The first fifteen (grouped in the next paragraph) were given only at the Manhattan; the twenty-two grouped in the second paragraph were given only at the Metropolitan; the eight named in the third paragraph were given at both houses:

Pachelbel's La Gioconda; *Blanc's Carmen*; *Berlioz's Damnation de Faust*; *Ottobach's Les Contes d'Hoffmann*; *Moscow's Thais* and *La Navarraise*; *Veddy's Ernani* and *Le Ballo in Maschera*; *Mascagni's Cavalleria Rusticana*; *Charpentier's Louise*; *Giordano's Fedora* and *Andrea Chénier*; *Debussy's Pelléas et Mélisande*; *Mythen's Die Walküre*; *the Rivié brothers' Crispino e la Comare*.

Meyerbeer's Dinorah; *Puccini's La Bohème*, *Madame Butterfly*, *Tosca*, and *Manon Lescaut*; *Rossini's Barbieri di Siviglia*; *Wagner's Tristan und Isolde*, *Die Meistersinger*, *Flying Dutchman*, *Tannhäuser*, *Die Walküre*, *Die Valkyrie*, *Lohengrin*, *Tristan und Isolde*, *Die Meistersinger*; *Mascagni's Iris*; *Bumperdick's Bonni and Beedee*; *Thomas' Mignon*; *Giordano's Fedora*; *Florenz's Maria*; *Reinhart's Fedora*; *Cilea's Adriana Lecocquer*.

Veddy's Il Trovatore, *Ada, Angiolina*, *La Traviata*; *Donizetti's L'aria di L'assommoir*; *Gossett's Faust*; *Loeschke's I Pagliacci*; *Musart's Don Giovanni*.

Mr. Hammerstein had announced that he would produce eight operas new to America. These were to be *Moscow's Thais* and *Joseph de Nôtre Dame*, *Charpentier's Louise*, *Debussy's Pelléas et Mélisande*, *Giordano's Fedora*, *Mythen's Dinorah*, and *Saint-Saëns' Brites*. Four of these were given: *Thais*, *Louise*, *Pelléas et Mélisande*, and *Ribera*. Mr. Conried had promised a work new to America: *Cilea's Adriana Lecocquer* and *Conradin Kreutzer's* forgotten *Vachtloper van Granada*. Of these only *Cilea's* opera achieved performance.

No such, then, for the impartial facts. Of the two houses, the Metropolitan entitled by far the smaller portion to the sum of the season's important artistic activities, so its share may be disposed of first, and briefly. The single new work brought forward by Mr. Conried, *Cilea's Adriana Lecocquer*, is a very poor thing indeed—dully and trivially imagined, weakly conceived, of no musical distinction and of but slight dramatic interest. Mr. Gustav Mahler, a conductor of extraordinary capacities, who came from Vienna to throw new light into the supposedly multifarious depths of Wagner, Musart, and Beethoven, was none or less responsible for some excellent though not ideal performances of *Tristan*, *Walküre*, *Meistersinger*, *Die Walküre*, and *Fedora*. For the most part, these were given: *Thais*, *Louise*, *Pelléas et Mélisande*, and *Ribera*. Mr. Conried had promised a work new to America: *Cilea's Adriana Lecocquer* and *Conradin Kreutzer's* forgotten *Vachtloper van Granada*. Of these only *Cilea's* opera achieved performance.

Miss Kitty Cheatham

WHO CAN BEEN IN THE CITY IN NEW YORK IN THE CITY

of the orchestra was usually good, that of the chorus usually sufficient.

Of the season at the Manhattan it is possible to write in a different tone. Mr. Hammerstein rendered to the musical public of New York the most valuable service which it is possible for a producer of opera to put to his credit; he brought forward new works of indubitable value and uncommon interest, stirring the currents of musical appreciation with singular vigor and to excellent effect. If his achievements in this sort had been confined to the production of *Thais*, *Louise*, and *Siberia* only, unaccountably important though they are, the record would have been notable. But he did far more; he accomplished the first performance in America of the most original and important music-drama that has been composed since the death of Wagner, *Debussy's Pelléas et Mélisande*, and he produced it in an admirable and truly representative manner. For this service he has not yet been adequately praised or thanked.

Upon the particular events of the season at the Manhattan there have been during the past few months detailed comment in this place. Let it suffice to say now that it has been a season rich in excellence of different kinds. There have been performances memorable in themselves as those of *Pelléas*, *Louise*, *Thais*, *Les Contes d'Hoffmann*; there have been individual triumphs—as the *Meistersinger*, *Die Walküre*, *Die Valkyrie* of Mr. Egan; the *Father* (the *Louise*) of Mr. Gilbert; the *Pelléas*, admirably beyond praise, of Mr. Price; the *Walden* of Mr. Deane; the indubitably skillful and exquisite *Mélisande* of Miss Gailard; and for which that was done by Mr. Tietz, Mr. Sammarco, Mr. Deane, Mr. Zentgraf, Mr. Bass, Miss, Bremer-Gilbert, there should be grateful recognition. Of Mr. Campanelli, who took upon his shoulders staggering burdens, and who wrought miracles by reason of his unflinching soul, his great skill, his personal and artistic force, it may be difficult to speak excessive praise. Nor should one fail to pay tribute to the discreet and able stage manager, to the usually excellent chorus, to the industrious and astonishingly capable orchestra, which contrived to play the new and baffling music of *Pelléas* as effectively as it played *Louise*, *Pagliacci*, and *Lecoq*.

Miss Kitty Cheatham is an artist whose especial and enviable privilege it is to make glad the hearts of children; but it is an even more excellent possession of her art that she communicates to those whose hearts are as eager young a sense, both intimate and vivid, of the ineffable imaginings of childhood. Miss Cheatham accomplishes these ends quite naively and unpretentiously, with a certain spontaneity which makes their effect even more influential. One of the most profound and characteristic of modern philosophers has said that if we allowed children to be our teachers, instead of striving to form their minds and spirits according to our own

grouping wisdom, we should arrive at a clearer understanding of many matters which now are obscure to us. Miss Cheatham would seem to have come to some such conclusion. She seems to understand that the world of the child is a world to be entered with a reverence which must be as scrupulous and sincere as it is tender, if any authentic vision of it is to be obtained and communicated. She achieves very simply, yet with an infinite delicacy, in the midst of its shining wonders, she seems to realize that it is only by virtue of an unimpeachable sincerity that its great and far-extended guardians will condescend to permit one of us duty and would allow to approach its luminous gates.

Thus the person she gives of it seems, one may say, the stamp of accuracy and unimpeachable and informing investigation, answering her the other day at her annual "Easter matinee for young people," at the Lyceum Theatre, one could not but feel that in whatever mood she essayed to declare herself, Miss Cheatham was delivering her essential message to those in her audience who had long since discarded their trailing robes of glory. How many were there who thought then of the words of one who knew deeply many things, and who, with him, regarded "those children who stand on the edge of the horizon, looking over the sea of silence—who never come, but who allow one to dream of the mystery of that which is sometimes forever dead.

A DAY AT HOME WITH THE CAT

DRAWN BY HAMILTON WILLIAMS

East Africa and Back in Two Days

THAT the telegraph and electric cable have inhibited distance throughout the world, through a commonplace of to-day, was related recently by the quick transmission of a message and a reply between New York and a station in British East Africa. Thirty-seven years ago it took Stanley six months of travel through the vast equatorial forests of Africa to reach Ujiji and Livingstone. During almost his entire journey he was lost to communication with the outside world.

At 12.30 P.M. on Wednesday, March 29, cable dispatch was sent through the Western Union Telegraph Company from New York to Nairobi, in British East Africa, a station thirty days' march from Livingstone's headquarters, and a reply was received through the Postal Telegraph Cable company shortly after noon on the following Friday, an interval of less than fifty hours.

The cable dispatch was transmitted first to the Azore Islands, and thence to Lisbon, Gibraltar, Malta, Alexandria, Port Said, Suez, Aden, Zanzibar, and Mombasa, on the East African coast. There it was sent inland to Nairobi by telegraph, and from that point was conveyed thirty miles to the home of the recipient, the total approximate distance being slightly more than 10,000 miles, owing to the difference in time between New York and Nairobi, the message took eight hours in transmission, and consequently was not received till Thursday—otherwise the two days occupied by its journey and the return of the answer might have been shortened considerably.

Alcohol from Natural Gas

It is well known that alcohol can be distilled from every kind of vegetable substance, but that this by-product should be obtainable from natural gas will at first sight bring terror to the prohibitionists of the gas regions. It is not likely, however, that paternalism will convert the gas jet into a worm for an imprudent still, the process of extraction being tedious, complex, and difficult, while the final product is not suitable for the interior economy.

A patent has been issued to Dr. Henry Spencer Blackmore, an industrial chemist of Washington, D. C., for converting natural gas into alcohol. By subjecting it to a limited or restrained oxidation, by the action of heated portions of air or oxygen, in the presence of steam, the gas is converted into a mixture of methyl alcohol, containing a small portion of formaldehyde. It is estimated that 5000 feet of gas will produce fifty gallons of alcohol at a cost of twenty-five to thirty cents.

The Story of Punch

Punch, as well loved by Moslems, still holds its own, though the name "toddy" is in more general use. Toddy and punch are used indifferently as names for the same beverage, and, strangely enough, come to us direct from India.

Punch, or rather punch, means fire. It occurs in the name Panchab (five rivers), and is much used in conjunction with other words to denote aggregations of five male rials; but by the beginning of the eighteenth century the word had begun to acquire its present significance. The five ingredients of punch proper are the spirit which gives the drink its name (as brandy, punch, whiskey, punch), hot water, lemon, sugar, and tea. Of these the last has generally been abandoned. Cold punch is made from beer, while in Roman punch we have a degenerate and chilly variation of the heroic liquor. In Panchab, punch, or rather punch, is, it was till recently, obtained from the leaves of the plant known as the king.

Toddy, colloquially known as tot, while possibly combined with punch, signifies, in the East, the fermented sap of the palm tree. When distilled, this liquor is known as arrack. Toddy is fermented by the native tribes in all parts of the globe.

Thomas Jefferson
Third President of the United States

AMERICA has furnished to the world the most conspicuous Apostle of Personal Liberty that ever lived.

The Declaration of Independence (the creation of his genius) is an eternal monument to his fame—more enduring than statues of marble or bronze.

As a statesman in Congress he advocated the brewing industry as an aid to agriculture and national temperance; and upon several occasions he bought and freighted rum, wine and whiskey to the brave soldiers of the Revolution. He himself declared that the juice of the malt was never absent from his board.

Thomas Jefferson was a splendid athlete, a crack shot, and in his prime at the old Raleigh tavern he delighted to enjoy his "cakes and ale" or dance hall through the night with the fair maids of old Virginia.

At eighty-three he died, regretted by the nation he helped to create. His deeds and written thoughts absolutely and irrefutably prove that good malt beer is not injurious to mind or body.

Flowers of Field Hill, and Swamp

By CAROLINE A. CREEVEY

Author of "Recreations in Botany."

The volume is the outcome of the author's idea that a grouping of plants upon the natural basis of environment, including soil, shade, miniature, etc., is possible. She describes all of the wild flowers commonly met with in the Atlantic States in so careful and thorough a manner that the amateur botanist will find difficulty in readily placing them in their proper groups and families. The illustrations, about one hundred, and fifty in number, have been drawn from the living plants, and will prove to be an invaluable guide in determining the several varieties.

THE MAKERS OF The American Nation A History

WILLIAM A. RUGGLES

E. B. OSGOOD

EDWIN HALL AMES

E. B. OSGOOD

DAVID H. BURTON

An entirely new work, seven years in the making.

The work of author-scholars from twenty universities.

Edited by Albert Bushnell Hart, Professor of History, Harvard.

With the co-operation of four state historical societies.

The first American Historical Atlas—186 special maps.

The standard work—of value for all time.

G. ELLIOTT WOODWARD

JOHN M. MAHAN

CLAYTON K. VAN TASS

DAVID H. BURTON

Harper & Brothers, for 91 years publishers of books, believe this to be their greatest achievement.

From
Original Sources

Q This is the only history dealing with every field of our national life. Our political, economic, religious, industrial, financial, and social life is set forth side by side and in their relation one with another.

The careful selection of authors who could write brilliantly as well as with scholarship and insight has made it possible to carry the story of America through volume after volume with the glow and spirit of romance. It is, above all—interesting.

The volumes are of crown-octavo size, in two styles of binding: (1) Red polished buckram, stamped in gold, with dark-blue leather labels; (2) Persian half-morocco of a rich crimson, stamped in gold, with cloth sides and special end-papers. Gilt tops, untrimmed edges, head-bands, etc.

Send us the coupon and let us mail you—absolutely without cost—our 32-page booklet, which shows why this history is better than all other histories combined. It contains sample pages, illustrations, and maps. Send the coupon to-day.

"The reader who possesses these volumes has before him the choice output of modern scholarship of American history."—N. Y. SUN.

"The American Nation' adds another, and perhaps the best, to the long list of histories of the United States, in whole or in part."

—SPRINGFIELD (MASS.) REPUBLICAN.

"A scholarly work in popular style."—N. Y. TIMES.

FOR THE KINGDOM OF CALIFORNIA

An amazing warfare has been waged in San Francisco during the last two years against the grafters who have had the city in their clutches. The side of the prosecutors and the side of the prosecuted have been set forth over and over again by partisans—each vehemently, violently, blindly—claiming to be right, each calling the other side names—and such names.

Now comes from outside the state, a sane, impartial student of affairs, a trained observer, Mr. William Inglis, staff correspondent of "Harper's Weekly," who, after six weeks' study of the situation, tells plainly, without passion or prejudice, what seem to him to be the facts. The result may not be of interest to Californians—they are sick of the whole mess—but outside of that great kingdom of a state—the public wants to know.

The first article will appear in the issue for May 23.

HARPER'S WEEKLY for NEXT WEEK

THE BEST GOLF BOOK

Practical Golf

By
WALTER J. TRAVIS

Mr. Travis, who won the amateur golf championship of the world, gives in these practical papers the results of his own experience and practice. Mr. Travis is not only a player, but a student of golf. He has worked out its principles for himself, and in this manual he has set them down in order for the benefit of others.

The book is profusely illustrated from photographs. Crown 8vo. 200 pages. Price, \$2.00 net

HARPER & BROTHERS, NEW YORK

THE SERVANT IN THE HOUSE

By
Charles Rann Kennedy

We do not publish plays—but here is a drama so great, so compelling, so reverent, so akin to all the beautiful and permanent things in life, that it is more than a play, more than a novel, more than a mere book. It is a page from life itself, revealing the brotherhood of man as a real, breathing thing; showing how the impossible has become possible. According to the critics, "Not in a lifetime has such a wonderful play been created"—and it reads as well as it acts.

"I have tried to set forth the only feasible law in society, that of a spiritual brotherhood among mankind, which is both Christianity and Socialism."

—Charles Rann Kennedy

With Eight Photographs from the Play.

COMMENT

Brother Bryan Inquires

This query, which it calls "A Full-grown Question," the *Commoner* prints weekly in its first column in type of increasing size:

What is the extent of the financial interest held by JACOB FULTZER, owner of the *New York World*, in railroad companies and in great corporations commonly known as trusts? This is a pertinent question because an honest answer might uncover the special interests for which the *New York World* speaks in its present-day attacks upon Democrats.

We don't know what Mr. FULTZER's investments are, but suppose, for the sake of argument, that he had a million dollars in the stocks of the United States Steel Corporation, and another million, say, in the stocks of various railway companies. Would that explain to Mr. BRYAN's satisfaction the reluctance of the *World* to accept him as its candidate?

And if so, Brother BRYAN; why? What do you propose to try to do, if you ever reach the White House, to make the securities of the Steel Corporation and of all the railroads less valuable than they are at present?

Do you wish it to be understood that you declare yourself to be the enemy of all the railroads, and therefore a natural object of apprehension to every owner of a railroad security? Nothing less than that is implied from the question you put to Mr. FULTZER. But, Mr. BRYAN, the face value of the securities of the railroads of the country foot up to about fifteen billion dollars, and in 1907 the roads earned \$700,000,000 and paid their owners over \$560,000,000 in interest and dividends, besides paying high wages to fifteen hundred thousand employees. If you regard yourself as the enemy of so large a share as that of the property of the country, you might as well stand up as the enemy of all property, for if you could succeed in doing serious damage to the railroad property of the country, you would injure the marketable value of every other kind of property that the country has.

Are you the enemy of all property, Brother BRYAN, or do you make an exception of lecture-earnings invested in farms and farm buildings (and perhaps farm mortgages) in Nebraska?

Railroads Not Special Interests

Mr. BRYAN speaks of the interests of the railway companies as "special interests," intimating that they are somehow opposed to the interests of the people in general, and that persons who are concerned for them are in natural opposition to measures and candidates which make for the welfare of the mass of the people. A more mischievous delusion could hardly be inculcated. We can think of no business interests that are quite so general, quite so intimately bound up with all the business interests that await and long for prosperity, as the interests of the railway companies. If an owner of

railway securities is warranted in opposing Mr. BRYAN's candidacy, every business man in the country, every farmer, every mechanic, is warranted in opposing it. The business of the country cannot be built up on the ruins of the railroads. When the arteries go wrong, the man is sick, no matter how healthy his brain, his stomach, and his muscles may be. If the man is to be healthy, his arteries must be in a healthy condition. If the country is to be healthy, its railroads must be in a healthy condition. In so far as Mr. BRYAN is opposed to healthy, prosperous railroads and is a natural object of distrust to holders of railroad securities, he is an enemy to the health of the whole body politic and industrial. A healthy country with sick railroads cannot be.

The Big Issue

Governor JOHNSON says he will be heartily for BRYAN, HARRISON, GRAY, or any other chosen Democrat, provided the Democratic platform suits him. The tariff, he says, is the big issue in the coming campaign. We don't hear anything like this from Dr. BRYAN. He is not making offers as yet to support JOHNSON, or GRAY, or WALSH. He is for tariff reform, but is that the big issue as he sees it? No; the issue for him is the same as for Hamlet: "To be, or not to be; that is the question." Governor JOHNSON does not seem to care for Dr. BRYAN's issue. We find him unfeelingly declaring his satisfaction in the assurance that the twenty-four delegates from New Jersey, though uninstructed, will be for JOHNSON.

Some Topics of a Candidate

Governor JOHNSON is quoted as saying in Detroit: "New York has no connection with my candidacy. My support will have to come from another direction than Wall Street. I may say that I have had no relations, politically or otherwise, with the other side of the Hudson." But never mind what he says of New York, nor even of trans-Hudson Connecticut, and tariff-revising Massachusetts, handy States though they be when it comes to counting votes. Of more concern to his candidacy, because of its bearing on his discretion, is what he says about Canada. A philosopher or statesman ruminating about the future may say that our flag must finally fly over Canada, but it is not a sentiment that is helpful to a Presidential candidate, nor to the achievement of an end that is very near to Governor JOHNSON's Northwestern heart—commercial union with Canada. It is true that the Governor believes that destiny will bring about our union with Canada without lapse of amity or a gun fired except in salutes; and that may be; but there will be nothing about it in the Denver platform, and the mere suggestion of it will so abrade the feelings of Mr. KILPATRICK for that reason alone it is kinder to talk about something else.

Peace, and the State Violation of Treaties

The recent debate in the Senate on the PILES amendment to the naval appropriation bill appears to have deteriorated at times into a game of bluff—most noticeably when Senator REVERE observed that "what information the Executive has in his possession no man knows." Now very few of us think or have ever thought that the Executive has any such information as it is obvious the Senator from Indiana hoped his colleagues would infer from his words just quoted. However, it is no Executive secret that the peaceful relations at present existing between our own and every other country are seriously endangered by what Senator LORAIN in the course of this same debate characterized as "the monstrous doctrine that one State may commit acts and plunge forty-five States into a war without the nation having anything to say about it." Of course it is not for us to attempt to define the limits, if there are any, upon the treaty-making power of the President and Senate, but it is not necessary to do so in order to show the seriousness of the existing danger.

A Law Needed

For it is indisputable that at least the Constitution declares that in most cases the treaty shall prevail over the State enactment, and yet—and here lies the danger—it does not provide specifically any means by which the Federal government may compel the State to acquiesce to such prevariance. Hence, as the law stands today, a State may enforce any enactment, however manifestly in violation of a treaty provision, without

as the Senator from Massachusetts says, the nation having anything to say about it. Nevertheless, there seems to be little doubt that the nation has the right to correct the situation by legislation; in the case of *BALDWIN v. FRANKS* the Supreme Court gave it as its opinion—

That the United States have power under the Constitution to provide for the punishment of those who are guilty of depriving Chinese subjects of any of the rights, privileges, immunities, or exemptions guaranteed to them by this treaty [of July 28, 1868, with China] we do not doubt.

Indeed, even now certain members of Congress are interesting themselves in a bill to make every State violation of a proper treaty provision a criminal offense against the United States. Probably during the next session we shall hear more of this bill. It certainly deserves serious consideration.

One Plank

The first State platform of the Independence party has been constructed. Here is one plank—we wonder what the socialists and other people who refuse to be dubbed socialists will say to it:

Our aim is just government, not more government.

Such an aim on the part of any party seeking power seems so obviously requisite as hardly to need to be expressed. However, in the case of the Independence party it was, perhaps, unadvisable to omit its specific declaration.

Not at all Serious

Our Virginia contemporary, the *Richmond Times-Dispatch*, sensibly observes:

In favoring it with a column of its valuable editorial space, the *extreme New York Times* appears to take too seriously the silly black and white dinner of the Cosmopolitan Society of Greater New York.

Quite so. The reports of the dinner in question sent out to the newspapers by the United Press Associations were sensational and untrue, both as to what was said and done, and as to public concern about it. Of the speakers who were reported to have spoken in favor of the marriages of whites and blacks, the only one who did not promptly repudiate the sentiments attributed to him was a Frenchman. Free discussion and exchange of sentiments about race questions between white people and black is a thing much to be desired. The chief practical effect of the Cosmopolitan Society's dinner seems to have been to increase the difficulty of having such discussions, which is a pity.

Three-cent Fares in Cleveland

A seven years' street-railroad fight in Cleveland ended on April 21, when the citizens of the town took free for that day on the street-cars in honor of the end of the war and Tom Johnson's victory. The victory means that the city through a holding company operates the lines that were lately the properties of the Cleveland Electric Company and the Forest City Railway Company, and the fare on all the Cleveland street-cars is now three cents. Whether the roads can be operated at that rate to the satisfaction of their patrons is still to be discovered. Tom Johnson says they can. The late operators say they cannot. The present owning company, the Cleveland Railroad Company, knows all the lines to the Municipal Traction Company, which is to operate them, not for profit, but for the benefit of the people. The Traction Company has a fifty years' lease, renewable for fifty years more. It has a board of five directors which is self-perpetuating. As lease of the property it must operate it, keep it in good repair, set aside funds for improvements, extensions, accidents, and all obligations, and pay six per cent. in dividends to the owners, in default of which the owners—the Cleveland Railway Company—get the property back. Tom Johnson says the three-cent fares can do all that is required of them. If they can, and Cleveland can have permanently a good railway service on a three-cent basis, Tom Johnson will undoubtedly have done the city a service comparable to that traditionally rendered to society by the man who makes two blades of grass grow in place of one. The fight has been long and hard. The ins and outs of it are too many to attempt to record here. The candidacy of THOMAS HARRIS for Mayor against Johnson was one incident of it. It has been an open and honest fight, however, for the Cleveland Electric Company, which has finally been beaten, partly through the expiration of some of its franchises, has been, under the presidency of

HORACE ANDREWS, one of the most upright and fair-dealing street-railway corporations in the country. Mr. ANDREWS fought hard but he fought fair, and in now, what has always been—one of the most respected men in one of the most respectable cities in the Union.

The Case of Oleomargarine

Butter is worth from twenty-five cents a pound up. Oleomargarine brings, we believe, about eighteen cents. Animal fat is the chief ingredient in both. Chemically they are very much alike. Gastronomically they differ, with the difference in favor of good butter as compared with good oleomargarine, and in favor of good oleomargarine as compared with bad butter. Sentimentally there is a great difference, and all in favor of butter. By a Federal law white oleomargarine is taxed one-fourth of a cent a pound, but if colored to look like butter it is taxed ten cents a pound. Its manufacture is carefully regulated by Federal law securing its wholesomeness, and every package of it is stamped with its name, so that it will not masquerade as butter. So far as those regulations insure proper conditions of manufacture, and prevent the sale of oleomargarine as butter, the oleo-makers welcome them, as giving a government guarantee of the wholesomeness of their product. But they object strongly to the tax, which practically forbids them to color their product to the hue that realizes the popular ideal of the color of butter. The butter-makers can color their product to suit the popular eye. The oleo-makers cannot. They want to have restored to them the privilege of selling butter-colored oleo, just as the winter butter-makers sell butter-colored butter. What does the dispassionate reader think about it? Oleo is comparatively cheap. It is understood to be a good food, perfectly wholesome, and the best possible substitute for butter. Cheaper foods are needed extremely by hundreds of thousands of people upon whom the cost of living presses very heavily. Here is one that is partially excluded from general use in this country because the law forbids to give it an appetizing appearance. If it is made to look like butter, the strict and ethical law now operative will still protect the buyer from being misled by it, but the consumer may in some cases suppose it is butter and eat it as such. In this State the consumer is protected by a law passed last year making it a misdemeanor to serve colored oleo to any one who pays board or receives board as partial consideration for services. Here is a curious state of things; a useful food needed apparently by thousands of consumers is either practically prohibited by local laws, or is heavily taxed in order that it may not compete injuriously with another and better product, which people who can afford to have it will always prefer, but which thousands of American consumers cannot afford to buy. And the trouble is all a question of color. The oleo people can make and sell their product so long as it looks like oleo and not like butter, but the butter people, when their product looks like oleo, are permitted to give a better complexion. That seems hardly fair. To protect butter against honest competition is not fair, either. Whether it is fair to compete with butter with a product that is not butter, but tastes like it, and is colored to look like it, is a question that is evidently debatable.

Is He a Ripener?

Candidate TART says he has always been for woman suffrage, but the time is not ripe for it yet. But is he for ripening it? That is the real question, and the same applies to Filipino independence.

People Who Don't Know

The papers say that President ROOSEVELT gets from three to four hundred letters a day urging him to run again. We presume he does, and that fact, if we may accept it as a fact, marks the particular stage of intelligence, discernment, and moral responsibility attained by these letter-writers and the considerable body of our people that they represent. They do not find it an obstacle to Mr. ROOSEVELT'S running again that he would have to break his word to do it. He does; but they do not. They do not seem to understand at all that a man may value the immaterial thing called his honor. Neither do they understand that being their President is a thing that even an ambitious man may in time get tired of. It may not be true, as the papers say, that Mr. ROOSEVELT has planned to go hunting next year in deepest Africa, and

that he yearns to regain the private citizen's privilege of giving his seat to a lady in the street-car and carrying his own suit-case; but those are yearnings entirely proper and natural to a still-human creature who has been President for nearly seven years. WASHINGTON had like yearnings in his day.

The Best that Can Be Said for It

BYAN's nomination means TAYLOR's election.—*New York World.*

The Greatest Job Going

The great need of our country (as of the rest of the world) is civilization—the knowledge how to live, and the will to live according to knowledge. Civilization will mean to us, among other things, capacity in the voting population to select experts to make the laws and enforce them and perform the duties of government. It will mean such things as the wise adjustment of the tariff to existing conditions; the best solution of the currency problem, the drink problem, the city government problem, the great problem of how best to teach the rising generation to be good as well as capable. It will mean the repeal of foolish laws and the enforcement of the rest; the diminution of waste; the cutting down of fire losses in the United States by \$125,000,000 a year; a great reduction in the annual loss of life by homicide and other forms of violence; the decay of graft; the preservation of the forests; the just administration of public utilities, the vast improvement of manners in men and newspapers; more money; more sense; better health; more liberty; more obedience to law; more leisure and more fun for every one. What the wiser socialists want and work for, what the churches want and work for, and what all wise and good people strive, consciously or not, to attain, is civilization. It comes slowly and fitfully, but it seems to come. Our great care must be to insure to our specimen of it its broad foundation that, once attained, it cannot topple over. Wonderfully inspiring is the vision of a truly civilized country, forging grandly ahead under wise laws and a proper system of checks and balances; rich, strong, busy, and peaceable, prosecuting vigorously the interminable exploration of Nature and the discovery of her secrets for the benefit of mankind. Whoever has a conscious part in bringing civilization along has a hand in the most inspiring work there is. All workers—farmers, mechanics, teachers, ministers of religion, capitalists, politicians, doctors, lawyers, and even the brokers and the legislators—should so manage their conduct as to be able to treat themselves to the persuasion that they have a part in this vast work and are doing their share. The legislators help and hinder by turns, according to the extent of their knowledge. We presume, for instance, that New York State Senator POSE is trying to help by his bill "to prevent the abridgment or encroachment of 'The Star-spangled Banner' in the public schools of this State"; but might he not better spend his strength on a bill to prevent the enactment of unnecessary laws?

Is an Invasion of England Practicable?

It is noteworthy that British public opinion is beginning to veer from the confidence in the inviolability of the British Isles, which seemed to be so widespread and so deep rooted up to three years ago. As lately as May, 1905, Mr. BALFOUR, then Prime Minister and Chairman of the Committee of Defense, declared in the House of Commons that "a serious invasion of these islands is not a probability which we need consider." Two years had not elapsed, however, when Mr. ROUSSEAU's justification of the redistribution of the British navy made it evident that either there is considerable diversity of opinion on the question, or that events had happened in the intervening two years to compel the rulers of the United Kingdom to change their minds. The latest and gravest warning to those Englishmen who are dwelling in a "land of paradise" is embodied in an impressive book entitled *The Identity of the Atlantic*, by Mr. FREDERICK A. HISLAM. This is an inquiry into the development of German sea power past, present, and prospective, and into its significance for Britain. Mr. HISLAM begins by stating that even now the British fleet is not organized on a basis which puts a German invasion of Britain beyond the pale of things to be considered.

It is customary to say that Britain has not been successfully

invaded for nearly nine hundred years, or, in other words, since the landing of WILLIAM the Norman in 1066. Why that starting-point should have been selected is obvious. It was the one so readily effective point to begin at. To say nothing of the measure of success obtained by the familiar invasion of Scandinavians in ALFRED's time, which resulted in a permanent successor of a large tract in northeastern England, or of the invasion of the Danes in the early part of the eleventh century, which made CANUTE King of England, Mr. HISLAM directs attention to an even more remarkable incident which occurred near the close of the third century of our era. We are reminded that during the successful revolt against the Roman dominion by CARACALLA, who, at the head of a large fleet, had been made "Count of the Saxon Shore" and invested with the duty of suppressing the pirates of the North Sea, the fleet of expropriated Franks which was coming up from the eastern Mediterranean through the Strait of Gibraltar to join CARACALLA, was met and obliterated by the Roman fleet under CONSTANTINE. The Roman then made preparations in Gaul for the invasion of England, and while he was so engaged, CARACALLA, who had proved himself a capable naval commander and a worthy ruler of Britain, was murdered by one ALEXANDER, who thereupon assumed the purple. CONSTANTINE, on his part, rapidly pushed forward his preparations, and in A.D. 286 an invasion was undertaken by a squadron under the command of AMBROSIOLEUS, an officer of distinguished merit. The weather was favorable to the enterprise. Under the cover of a thick fog the Roman vessels escaped the fleet of ALEXANDER, which had been stationed off the Isle of Wight to intercept them; most of the invaders landed in Kent, but one division of their fleet, which had parted from the remainder in the fog, found itself in the Thames, and pushed as to London. Then and there it was demonstrated to Britons that a superiority of naval strength will not always protect their country from a foreign invasion. Mr. HISLAM thinks that this incident has received less attention at the hands of British historians than its importance merits.

We pass over the repeated landing of foreign forces on British soil in the reign of STEPHEN, in that of KING JOHN, in that of EDWARD II., in that of HENRY VI., and in that of EDWARD IV.; the triumphant invasion of the "invulnerable" by the Earl of Richmond (afterward HENRY VII.), in 1485, and by WILLIAM of Orange in 1688, and, finally, the landing of the Young Pretender, CHARLES EDWARD, in Scotland in 1745, when he succeeded in leading a Scottish army across the border as far as Derby. Those precedents are generally ignored by those persons who assert that Britain's fleet makes the island immune from invasion. Another forgotten incident is that nothing but the state of the weather rendered fruitless the French expedition under HOUE to the southwest coast of Ireland in 1796. As Mr. HISLAM points out, the presence of a superior British fleet in the Channel had no effect upon that venture.

The author of this book recalls that in 1805, when the grand army of NAPOLEON was based on the French coast of the Channel, vehement and unceasing prayers were offered up in the churches of England against the fog, which betrayed an uneasy consciousness that naval superiority might not prove an adequate defense against invasion. Atmospheric fogs are bad enough, but there are also the fogs of false intelligence and the fog of no intelligence at all. There is also the fog of indifference and incredulity. Mr. HISLAM is convinced that the most important "fog" which his countrymen have to contend against is a surprise attack. The conditions making for Britain's security against a surprise attack have been summarized by Mr. E. P. JANE, who insists that the landing of invaders on English soil would have to be the first sign that a state of war existed or was likely to exist. In other words, nearly 100,000 men would have to be massed on the German coast without exciting suspicion; secondly, the vessels needed to carry them and their supplies—something like 200 ships—would also have to be collected without exciting any suspicion. Thirdly, the British fleet would have to be dispossessed from arriving on the scene too quickly after the disembarkation. Fourthly, and lastly, the invading army would have to march on London (or the naval base), carrying all before it. Mr. HISLAM, for his part, believes that a carefully matured scheme for an invasion of Britain has been evolved by the German General Staff. He admits, however, that no such scheme would have any chance of success unless the invasion came more or less as a "bolt from the blue." Mr. HISLAM acknowledges that a bolt from an absolutely clear sky is inconceivable, but he reminds us that England is recent years, as well as in old days, has displayed much levity on the approach of international difficulties. Moreover, the inherent inclination of Englishmen to believe that any nation could dare to take up arms against them is so firmly planted, while, on the other hand, determined nations with definite objects in view have so often disregarded the supposed conventionalities of war, or seized upon the slightest pretext for putting their pre-arranged ideas into execution, that a cloud in the "blue" no larger than a man's hand would probably go unmarked by the people until the advance of a hostile army broke the storm over their heads in

irresistible fury. It is a fact, as General MACMAHER has shown in his remarkable work, *Hostilities Without Declaration of War*, that in the hundred and seventy-one years from 1700 to 1870 inclusive, less than ten instances occurred where a "declaration of war" was issued prior to the opening of hostilities. In forty-one of the cases where no declaration was made the manifest, and sometimes avowed, motive was to secure advantage by the suddenness of the movement, and the consequent surprise of an unprepared enemy. Much a surprise would be far more easy in the twentieth century than in the eighteenth, owing to the development of means of communication, the facility with which physical obstacles can now be overcome, and the perfect knowledge of ground furnished by good maps. Mr. HUNTAM accepts as valid the computation that to-day 200,000 men could be concentrated in the German North Sea ports within thirty-six hours. This is probably from twice to four times the number that would need to be added to the garrisons of the coast forts for the purpose of an expedition. He adds that no antecedent concentration of shipping would be needed, for there is always in the German ports more than sufficient for the conveyance of a large army across the North Sea, and there is good ground for the assertion that every German ship of importance has its crewer one of these ports has assigned to her, on paper, the military force she may at any moment be called upon to transport to the English coast. Mr. HUNTAM is convinced that the disembarkation of 15,000 German soldiers could probably be carried out within ten hours. He differs also with Mr. E. P. JANE in thinking that it would be necessary for an invading army, once safely landed on the British coast, to march on London or the naval bases. He believes, on the contrary, that its primary objective would be the manufacturing centers in the north of England, where the appearance of a hostile army would do far more to dislocate the internal organization of the country than any operations in the south could do. The fact is recalled that Lord Overstone in 1850 explained what might be expected in such circumstances. He predicted that the committed and delicate network of credit which underlies all the multitudinous transactions of Great Britain would vibrate from end to end on the first touch of British soil by a foreign invader, and would in all probability be subject to a sudden and fearful collapse, while the confusion and distrust produced among the laboring classes would be appalling. Such would be the immediate consequences of the mere landing of an invading army without reference to the success of its ulterior operations.

The Temptations of the Occult

"How very hard it is to be a Christian!" ejaculates BROWNING, as the opening of his "Easter Day"; and returning from a theosophical lecture, a very natural parallel thought is, "How very hard it is to tell the truth!" One may say that fiction is a perfectly legitimate product, and that the exercise of the imagination is an invaluable aid in all the sciences, and this is true; but, after all, progress is ever toward skill, accuracy, the sense of the reality of facts. If we are going to exercise the imagination, if we are dealing in fiction, it behooves us to label our occupation accurately, otherwise there is a definite moral loss to the thinker, and a twofold flimsiness about the product which is pitiable. As one listens to the claims of the modern theosophists, one cannot but regret that so much real fancy, such zealous landscape-gardening in the infinite, should have gone astray. The same power and persistence applied legitimately might grow into literature, poetry, fairy tales, romances, and yet save the high sense of honesty of the theosophist.

The theosophist claims, among other matters, to be able at will to leave the material body apparently asleep, while in a so-called astral body he pursues his calling, studies, inquires with highly developed occult powers into such matters as the ultimate structure of matter, sees life in disaster and accidents, and finally claims that it is one of the special functions of the trained theosophist to instruct the newly dead. It would be difficult to refute this last claim, but if, indeed, the theosophist can pursue his rilling through all the hours when the average mortal rests, his attainments should be much greater than they are. As a matter of fact, some of those who make the lightest assumptions and write most voluminously of their powers have not taken the trouble to learn to write English correctly. But this is a minor detail. The great point is, that the theosophists refuse to give the legitimate proofs of their power. The instant a proof is asked, there is evasion.

In this day and generation only the flippant or the most hardened materialistic mind will fail to see that there are more things in heaven and earth than are dreamed of in our philosophy. Coincidences, premonitions, unaccountably simultaneous thoughts working at a distance, dreams that bear striking relation to facts otherwise unknown and unknowable, are constantly cropping up to the bewilderment of the questioning mind. Occasionally if we look into such matters seriously enough we can find a possible explanation, but just as often, so far as we can say, the experience

has to be thrown over the borders and left among the matters unexplained and unexplainable.

But here is the danger of the occultist. It is a truism to say that what we look for in earnest we find. The occultist has a thesis to prove. He is bent on making the world believe that he has caught and banded all these evasive and subtle forces, and can make them work in terror. To his claim there is but one answer: "Do it!" But the proofs are nothing more than tales such as we are all familiar with, hearsay prognostications, strange dreams, and certain telephic phenomena. The danger, then, to the occultist is, that in his keen desire to prove the unprovable he shall lose, or even warp, his sense of truth. An interesting experiment is to get an imaginative and emotional person to tell a strange and vivid dream over some half-dozen times. Unless such person is deftly veracious, and given, too, to self-scrutiny, the dream will come out the sixth time with a wealth of coherent detail and fullness of matter quite literally undreamed of in the first account. This is the natural tendency of the mind: give it a start, a good suggestion, and of its own accord it pushes ahead, filling out, completing, enriching. It is a natural and legitimate instinct; but real mental progress, after all, must wait upon truth to feed. If we really gain anything valuable, we must be able to detect the very point where fancy enters the game. We must be willing to make slow and patient investigations, careful computations of how much of an unaccountable experience is chance, how much half-conscious observation, and how much home-fide miracle. To exaggerate, to assume, to juggle with fact is to cheapen and to vulgarize. However much the juggler lary that he is working in the interests of humanity, he is led astray. Nothing is so important among men as the simplicity and sincerity which make for faith—the power to rely upon testimony. No miracle is more precious than this faith of men in one another. When one realizes what a treasure faith in character is, one can almost understand how indeed a Supreme Being might value the power of faith in humanity above all others, use it as a kind of touchstone to bring out the best that is in the creature. There is no greater miracle than our constant intuitive judgment of character. We enter an unknown presence and instantly only we feel the quality of it, we trust or distrust, like or dislike, and in the sensitive a first swift impression is apt to be truer than any acquired knowledge: in many of us intuition is surer than reason. Was it CAELEY or EMERSON who said that all the while a man was vociferously explaining himself to you, what he really was was looking over his shoulder, clearly perceptible. So it often seems nothing a man can say about himself will take the place of this unreasoned perception of what he truly is. But even this intuition of character is not yet reduced to surety and science. It is not fair to assert, as the occultist does, that the intuitive powers are a sign of spiritual exaltation. They go occasionally with highly spiritual natures, but just as often with gross and indelicate perceptions. And just as long as such matters are uncertain—in the air, as it were, irreducible to method and accuracy—just so long does all possible gain lie on the side of frankly admitting it.

But there are other dangers for the occultist. One is the danger of despising our legitimate instrument of knowledge.

"To man—propose this test.

The body at its best

How far can that project thy soul on its lone way?"

It may well be that by trying for miraculous means to knowledge we may miss our most precious heritage, the simple, earthly knowledge of human, eye, and divine relations that filters in to us through these much despised but, after all, strongly and cunningly wrought senses of ours. Is it not something that man has builded up with them such wonderful ideals of beauty, of valor and fidelity? If we can fancy a universe teleological at all, then the body as an instrument must have its own profound purpose, and liberation from it should be awaited (if it come in its due course). After all, too, it has not been the occult worker who has benefited the world most or helped to make it habitable, but the patient, slow, unobtrusive worker, reverent of fact, who has delved into truth for truth's sake, testing and retesting the facts, weighing evidence, seeking for accuracy and precision, inviting scrutiny, anxious to detect mistakes, flaws, living the work not for the goods it may deliver at once, but far sightedly hoping little by little to add a grain to the heap of human knowledge.

And, after all, is not the straining for the miraculous a mere sign of our desires? If we were really alive, what greater miracle should we need than the miracle of growth? "The flower in the cranial walk," the wonder of life, the tiny seed pushing down its roots and raising its blossoms, the miracle of man's courage and perseverance, the miracle of human charity and fidelity and self-sacrifice, the great, visible, ordered universe about us, are these not enough to keep us forever a-tiptoe with wonder and excitement? And, after all, do not they offer a finer sense of the miraculous in the world than the void and self-defeating researches of those who play upon the confines where body and spirit meet but do diverge?

Personal and Pertinent

MR. VIVIAN CARTER says that the feminine reader, as matter how intelligent she be, prefers a story which has the relation of the sexes as its point. This is not a new comment, nor a verifiable one, nor a particularly brilliant one. BRYAN some time ago mentioned something about the subject being of man's life a thing apart and woman's whole existence, and MR. JAMES more lengthily reports that it is a characteristic mark of the feminine, as distinguished from the masculine, hand that in any little portrait of a corner of the world's affairs the love story will be predominant. In view of these unanimous opinions it is interesting to note how slight a part the love story plays in MISS GLASSBORO's books. Indeed, in *The Ancient Lane* there is hardly any love story at all; also in *Mrs. Wharton's Talley of Decisions* and *The House of Birth* the emotions are duly chastened and largely subordinated to extraneous material. On the whole, we find women, as readers and as writers, interested to about the same extent as men in the love story. The relation of the sexes is, by the nature of things, likely to be a more or less absorbing matter between the ages of twenty and thirty, and after that a woman is as like as a man to relegate it to a back seat.

MR. UPSON SINKLER has written from Bermuda to the *Piscataway Review* to explain, in reply to criticism, how he qualified himself to write a novel about New York society. He says he got his facts from persons who circulated in the said society, and who gave them to him willingly at his request. Beyond that he does not disclose any qualifications, except the ability to write. The trouble with MR. SINKLER's book was not that the individual facts were incredible, but that the picture as a whole was not a true picture of anything entitled to be called "society" in New York. It is a fair question whether there is in New York anything entitled to be called "society," so loose, haphazard, and peculiar is the social organization of that town. The fact that the town is constantly gathering in new people, some rich, and many who aspire hopefully to become so, makes "society" in it particularly hard to locate and define. It is good or bad, none or crazy, decent or otherwise, according to the size of the picture camera will take, and the place where you snap it. Anybody who takes MR. SINKLER's book seriously will suppose that New York society is mainly composed of particularly drunken and crazy folk, who are speeding to perdition by the shortest route at an enormous cost for fuel. Of course that is not so. In New York great fortunes fall now and then into incomparably foolish hands, and there is always a great deal of new money that does queer things, but though it is matter for discussion whether living in New York is a habit or a vice, the general run of people there is society or out of it are sane, and behave as if they were like folk in other places, except that they are used to more shows, taller buildings, a more stimulating atmosphere, and a greater variety of acquaintance.

Correspondence

WANTS TO KNOW SEVERAL THINGS

To the Editor of *Harper's Weekly*:

Sir,—You frequently caricature and criticize Mr. W. J. Bryan, and it is only fair that you should allow something to be said on the other side, for certainly the man has some good in him, else half the people of this country would not be "for him." I am a plain Missourian. I have read your paper with pleasure, more or less, all my life. Kindly honor me with a "seat" in your "Correspondence Column," as I wish to ask a few questions; to be "shown," as it were.

Do you honestly believe, in the light of recent developments, that Governor John A. Johnson or Mr. Woodrow Wilson would make stronger Democratic Presidential candidates than Mr. Bryan would? If Mr. Bryan is the weakest of the three, why do not the Democrats demand money or else? If so, why do not the people of this country, who mean to buy, not mean to receive or dictate to the people. Mr. Bryan for twelve years has had to contend against the power of the Republican party entrenched in office, against an almost universally hostile press, against Wall Street and organized wealth, and against a strong current of disaffection of the old so-called conservatives in his own party. He has also been handicapped by two defeats (one of them was laughable or stupid). Yet he is so strong to-day that no other man is seriously considered by the great masses of the Democratic party. Certainly, with all the facts before you, you cannot figure out by any law of logic that any man in the party would make a stronger candidate than Mr. Bryan. If so, why do not the people of this country for some one else? This manufactured strength from the factories and sanctuaries of New York will not be accepted again, this year at least, by the great body of Democrats in this country. The noblesse returns of 1894 have satisfied them with the fortunes for a while. Even this State, for thirty years solidly Democratic, was lost by the conservative candidate of 1901.

Speaking of the conservative candidate of the last election, will

you tell me what "conservative" means? You are *the* conservative of the conservative time we reached information. It is certainly means to conserve something that we already have. Does it mean to conserve the municipal, State, and national administrative systems we have had since 1884, say, and down to the beginning of the present Roosevelt term, when such men as Whitely and Hill directed Democratic campaigns, and Mark Hanna made Republican Presidential? Were they the "safe and sane"? Do conservatives mean to conserve the political methods of that period, now admittedly the reign of financial terror, of trust building, insurance, and public-utilities plundering, of railroad domination, of manufactured panics, of protection robbery, of "high" finance run riot, etc., or what does it mean? What else have we to conserve of that period? What are the good things? Isn't conservatism opposed to progress? Is Mr. Roosevelt popular because of his conservatism or his so-called radicalism? What makes Mr. Bryan popular? Why are they popular with the people and unpopular in Wall Street? Which is the stronger candidate, the one who is popular in Wall Street or with the people? Can a candidate be strong with both?

Have we a "sound" financial system now? Do you want to conserve it? If so, why the Aldrich and Fowler bills? Why the financial "furry"? If the Democrats had been in power would it have been a mere "furry" or the "worst financial upheaval in the history of the world"? Would you conserve the system that enables Aldrich to "run" the Senate and Cannon to boss the House, and Elkins to head interstate commerce committees? What feature of our institutions or mode of administration would you conserve that Mr. Bryan would not? We have no chance to elect any reformer but Mr. Bryan. Do you favor conserving the old games and systems, or do you favor progress? If the latter, why do you not use your influence for Mr. Bryan? Don't bring up 16 to 1—that's dead, though the principle was right. You cannot deny that Mr. Bryan is clean, honest, and able. He advocates pure government, and the rights of man—poor as well as rich. This makes him the friend of the laboring man. Last week the Bricklayers' Union and other affiliated organizations, 180,000 strong, passed resolutions in New York endorsing Mr. Bryan as the friend of labor. Does that show weakness as a candidate? Why did they not endorse Governor Johnson or Mr. Wilson, if they are the strongest? Why is the metropolitan press against Mr. Bryan, while the State Democratic conventions are instructing for him with such unanimity? Is the press losing its power to "mould" public opinion? Are the people losing confidence in editors—I mean the wise ones of the East?

I am, sir,

HARRY HIGGINS.

RAUPTIME REFORM

Scranton, Pa., May 1, 1901

To the Editor of *Harper's Weekly*:

DEAR SIR,—Referring to your editorial in the issue of the 22nd ultimo in reference to folks who don't know "what is for and who do not measure up to the spirit of the times as Mr. Thompson and his bosom friend see things, I think we can learn what is the matter just now by reference to a side remark of our quiet authority on the psychical down to the physical, even to deposed life—Dr. Jordan of Leland Stanford Junior University—as follows:

"We hear much in these days of the wickedness of power, of the evil behavior of men in high places, of men whom the people have been perforce obliged to trust. This is no new thing, though the struggle against it, the combination of the forces of reform and backwardness, of dreamers and highwaymen, is offering some new phases."

"There is a kind of music popular with uncritical audiences and with people who know as little, which answers to the name of 'ragtime.' It is the music of those who do not know good music or who have not the moral force to demand it. The kind of ragtime is not confined to music; graft is the ragtime of business; the spoils system the ragtime of politics; adulteration the ragtime of manufacture. There is ragtime science, ragtime literature, ragtime religion. You will know each of these by its quick return."

I am, sir,

JNO. J. JONES.

WASHINGTON'S SURPRISING ANCESTORS

Memphis, Tenn., S. A., April 1, 1901

To the Editor of *Harper's Weekly*:

Sir,—Referring to the article entitled, "Washington's Surprising Ancestor," by Candace Tucker, which appeared in your issue of February 15 last, it may be interesting for you to know that had you (or she) continued the genealogical tree further back on the de Sauton side, you could have shown Washington a direct descendant of two kings, the other being Henry I. of France.

I am a member of the branch of the Ruggles family in direct line of descent from John de Sauton, Baron of Dudley and son of John de Sauton and Margery de Sauton, heiress of Barry of Dudley. This Margery de Sauton was a direct descendant of Lady Isabella de Sauton, the Earl of Salisbury's sister and daughter of Hugh the Great, Count de Valenciennes, who was son of Henry I. King of France, and his wife Anne of Russia.

You can read readily trace and confirm this fact, if you so desire, by reference to the Ruggles Genealogical Tree which has been published in book form.

I am, sir,

GEO. S. LANE.

Finance

Is the Maintenance of Iron and Steel Prices Warranted?

By HOWARD SCHENCK MOTT

EVER since the present depression in business began severe cuts in iron and steel prices have been generally expected. By the end of 1907 consumption had shrunk to extraordinarily small proportions, in consequence of which the United States Steel Corporation was running its plants at only about thirty-five per cent. of their capacity. Since that time, with the appearance

of a light demand from consumers to meet the requirements of weak which could not be postponed, the percentage of capacity in operation has risen to about fifty per cent. But demand continues very light, partly because actual consumption remains small, and partly because consumers confidently expect to supply even their most immediate needs at lower prices. Strenuous co-operation has gone on with regard to the wisdom of the policy pursued, apparently with determination, by the iron and steel trade of maintaining prices, particularly for finished products. Although great pressure has been brought to bear on producers to reduce prices, it appears to have been without much effect. Many interviews with Judge Gary, the Chairman of the Board of Directors of the United States Steel Corporation, have been published in the newspapers, the tenor of which is that prices will not be reduced except as a last resort. There exists more or less of a deadlock between producers and consumers in this very important industry.

While unstrained competitive conditions prevailed among both producers and consumers, doubtless very material declines in all iron and steel prices would already have occurred. While the United States Steel Corporation does not enjoy complete control of the industry, its influence is so large as to be dominating. It can, to an extent and temporarily, ignore the law of supply and demand. Therefore, it will be the degree of monopoly power contained in the dominating position of the Steel Corporation in the trade prove an effective barrier to furnish reductions in prices and should the effort to hold prices prove to be ultimately successful, will it also prove to be wholly wise and expedient from the point of view not only from the iron and steel trade, but of that of the national welfare?

On behalf of the consumer the chief contention put forth is that the maintenance of iron and steel prices, under existing conditions of limited demand, constitutes an arbitrary interference with the natural laws of trade which will result in ultimate failure, and will have very harmful effects in postponing recovery from depression. The mere statement of the conditions incline the impartial observer, of course, to agree with it. But the matter is one of such magnitude and importance that it should not be decided offhand. The effort to hold prices under present conditions is one of the most interesting industrial experiments of modern times, and its success or failure may have momentous consequences. Similar experiments have been tried before, particularly by producers of copper; but they have almost invariably ended in failure. In 1904 the iron and steel trade, under the leadership of the Steel Corporation, met with only a small measure of success. The contention of the consumer, therefore, has the support of precedent, in so far as the probable success of the experiment is concerned, whether or not success would prove to be harmful.

What are the facts about prices? The following table, taken from the *Commercial and Financial Chronicle*, shows the average annual prices of standard articles of iron and steel for the last six years:

AVERAGE YEARLY PRICES FOR THE SIX YEARS						
	1907	1906	1905	1904	1903	1902
Old iron rails at Philadelphia.....	\$23.88	\$21.65	\$22.68	\$16.22	\$21.17	\$23.83
No. 1 foundry pig iron, Philadelphia.....	23.89	20.98	17.89	15.57	19.02	22.19
Gray forge pig iron, Philadelphia.....	21.66	17.19	16.38	13.67	17.13	19.20
Gray forge pig iron, Pittsburgh.....	21.62	19.85	15.62	12.89	17.52	19.49
Bessemer pig iron, Pittsburgh.....	22.81	19.54	16.36	13.76	18.08	20.67
Steel rails at mills, Pennsylvania.....	28	28	28	28	28	28
Steel billets at mills, Pittsburgh.....	29.25	27.43	24.05	22.18	27.91	30.57
Far iron, Philadelphia.....	2.11	1.98	1.92	1.72	2	2.13

Present prices of the same articles are approximately as follows:

Old iron rails.....	\$19
No. 1 foundry pig iron.....	17.50
Gray forge pig iron.....	15
Gray forge pig iron at Pittsburgh.....	13.25
Bessemer forge pig iron at Pittsburgh.....	16.75
Steel rails at mills, Pittsburgh.....	28
Far iron, Philadelphia.....	1.35

In July, 1907, the average price of gray forge pig iron was \$22.68. During the first half of 1907 steel billets at times sold well above \$30 a ton.

From the above tables it will be seen that the heaviest declines have occurred in pig iron, the raw material of steel products, whereas the prices of finished steel products have declined very little. Apparently the decline in pig iron affords the steel companies larger profits on such finished products as they are able to sell.

But many of the companies own their own ore supplies, and make less money net present out of pig iron. Pig iron production in March, 1908, was 1,228,204 tons against an average monthly output in 1907 of 2,148,440 tons. The present monthly production of pig iron is slightly lower than the monthly average for 1904, which year marked a depression in the iron and steel trade following the financial troubles of 1903.

These figures appear to justify the demand for lower prices for finished products. They re-enforce the stand-pat attitude of the consumer, for the reason that the present depression in business is of a much more severe character than was that of 1904, when, as shown by the first table, all of the articles stated, except steel rails, sold at lower prices than any so far made this year. Naturally, also, knowing these facts, the independent producers, with plants and capital idle, have been reticent under the requirements of price agreements. But the tables throw more light on the subject still. They dispose of a popular misapprehension, as to the effect of the depression, that most iron and steel prices have been prevented, by trade agreements, from declining materially. It is apparent that pig-iron prices generally have already suffered severe declines, and, as a matter of fact, the prices of many finished products are moderately lower. The effort to maintain prices seems to be concentrated upon certain lines where it is not evident that reductions would stimulate consumption.

The railroads are far the largest users of iron and steel products. In March, 1907, the *Commercial and Financial Chronicle* stated: "We appear to be drifting rapidly into the condition of things existing the latter part of 1903 and a good part of 1904, which so seriously upset the iron and steel trade at that time. The railroads are no longer able to raise new capital with ease; even the strongest companies, those with gilt-edged credit, cannot borrow except at high cost. Prices on the Stock Exchange are tumbling in an alarming way. Everything, therefore, suggests caution. The railroads have already given orders on a scale that will keep furnaces and plants active for many months to come, but they are now proceeding with great circumspection, and giving further orders very sparingly."

Thus over a year ago it was plain that one of the chief causes of the present depression in the iron and steel trade had begun to operate. Ever since that time the same cause, the scarcity of orders from the railroads, has continued to operate. Later, however, there has come what promises to be a total reversal of conditions surrounding railroad borrowing. The amount of idle capital now piling up in bank reserves reaches impressive figures, railroad operating expenses have been materially curtailed, and there is a prospect of a general advance in freight rates. The strong companies now find that they can raise new capital on fairly low terms.

This reversal of conditions undoubtedly is what the dominant interests in the iron and steel trade have been awaiting and expecting. It certainly contains for them an element of perilousness, in the extent that in the near future the promise of orders from the railroads shall be fulfilled, the policy of maintaining prices, from the point of view of future profits, must be conceded to be shrewd and far-sighted. It is difficult to withhold admiration of the courage, the ability, and the vision displayed by those who have undertaken this modern industrial experiment. Changed conditions point to the possibility of success. For several months past the shares of the United States Steel Corporation on the New York Stock Exchange have shown persistent strength. Should this interesting phenomenon continue, it may well be looked upon as significant by consumers of iron and steel; for the stock market, with all its seeming vagaries, usually, in the long run, tells the truth about industrial experiments as about industrial accomplishments.

In one direction the policy of maintaining prices seems of doubtful wisdom and expediency, and may subject the iron and steel trade to grave dangers. That policy makes it very subservient to attempts by the tariff reformers, who will probably have things much their own way in Congress next winter. Purely as an academic matter, the maintenance of iron and steel prices is not warranted; but later on, should it become evident that reductions in prices will stimulate consumption, the same shrewdness and far-sightedness that now maintain them will probably put reductions into effect.

As a general matter it must be admitted that since the advent of the Steel Corporation, iron and steel prices have been more stable than previous to that event. High cards are being played to win, with the end of the game not yet in sight.

The Presidential Skirmish Line

AN IMPARTIAL CONSIDERATION OF THE PERSONALITIES AND TACTICAL STRENGTH OF THOSE IN THE VANGUARD OF THE COLUMNS ADVANCING UPON THE NATIONAL CONVENTIONS

II.—BRYAN—JOHNSON—WILSON—HEARST

By FREDERICK BOYD STEVENSON

In the first part of this article, published last week, it was said that the two strongest Republican candidates were Taft and Hughes, with the personality of Roosevelt overlapping them both, even with the third-term idea eliminated. Hughes probably has lost strength of late, and the indications are that Taft has gained, but whatever their relative political positions may be to-day, one thing seems certain: that the three or four men who, a few months ago, were trailing along merrily in the wake of a possible Republican nomination for the Presidency are now hopelessly out of the race.

There is just this one chance of the lightning striking them: that the Republican National Convention will get wedged into such a tight deadlock—as, for instance, between the Roosevelt and the anti-Roosevelt forces—that some man—say, a man like Senator Philander Chase Knox of Pennsylvania—might be accepted as a compromise candidate. In view of such a contingency, Knox might be considered a possibility, but by no manner of means should he be accepted as a probability. Yet, with one exception—Roosevelt—Senator Knox has the strongest personality of those whose names have been mentioned in connection with the Republican Presidential nomination. Knox stands on his own legs. At the same time it is claimed by his friends—although the public at large is not aware of it—that he "stands for" the most important of the Rooseveltian policies. On the other hand, it is charged that he is a corporation lawyer and a close friend of "the money power."

Not long ago I spent some time with Senator Knox at his house, and on that occasion he talked freely to me. At no time did he class himself as an entrant in the Presidential race with the idea of creating a boom for himself. From the start he has occupied the position of the proverbial "dark horse," and if he has been playing the game at all, it is the waiting game. There are no outward and visible signs that Senator Knox, at any period of the Presidential movement, has been toying with politics. But he is not asleep. His State Legislature, early in the day, endorsed him for the Presidential nomination, but whether that act was mere courtesy or politics has not yet been made apparent. As for the ability of Senator Knox to fill the Presidential chair, it may be said that from a technical standpoint he is exceedingly well equipped—perhaps, as to strictly official capacity, expert business experience, and law and statesmanship, the best equipped of any of the candidates in the race.

In the earlier part of the year George Bruce Cortelyou was considered as a Presidential candidate; not a strong

candidate, but a possibility. Certain factions looked upon him as a conservative. That tendency really had Presidential aspirations has not been denied, although the little fame he enjoyed in this direction was short-lived, and as a serious possibility—if he ever was one—he deserves but a paragraph mention here.

There was a time—about a year ago—when Charles Warren Fairbanks was accredited with cherishing Presidential aspirations; but to-day he can plead "not guilty" before any petit jury in the land and obtain a clear bill of acquittal.

We have reviewed the situation as it appears to-day in the Republican camp, but there is no guarantee that it will continue so till the day of the nominating convention.

But there is a Democratic side to the situation.

Not so very long ago there didn't seem to be any Democratic possibility—just one large Democratic certainty, to wit: William Jennings Bryan. And to-day there are those who proclaim that Bryan is the one best bet. However, there are at least three other candidates in the field who occupy positions of more or less importance, and although one of them cannot be classed as a Democrat, he may, to a certain extent, have an influence on the Democratic convention. But there is still Bryan as the bright particular star.

With a policy that shifts whenever his needs require that it should shift, Bryan has an all-powerful grip upon the Democratic party—the saving power of a hyphenate. He has a hidden strength that develops suddenly and unexpectedly. And whereas does this great strength lie?

First, there is his apparent sincerity. One who has ever heard him say, "How are you?" will not question the secret of the man's popularity. In a talk with him not long ago, I said:

"They once called you the chief of radicals."

He nodded and laughed.

"And some say," I went on, "that President Roosevelt has stolen your thunder."

He laughed loudly this time.

"Yes," said he, "they have said so."

"And has he?" I insisted.

"Well," he replied seriously,

"there are some things the President does which I wouldn't do. But, understand me," he added quickly, "this is not criticism. The President has done a good many things that Democrats are glad to know he has done—glad to see even a Republican do. But we should be better pleased to see those things done by a Democratic President. Many of these things have been simply the carrying out of Democratic principles. But, on the other hand, the President has done things that I would not do, he has done things that have been undemocratic."

I spoke to him about the war on the corporations.

"There is no need for any

William Jennings Bryan

"ONE WHO HAS EVER HEARD HIM SAY, 'HOW ARE YOU?' WILL NOT QUESTION THE SECRET OF THE MAN'S POPULARITY."

honest corporation to Iran," said he. "There is no need for any man to fear the action of the government if he be an honest man—if he obey the laws of his country."

And how do the people at large compare Roosevelt and Bryan? There are those who believe that Bryan, if elected President, would continue certain of the policies which Roosevelt has begun; and there are those who believe that he would go much farther than Roosevelt has gone. Some believe that if Hughes were nominated for President by the Republicans, many Roosevelt admirers would desert to the Bryan standard.

Except, perhaps, in a few cases of parallel policies, there is really no comparison possible between Roosevelt and Bryan. Bryan has the vigor of Roosevelt, and he is younger by ten years. Both smack of the West, it is true, and Roosevelt has a similar heartiness, which long training in the East and the restraining influence of his position control with difficulty. But this heartiness, in the case of Roosevelt, runs along with jerks, and sometimes stops suddenly as if it were a fractious horse brought up with a curb bit. With Bryan, who has nothing to curb him, this heartiness is spontaneous and continuous. Roosevelt is a mixture of East and West, Bryan is a full-blown Westerner. Bryan has told us all many times that his Democratic ideal is Jefferson. He has told us of his faith in that Democratic party founded by Jefferson. We know what Bryan thinks of Jefferson, and we cannot help but think that Bryan thinks that if Jefferson were still on earth he would think pretty well of Bryan.

The Bryan of to-day is a stronger man than the Bryan of yesterday. The Bryan of yesterday awoke one morning and found his speech on every man's tongue. It was his own eloquent tongue that had made him famous at the Chicago convention when he electrified the audience with his "cross of gold" speech. But before this he had seen his opportunity in his first tariff speech, and that speech made him one of the best-known men in Congress. So his leap into fame really came with this first speech. It was the result, perhaps, of luck, but certainly of an intelligent employment of his opportunities. Since then he has been more or less in the public limelight.

The man who stands next to Bryan in the Democratic race for the Presidency is Governor John A. Johnson of Minnesota. Johnson's boom was decisively launched in Minnesota early in March, when the Democratic State Committee endorsed him for the Presidency. Twenty days after his endorsement he expressed a willing assent to accept the nomination if it were tendered to him, and thus he became a full-fledged candidate.

Johnson's candidacy has a picturesque setting after the manner of the candidacy of Lincoln. At the start there was the lowly tide. Born of poor Swedish parents at St. Peter, a little Minnesota town, forty-six years ago, with a father who was a handloom to him, with his mother taking in washing, he himself forced to do manual labor, life's prospects were not bright for him. His first steady job was in a grocery store. Then he kept time for a railway crew, later he secured a place in a drug store, after that his mother no longer took in washing, and the other children went to school. That tells the story of the man better than a volume of eulogies.

By industry and the help of those who had confidence in him he became the owner of a little local newspaper, and from there was graduated to the State Senate. The campaign of 1904 made him. The Democratic party in Minnesota was demoralized, and as a forlorn hope in the Roosevelt year Johnson was made the nominee of that party for Governor. He ran aside all party lines, and just went out and talked to the people. Roosevelt's plurality in Minnesota was 101,000, but Johnson was elected by 79,000-odd votes. Two years later he was again elected to the governorship by 74,000 plurality. His policy is anti-tariff, anti-trust, favors the regulation of railways, is against colonial possessions, and advocates a definite adjustment of State and Federal powers, with a shade the better of it for the State. He has placed himself on record as saying:

"I consider the tariff the paramount issue of the coming Presidential campaign. You cannot solve the trust evil successfully until the conditions that produce the trusts are improved. You cannot cure blood-poisoning as long as the silver continues in the body. It is about time that infant industries 100 years old were weaned from their need of protection."

"I do not believe in legalized destruction and confiscation of property. There is a right to property. Government is bound to give protection to property just as it protects human life. The right to enjoy property is guaranteed under the Constitution, and it cannot be denied to the citizen. The man who has a dollar invested in farm or factory has a right to have that dollar safely safeguarded from the attacks of the unscrupulous financier on the one hand and the extortionist and the other."

"Capital in corporate form often can do business more economically and successfully than separately. But I do not believe in permitting co-operation of capital to the extent of annihilating the business of individuals. Capital has destroyed individual effort principally through evasion of the law."

"The great curse of the country is the fictitious valuations placed upon property, and the fact that the American people must by their energy and economy pay tribute to this kind of greed by paying a rate of interest and profit on property which has no existence."

The claims of Woodrow Wilson, president of Princeton University, have been industriously urged; and in speaking of him I cannot do better than quote the estimate of his qualifications that has been placed before the country by the editor of this journal: "That he is preeminent as a lucid interpreter of history we all know. But he is more so. No one who reads, understandingly, the record of his country that flowed with such apparent ease

HE REGARDS THE TARIFF AS THE PARAMOUNT ISSUE OF THE CAMPAIGN, AND HAS SAID THAT HE CONSIDERS IT "ABOUT TIME THAT INFANT INDUSTRIES 100 YEARS OLD WERE WEANED FROM THEIR NEED OF PROTECTION."

from his pen ran full to be impressed by the belief that he is by instinct a statesman. The grasp of fundamentals, the sovereign unconscious application of primary truths to changing conditions, the breadth in thought and reason manifested on those pages, are . . . clear evidences of sagacity worthy of the best and wisest of Virginia's tradition. . . . Mr. Wilson is, as stated, more than the accomplished scholar, the practical educator, the competent executive he has proven himself to be; he is, in truth, a statesman of breadth, depth, and exceptional sagacity. He is an idealist, yet notably sane. He is a genuine orator whose words ring true and bear conviction. He stands for everything that is sound and progressive. He holds the respect of every one with whom he has come in contact, and the admiration particularly of all college-bred men. His fidelity to the interests of the whole people is an unquestioned asset to his integrity. He represents an class, an creed, no lobby, no vain imagings. He is at the fulcrum of his powers in age and experience. He has profound convictions from intellect and learning and the courage of fearless expression. He has no enemies—his is a clean state. He possesses to a degree unequalled since the days of Blaine that indefinable quality known as personal magnetism. He is not only high-minded but broad-minded and strong-minded. He was born in Virginia and hailed from New Jersey. His ancestry would be a recognition of the South which the South nobly deserves. His election would be an everlasting pledge of a country united in fact, in determination to solve all besetting problems, in inspiration to fulfil America's highest destiny. Such is the man, and such a man is needed by the country, from whatever political party he may come."

To that there can be, actually, nothing to add, save to express the wish that the first of events may bring Woodrow Wilson into a more active relation with Democratic plans than is at present the case. He himself would be the last to raise a hand in favor of his nomination.

There are three or four other Democrats, perhaps, who might properly be listed in the "also ran" class. Among these is Judge George Gray of Delaware. Gray was Attorney General of that State and United States Senator in 1885-89. He was on the Fair Price Commission in 1898, a member of the Court of Arbitration under the Hague Commission, and also one of the members of the Anthracite Coal Commission. He is a judge of the United States Court, and makes his home at Wilmington. He was prominent as a gold standard Democrat.

Another man mentioned in connection with the Democratic Presidential nomination is Judge Judson Harmon of Ohio. He was Attorney General of the United States from 1895 to 1907.

Woodrow Wilson, President of Princeton University

"HE IS MORE THAN THE ACCOMPLISHED SCHOLAR, THE PRACTICAL EDUCATOR; HE IS A HYPERMAN OF BREADTH, DEPTH, AND EXCEPTIONAL SAVANTRY"

He is at present practicing law at Cincinnati, and is President of the Ohio Bar Association.

Within the last few days another factor has entered into the

Democratic calculations. That factor is William Randolph Hearst, whose political grace, the wisecracker said, was dug by Hughes, and at whose obsequies the House of Yummy Hall and one Patrick H. McCareen of Brooklyn were said to have officiated. But Hearst is not dead, for we saw him the other night promulgating the doctrine of a new national party which he says has no affiliation or sympathy with the old parties.

I first met Mr. Hearst in the Mayoralty campaign of New York which he is still fighting. Later, I became better acquainted with him when he was running on the Democratic ticket against Governor Hughes in 1906. Now, you may have your own opinion of Hearst. You may be for him or you may be against him; no matter what stand you take, you must admit this one thing: Hearst keeps busy. Hearst on a campaign is like one of his own afternoon newspapers—there is a new edition every fifteen minutes, with extras between the editions. The Hearst political policy aims to accentuate the striking, the picturesque features of the campaign, as the Hearst newspaper policy aims to accentuate the striking, the picturesque features of the news. What Mr. Hearst doesn't say on the political stump to the advantage of his candidacy, Mr. Hearst's newspapers—morning, noon, evening, and midnight—say in glaring scare headlines on the journalistic stump. Sometimes spellbinder and newspapers work simultaneously like both barrels of a double-barreled shotgun. This happened at one of the little stations on the route during his peregrinations at the time of the Cleveland campaign.

"There are the populace cheering for you," exclaimed an enthusiastic follower to him.

The colored porter poked his head out of the window.

"But look, look funny people to me," said he, when he had resumed his usual dignified position. "But people are goodboys, and dey is selling de New York Herald's mind."

But it was all one and the same thing for the Hearst campaign song was being sung. The question, then, naturally arises: If Hearst can make such a stir during a State campaign, what could he do if he were running for President? And from the present outlook it seems as if Hearst had his eye on the Presidential chair, and as if to make his nomination doubly sure he had created this new "National Independence party." And what effect this movement will have on the Democratic party remains to be seen. But at any rate there is Hearst, and he is probably going to have something to say in the coming Presidential campaign—and he will say it loudly.

We have traversed the Democratic field as it is to-day. Mr. Bryan holds, at the moment, the centre of the stage. But against those to whom the persuasion of his personality and his talk appeals must be set those others who regard his possible candidacy with genuine apprehension—those whose views concerning him have been thus obscurely summed up. "He is not a great statesman and never will be. He is a fair moralist, a great entertainer, and would probably have made a notable preacher or an extraordinary actor. That he has great gifts is indubitable; that he has great personal attractiveness is evident. So also is it evident to any thoughtful student of his record that he is unfit to be trusted with the great responsibilities of the Presidency."

Physical Cure for Backward Schoolchildren

LEADERS of pedagogy in France say that the average teacher of children does not understand his pupils, because he will not deviously subconsciously to observe that varied and portentous thing, the mind of a child. It is certainly true that the majority of teachers forget that the real purpose of education is adaptation to environment; for if teachers knew what education means they would not give the same form of instruction to fifty pupils of different mental capacity, different temperament, and different physical aptitude.

"Your theory is good," exclaims the school teacher, "but we are not gifted with second sight, and our time is too limited to permit a study of the different natures entrusted to us."

Their answer is reasonable, but the problem is too important to be allowed to rest here. It is for the purpose of solving it that the Society for Psychological Study has established the Laboratory of Normal Pedagogy in the boys' primary school in the Rue de la Grange aux Belles, in Paris.

The laboratory is an airy, well-lighted room overlooking an open field. The spirometer, the automatic weigher, the dynamometer, the gauge for determining the diameter of the human shoulder, the drum and cylinder register, blackboards for sight-testing, instruments for the measurement of auditory acuteness—everything to enable the examiners to study the mental, sensitive power, memory, judgment, and imagination of children, is found there. Dr. Binet, the director of the Laboratory of Psychology of the Sorbonne, manages the institution, and is assisted by an expert pedagogue.

The teacher of the old school is too often ignorant of the fact that there are physical causes for his pupils' shortcomings. They fail to learn, and he punishes them. When bad scholarship is the result of physical deficiency or other abnormal conditions it is unjust, stupid, and brutal to lay the blame to carelessness or ill will or inattention. The deaf ears, the astigmatic eyes that can scarcely see, the dull brain that fails in consequence to grasp the significance of the lesson, pass unnoticed by the average teacher.

Commencing with the principle that it is cruel to punish a child for inattention when all his energy is required to keep him from going to sleep, or when he is under the torment of some physical ill, the Laboratory of Pedagogy instructs the masters to trace mental faults to physical causes, and has forced the teacher to recognize the fact that the child's physical complaints are of many sorts and degrees. Nervousness and sensitiveness, timidity, and all such evils are to be classed as the results of the physical causes which are the real reasons for poor scholarship. The teacher's first duty is to be sure that his pupil is not enduring some bodily torment. When a child has appeared lazy for days together, if the school-teacher is wise he makes an investigation into its physical condition.

If he is anywhere near the Laboratory of Normal Pedagogy, public opinion forces him to avail himself of this institution. He measures and weighs his pupil and tests his physical capacity; he finds out whether the pupil is in advance of or behind the children of his own age. The point reached, the physician comes in. Intellectual weakness is recognized by doctors as a symptom of a very dangerous physical condition. Recent studies have proved that the tactile sensibility diminishes as brain fog increases. The tactile sensibility is measured by Girardet's esthesiometer—two points of a compass which register their contact with the epidermis upon a cylinder. In sight examination, which is an important branch of the laboratory work, the blackboard test is very simple and true. Many children suffer from unrecognized forms of optical trouble. Some are ignorant of their defect. Some are careless, afraid of the doctor, or timid. They do not complain, and so their teacher marks them "lazy," or "inattentive."

These innovations in behalf of the children have not come too soon. They are needed whenever civilization has produced abnormalities in the human organism. The child of today is descended from ancestors strong of tooth and keen of eye. His teeth are poor and his eyes need spectacles. But he is the potential father of the next generation, and he needs all the help that the sciences can give him; and he cannot get it too soon, for he has been abused, slighted, and mismanaged too long.

The Vanderbilt Coach-and-Four in England

Mr. A. G. Vanderbilt on the Box of his Coach "Meteor," leaving "The Green Man," Putney's noted old Inn, on the First Day of his Run from London to Brighton

Walter Godden, Mr. Vanderbilt's Guard, a distinguished Personer on the "Yard of Tin"

Mr. Vanderbilt, in the Coaching Coat, standing beside the "Bobbie," watching a change of Horses at Putney Heath

ALFRED GWYNNE VANDERBILT'S achievement in starting a personally conducted coach service between London and Brighton has elicited a popular ovation. Remarkable scenes of enthusiasm attended his first run. The start was made at eleven in the morning from the doors of the Berkeley Hotel, London, where Mr. Vanderbilt took the reins, his guard being Walter Godden, one of the most expert performers on the "yard of tin" in all England. As the coach passed along Piccadilly all traffic was held up by an enormous, cheering crowd. But the surprise of the journey was the repetition of this enthusiasm at each of the eight stages—in fact all along the Brighton road. At the end of the first run, at Putney Heath, hundreds were assembled, on foot, on horseback, on bicycles, in motorcars and carriages, who welcomed the Meteor and its occupants with rousing cheers, and trailed off behind it when the journey was resumed. Many, in fact, went all the way to Brighton.

This bodyguard was reinforced at every stage. At Reigate a regiment of bicyclists met the Meteor in force and escorted it to the White Hart, one of the old, famous coach houses of ante-railroad days. Paved and followed by almost an army, the coach ran through Crawley, Handcross, and Pyecombe, and into Pyecombe, six miles from Brighton. Here the road was blocked for a quarter of a mile with people and vehicles, and a procession half a mile

The "Meteor" rolling through Malden escorted by a Squad of Bicyclists. Many of these Riders accompanied the Coach during the entire Run from London to Brighton

The Manner in which Crowds Afoot, on Bicycles, in Motorcars, waited at the Relay Stations to see Mr. Vanderbilt

In length led the Meteor through densely lined and police-guarded streets to its destination at the Hotel Metropole.

Mr. Vanderbilt has taken sixty horses in England. Relays of horses will wait at Putney Heath, New Malden, Brixton Heath, Reigate, Crawley, Handcross, Hockstead, and Pyecombe, an extra pair, with a postilion, will be attached at the last of Reigate Hill, and the remaining twenty-six animals will be used for emergencies and to provide extra pairs for hitchhiking. The coach used for the regular journey will be the Venture, which will run from London on Monday, Wednesday, and Friday, and back each following day. The journey will occupy about five and one-half hours each way.

The Catholic Centenary in New York

By CHARLES JOHNSTON

TRIUMPH for the Irish Church: that is the most fitting description of the great celebration which marked the month of May. Not only were the central figures all either Irish born or of Irish descent, but the multitudes who thronged the Cathedral were largely of Irish race, while the Cathedral itself is dedicated to the Apostle of Ireland. And while it is true in general that New York has not the splendid historic background of other centres of Catholic life in the New World. Neither in antiquity nor in dramatic and tragic force can it compete with Mexico, which had its marked ecclesiastical life, its ripe literary culture, its saints, its martyrs, long before Manhattan was even a village of huts. Nor can New York lay claim to the romance, the high adventure, the magnificent zeal of the second great movement of Roman Catholic life in this country; that epoch which invigorated the spirit of France, and poured forth a band of knights and zealous preachers, who made their way by a chain of mighty lakes and rivers from Quebec through the continent to far-off New Orleans. Spain and France thus claim the first two epochs of the Church's life in the New World; Spain with its saints like Las Casas, its missionaries like Junipero Serra; France with its Champlains and La Salles. The third period belongs to England. It is a period of struggle and strife, when the sectarian wars and bigotries of the Old World found their echoes in the New; a period of persecution and proscription, when the penal laws, which darkened the religious life of Ireland and England during the eighteenth century, cast their black shadow across the ocean.

Even in this English period of America's religious history there are passages to which we can look back with pride and admiration. There was Lord Baltimore's proclamation of tolerance for all, when he attempted his first settlement in Newfoundland. There was the more famous act inspired by his son, and passed by the Legislature of Maryland, in 1649, which declared that "the enforcing of conscience in matters of religion" was a supreme danger, and that no person should be "in any ways troubled, molested, or discountenanced for or in respect of his or her religion, nor in the free exercise thereof." This splendid declaration of spiritual liberty preceded by a century and a quarter the broad and all-inclusive tolerance of the American Constitution.

With the close of the War of Independence we come to the fourth period of the Roman Catholic Church in America, and over this period broods a peculiar degree the spirit of the Irish Church. During Colonial times the American Catholics had been directly subject to the jurisdiction of London. After the Revolution, they had, for the first

time, a bishop of their own, the famous John Carroll, a man of Irish race, a kinsman of the Carrolls of Carrington, whose chief was among the signers of the Declaration of Independence, and like him a close friend of George Washington. Bishop Carroll first bowed the See of Baltimore out of the wilderness, and gave form and consistency to the organization of his Church, in the great territories which had so recently won their national life. He had a vast region under his care, imperfectly defined, touching on the south the territories of the Bishop of Havana, who represented the earliest Spanish epoch of the Church's life in America; and, on the north, marching with the province of the Bishop of Quebec, who symbolized the second, the French period of Jacques Cartier, of Champlain and La Salle. Within the immense See of Baltimore was included New York, as also New England and the States of the South and West. It was the erection of New York into an independent See a hundred years ago which was commemorated by the centennial exercises we are lately witnessing.

New York had appeared in the Roman Catholic history of America far earlier. A full century before the formation of the See of Baltimore, a distinguished Irish Catholic had been Governor of New York. This was Colonel Thomas Dongan; and in 1683 he enacted a law which declared that "no person or persons who profess faith in God by Jesus Christ shall at any time be any ways molested, punished, disquieted, or called in question for any difference of opinion, or matter of religious dissentment"; almost the words of the Maryland law thirty-three years before. We cannot too often recall such enactments as these, which pledge the Roman Catholic Church in our land to the fullest tolerance, the completest spiritual liberty.

In 1848 the See of Baltimore had grown so large that it was decided to form four new Sees: New York, Boston, Philadelphia, and the almost unknown Bardonia in Kentucky as the fourth. Baltimore was at the same time erected into an archiepiscopal See, with John Carroll as its first Archbishop.

The first Bishop of New York was Luke Conneran, a scholarly Irish Dominican, who was chosen, perhaps, through the influence of the Archbishop of Dublin. He never reached New York, however, as he died in Italy before he had even set sail for the New World. Dr. Connelly, another Irishman, was consecrated to succeed him, and once more were heard objections and protests, on the ground that he was a foreigner, and beguile a subject of England, with which this country had been so recently at war.

Cardinal Logue, Primate of all Ireland (the central figure at the top), with his Deacons of Honor

The third Bishop of New York was likewise a foreigner, though not this time an Irishman. John Dubois was born in the Faubourg de Louvain XV, and went in seclusion with Camille Desmoulins and Robespierre. Taking refuge in this country from the storms of the Revolution, he was the love and confidence of Archbishop Carroll, and through his influence was consecrated third Bishop of New York. This was at the time when the government of the Roman Catholic Church in this country was passing through a difficult crisis. Its property was held by trustees, and the trustees took advantage of their position to dictate in the bishops and priests concerning all matters of administration. Against this Bishop Dubois protested, telling his trustees that he could not submit to such dictation. "Gentlemen!" he is reported to have said, "you may vote me a salary or not. I need little. I can live in a basement or a garret; but whether I come up from my basement or down from my garret, I shall still be your bishop."

Bishop Dubois's successor, Bishop Hughes, later the first Archbishop of New York, settled this question with vigor and decision. He entered the field on equal terms, spoke and wrote eloquently against divided authority, and finally won enough votes among his parishioners to carry his point triumphantly. The history of this great man, second only to Archbishop Carroll in the history of the Roman Catholic Church in the United States, is too recent to need any lengthy notice. Two episodes, however, call for mention. The first is his vigorous campaign against the Native American party, otherwise the Know-Nothings, who sought in all ways to arouse hatred and hostility against American Catholics, and the second was the very influential part he played at the time of the civil

WITH THE FLEET ON ITS TRIUMPHAL RETURN TO THE UNITED STATES AFTER ITS 14,000-MILE CRUISE

By CAPTAIN H. C. DAVIS, U.S.M.C.

SPECIAL CORRESPONDENT FOR "HARPER'S WEEKLY" ABOARD THE U. S. BATTLESHIP "OHIO"

It is all over. The target records are made and handed in, the torpedoes have been fired, and now we are on our way to take part in our own welcome back to God's country. The good people of the coast are to entertain us by allowing us to parade for them. After they get us all ashore, where we can't get away, they are to tell us what a great thing the navy is, and what a wonderful thing it is that we have all done our duty. This is a form of entertainment which is so thoroughly enjoyed by the sailors that they are to be allowed to do it in all the ports between San Diego and San Francisco. However, it won't last long, and then we shall all be left to our own devices.

Magdalena Bay saw many struggles. There were the fights for the first place in the target practice, there were fights for the heavy, middle, and light weight championships of boxing, there were the fights for the different race-boat cups, and now we are to get into the region of the "flower fights."

Now that our work is really over for a while and we can look back on the days that have passed, we can form our new plans for the next practice in Manila and profit by our experiences. At the same time, in thinking the matter over, we have all asked ourselves wherein we could have done better for our ships, or batteries, as the case may be. When one has been in a turret, either at a drill or during a practice, when one has seen the stripped men sweating at their work, moving like machines, every nerve tense and every faculty alert for a mistake or a break, when we have seen them amid the rattle and bang of the ammunition cars running up and down at full speed, with rammers driving half-ton projectiles into the yawning maws of the great guns, and have seen how well they did their work, we cannot but wonder how we might have improved them. Yet improvement can and will come, as it has come during the last five or six years. When a ship can go on the range, and in less than four minutes throw projectiles from one turret aggregating more than fourteen thousand pounds, through a canvas screen twelve feet wide and twenty feet long, a mile away, while the ship is moving at a speed of five knots an hour, it is difficult to understand how much improvement can take place with the loads at hand. It seems as though the limit had been reached.

The last few days at Magdalena were spent in getting the men ready for the landing of the Fleet Brigade at San Diego. The Mexican government, for some reason, would not allow armed forces ashore, but the men were placed in the boats and taken over to the beach, and all the motions gone through with. The trip from the anchorage to the landing stages in San Diego is about ten

miles, and to be towed there in small boats is not a very attractive outlook.

April 13.—Paint! Paint! Paint! The deck, down below, bridges, staterooms, cabins, kitchens, in fact everything in sight and a lot not in sight, is having a nice new coat of paint. We are revelling in paint, and we will look like a new ship when we get to home waters. Congress ought to make a special appropriation for cleaning clothes whenever we have a paint festival like this or something equally unimportant.

When the Ohio arrived at Magdalena Bay she completed the circuit of the world, and now she has the proud distinction of being the first and only battleship in the world to circumnavigate it. "Nedder" there is also the first officer in the world to go around it on a battleship, he having been on the Ohio ever since she went into commission in October, 1904.

It was off the Union Iron Works at San Francisco, on the 4th of October, 1904, that the Ohio first hoisted her flag as a part of the navy of Uncle Sam. She was launched in the same yard on the 18th of May, 1901. In the presence of President McKinley, and was christened by Miss Helen Descher. It is odd that I should have been in command of the Guard of Honor, the marines from the Winchester, for Mr. McKinley, on that day, and that I am now serving on the ship I saw take her first plunge. As is usual with new ships on the west coast, she went to Magdalena Bay for her shake down, and after a stay on the coast set out for the Philippines. It was while she was there that she became the flagship of Rear-Admiral C. T. Train, Commander-in-Chief of the Asiatic Station, and it was while he was on her that Miss Roosevelt made her trip to the Orient. The Ohio took the party to Cebu when Miss Roosevelt visited Seoul.

April 14.—We are due to anchor at two this afternoon. Tomorrow we land for the great parade. The Fleet Brigade will land and march to the city square, where the Mayor will present the Commander-in-Chief with a golden key, the key to the city. There will be speechmaking, while the sailor, to whom this parading and playing soldier is at ways a joke, will forget and run in his place and wish it were all over so that he could "make a liberty" and go to a theatre or a dance. There will be sixteen companies of marines leading the procession, followed by eighty-four companies of sailors, and they in turn will I presume, be followed by the Native Sons of the Golden West, the Native Daughters of the Golden West, the Irish Section of the Bohemian, and other attractive societies. We are a great people.

If time and opportunity permit themselves while at Catalina Island, some of our other men will probably make a try for a tuna, a fish which is much like the tarpon of the Florida Coast. Admiral Emory killed sixty "yellow tail" in Magdalena Bay, and that, as far as I know, is the record for this trip. He used a light tarpon rod and line, and as some of the fish run up to thirty pounds it must have been good sport. The sight of the United States is rather good, and we are anchored now in columns of divisions, while the face of the water is alive with every imaginable kind of craft. It seems people have come for hundreds of miles to see the fleet.

The Committee of the Hundred is on the way to call on the Commander-in-Chief and give him the freedom of the city, and when they have gone we will probably get a dinner to go to the hotel and have dinner for I don't know how many of us who are mighty tired of sea stories.

Our Chaotic Automobile Laws

By H. P. BURCHELL

If all the evils of which the automobile has been accused since its appearance in this country, nearly a decade, were to be laid before the bar of a jury for impartial adjudication, the list would be nothing less than appalling. How such a collection might be considered would depend upon the viewpoint. The man in the car views the situation from one angle, while the man in the street, of course, sees things from a wholly different one.

The long-suffering motorist has had ample time to realize the truth of this radical definition in many respects. The attitude of the public regarding the possibilities and rights of the motor vehicle has not kept pace with the progress of the machine itself, its great improvements in construction, in simplicity, and in ease of operation.

Court decisions in several States have been widely at variance upon questions of law affecting automobiles. The Massachusetts Supreme Court has just handed down a decision that a highway need not be kept in such condition as to insure complete safety to motor-cars, provided the roads are safe for ordinary travel. In other words, the court decrees that a motor-car is not a carriage within the exact meaning of the law. In *Wilkesbarre, Pennsylvania*, a decision exactly opposite in effect has been rendered. A tripping company owning a toll road prohibited its use to motor-cars on the ground that the road was not built for motor-cars. A suit was brought to compel the company to open its road equally to all desiring to travel over it, and the local judge, in a carriage for the motorists, held that the motor vehicle was a carriage, just as much as a vehicle drawn by horses, and therefore entitled to use any road open to horse-drawn vehicles.

Scores of similar cases might be enumerated, but the few that have been cited will suffice to show that chaos reigns in the automobile legal world. Thirty-six States, including the District of Columbia, have enacted automobile regulations. A cursory review of them reveals at a glance how complex the automobile problem has become, and how difficult it is for the man who desires to make a fairly extensive tour in his own country to do so without a thorough knowledge of the State laws through which he wishes to travel, and without the expenditure of additional sums of money for registration and license. The motorist must also be continually on the alert for local speed regulations, else, in an unguarded moment, he may find himself a culprit before the law.

It is for the purpose of securing uniformity on some of these most vital points that the Federal automobile bill has been introduced into Congress, through the efforts of the American Automobile Association and the National Association of Automobile Manufacturers. The results of the hearing held a short time ago before the Judiciary Committee of the House of Representatives are now being awaited with interest. The sole purpose of this bill, which is noteworthy as being the first effort on the part of motorists to secure some national recognition of their rights, is to provide for the regulation and identification of motor vehicles engaged in interstate travel, so as to give the owner of such vehicle the right of ingress and egress in the various States, without further registration and identification. In a word, the bill seeks to cut the knots that exist in this chain of discord from one end of the country to the other wherever automobile traffic is concerned.

Under the present laws an owner of a motor vehicle living in New York who desires to journey to Washington must not only register his machine in the State of his residence, but he must register and procure a license to operate in three States through which it is necessary to pass: New Jersey, Pennsylvania, and Maryland. This was exactly the experience of the small army of motorists who participated in the Golden Age tour of the American Automobile Association last year, on the run of 1600 miles from Cleveland to New York. Seven States were traversed—Ohio, Indiana, Illinois, Pennsylvania, Maryland, New Jersey, and New York. Three of these States—New Jersey, Pennsylvania, and Maryland—extend no invitation to motorists to enjoy the hospitality within their borders without first paying for the privilege. The other States exact no tribute, provided the owner has complied with the motor law of his home State. In addition, therefore, to the fees paid in his home State, extra registration fees of \$9 had to be paid by the Golden Age tourists, and special numbers procured to use in the three States mentioned, the fee being \$5 in each case. But in New Jersey, if the car was rated over 20 horsepower, it paid \$5 instead of \$3, making the total extra registration bill \$11, with an additional dollar or two for the driver's license.

Charles T. Terry, chairman of the legislative board of the American Automobile Association, who drew up the Federal bill, said in his argument before the Judiciary Committee:

"It would seem that if we are really a nation such a state of things would be impossible as it is intolerable. It must be remembered that there is nothing in the measure under consideration which exempts any vehicle registered under the provisions of this act from the general police regulations of the State laws. The matter of the speed of the vehicle and the safety devices it is required to carry and all other matters are left entirely to State regulations. The only restriction upon the various States is that

they shall not retard and impede motor vehicles engaged in interstate travel and commerce by useless and unnecessary registration and license requirements."

It may be pertinent to inquire what this Federal bill seeks to do toward obtaining reasonable rights on a national basis for the motorist.

First, it makes it obligatory for the owner of a car to comply in every detail with the law of his own State.

Second, it calls for a payment of \$5 for national registration, carrying with it a distinctive number to be displayed at all times on the machine. The numerals are to be not less than three inches long, nor each stroke less than half an inch in width. Preceding the number is to be the initial or abbreviation of the State under the laws of which the motor vehicle has previously been registered, and following the number will be the letters, "U. S."

Third, each motor vehicle must carry at night at least two lighted lamps, one in the rear and one in front, the rear lamp to be so placed that it will clearly illuminate the registration number.

Fourth, it authorizes the creation of a Motor Vehicle Bureau to be part of the Department of Commerce and Labor, in charge of a commissioner with the necessary clerical force.

Whatever the fate of this bill may be in the present session of Congress, its influence has been far-reaching. It has riveted the attention of all thinking persons to a simple question of rights of individuals, irrespective of class, to travel anywhere in their own country without unnecessary exactions or burdens. The constitutionality of the bill is the only upon which it may strike, or, in ante parlance, receive a punture.

The subject is a new one for the Federal lawmakers. The powers of Congress being necessarily limited to its control over commerce between the States as granted by the Constitution and as construed by the commerce decisions of the Supreme Court, the problem to be solved is whether Congress can in any way regulate the use of a pleasure vehicle when operated on the highways of a State other than the State of the owner's residence—its other words, a vehicle engaged in interstate travel.

The national associations of the country, however, are not contenting their endeavors solely upon Congress for some relief from the existing chaos. Efforts are being made through the various State legislatures for enactment of laws that shall possess a reasonable basis of uniformity. Some success has already been achieved, the most conspicuous example being found in Connecticut. Moderates now point to the Nutmeg State as having the best automobile law in the country. Prescribed limitations of speed are ignored, the simple stipulation being that motorists shall at all times drive at a reasonable pace, consistent with the safety of other users of the highway; but as a warning to over-indulgence, a speed exceeding twenty-five miles an hour is deemed unreasonable and unlawful.

The most troublesome State that the motorists have had to deal with is New Jersey. The excellence of its roads, the popularity of its summer and winter resorts, and its location between two of the largest automobile centres in the country—Philadelphia and New York—naturally make the State a desirable and necessary touring ground. The chief cause of complaint is that the lawmakers refuse to allow a motor vehicle to cross the State line unless registered as a New Jersey machine. One day or one year is equal before the law. The same fee must be paid by the transient tourist as by the one who drives over the New Jersey roads 365 days in a year, and this situation is likely to remain unchanged at least for the coming year.

It is doubtful if the majority of automobilists realize the confusion that exists in motor legislation. A brief summary of the real conditions will, perhaps, reveal the urgent need for some reasonable uniformity. The registration fees range all the way from 25 cents in Alabama to \$30 in Texas, some being perpetual, and others payable annually. Connecticut regulates its fee according to horse-power, \$3 for cars under 20 horse-power; \$5 from 20 to 30 horse-power, and \$10 for over 35 horse-power. New Jersey and Vermont have their fee on horse-power ratings, but the present law demands but one annual fee of \$2, and the registration holds good until the machine changes ownership. Twenty-one States exempt visiting tourists from additional charges, the prevailing requirement being that the motorist shall have complied with the law in his home State. Nine States are not exempt—Alabama, Georgia, Maryland, Michigan, New Jersey, Pennsylvania, Texas, Virginia, and West Virginia.

No two States agree in respect to automobile restrictions. Despite the demands of the motorists, it is perhaps too much to expect that the conservative public, attached to traditional and abetted methods in many sections of the country, would at once take readily to the revolutionary movement in the automobile. Like all new things of lasting value, the motor-car is still in its probationary stage, but as its utility and practical benefits are more widely recognized, the man in the car will ultimately receive what he demands as common-sense treatment.

The Passing of the Black Republics

By SYDNEY BROOKS

LONDON CORRESPONDENT FOR "HARPER'S WEEKLY"

RECENT disorders have brought Haiti once more into the attention of Europe. The future of the negro and the mulatto republic that share the island which Columbus christened Hispaniola is not, indeed, a matter of great moment to Europe. A good deal of European capital is invested in San Domingo, and most of the bondholders are Europeans, while in Haiti the Germans have pegged out a relatively large number of commercial claims. But this is not enough to make the future of either of the two republics a political question of real interest or magnitude. Europe's concern in the recent crisis was virtually confined to seeing how the United States would handle it. It is quite well understood over here that San Domingo and Haiti come within the scope of the Monroe doctrine, and that if they ever pass under white control it will be the control of Americans and not of Europeans. The arrangement which placed the reversion of San Domingo in American hands was acquiesced in by all the European governments with scarcely more than a diplomatic protest. The speculators who had preyed upon the island and saw their game drawing to a close naturally grumbled; but they could not move their governments to the point of intervention. Nor would there be any real objection if President Roosevelt or one of his successors were to decide that the time had come when the entire island and the two republics that occupy it should be, if not formally annexed, at any rate brought as definitely under American suzerainty as Cuba itself.

That or something like it is regarded over here as the inevitable outcome. Every year the United States seems to make it more certain. Even the London *Notion*, a journal opposed on principle to everything that smacks of aggressive imperialism, admits that the independence of the two republics is doomed. "The Panama Canal," it says, "is destined to affect all the West-Indian Islands, but none more intimately than the island which is at present occupied by the two republics of Haiti and San Domingo. Hispaniola, to revive the name given it by Columbus, lies between Cuba and Porto Rico directly in the path of ocean communication between Europe, America, and the Indian Ocean. The two channels that lead themselves most readily to cut through and move round round the past its shores. When the canal is completed, Hispaniola will command the entrances to it, and its supreme strategic importance will almost inevitably connect itself with the question of its political future. Already the two-thirds portion of the island occupied by San Domingo is in the hands of American receivers. The remaining third, dominating the Windward Passage, and occupied by the republic of Haiti, is scarcely likely under any circumstances to remain free much longer from a somewhat similar form of control. The modern world is crowding upon it unwelcome; the opening of the isthmian waterway will revolutionize all its internal possibilities and all its external relations; and every disturbance that occurs within its boundaries will furnish another argument for bringing it under white supervision. Before another decade has gone by the fate of Haiti may be that of the Transvaal."

This seems to be a reasonable forecast; and the mention of the Transvaal at once suggests a parallel and points a moral. The Haitians, like the Boers, are placed in possession of riches that they do not care for and are without the means of developing. It is not mean that there is likely to be discovered in Haiti any such prodigious source of wealth as the Transvaal gold fields. But it is certain that Haiti, besides being a very beautiful, is also a very rich country; that the sample of ores exhibited by the government and shown to travellers indicates immense possibilities; that coffee, cocoa, cotton, sugar, and many valuable woods offer tempting commercial rewards; and that the Haitians are utterly incapable of making the most of their resources. Practically they live on inherited capital. The products of the island maintain their value not on account of any cultural efficiency, but simply because of their intrinsic quality and of the natural fertility of the soil. They do not have to be cultivated; they grow wild, and in the absence of scientific tending growing wild is merely another name for a slow but progressive deterioration. In their unwillingness or inability to develop their material resources the Haitians, therefore, are very much like the Boers. They resemble them, again, in their attitude towards foreigners. In normal times a white foreigner can trade through the island not only without danger, but meeting on all sides with kindness and hospitality; and even during the periodic outbreaks of revolution it is rarely that white men, as such, are attacked. But their position is never one of real security, and at any moment, when patriotism happens to be unusually strong, it was, for instance, during the centenary celebrations of Haitian independence, on which occasion posters appeared on the street advocating a massacre of the whites—their position is liable to become one of unclouded peril. Moreover, as in the Transvaal, the whole policy of the state is to keep the foreigners under lock and key. They cannot hold any public

office or take part in political affairs or embark in any business or industry without a government permit; nor can they engage in the exporting trade or hold any landed property. These are not to be sure, very onerous restrictions, and many of these, no doubt, can be circumvented by a judicious bribe. But coupled with the race antagonism that may at any moment break loose they are sufficient, unless human history is about to reverse itself, to enfold the republic in the sort of "foreign combinations" that are the usual prelude to foreign domination.

Moreover, Haiti is the land of revolutions. Of all its presidents only one has died a natural death. Its history is that of anarchy mitigated by military despotisms. The world, perhaps, has formed its opinion of Haiti somewhat too exclusively from the record of her turbulent episodes. It has never quite done justice to the unparalleled difficulties that faced a newly liberated people of pure African descent, suddenly called upon to deal with all the problems of self-government. Nor has it quite done justice to the success, such as it is, that the Haitians have achieved. No one who considers the state of the island as it is to-day with that existing under French rule a hundred years ago can doubt that the Haitians have made a solid advance. To ridenote the dirt and stench of their towns, the stagnation of their agriculture, their obsolete army, their educational system, their telephones, telegraphs, and railways, and to swallow and retail, as innumerable short-term visitors have done, the yarns about woodsmen with which the foreigners in the port towns entertain the stranger—all this seems to me singularly ungenerous and unhelpful. The Haitians, in spite of inescapable handicaps, have raised their status to a level of civilization that is little, if at all, below that of an average Central American state. Nor does it seem to me that any who has studied the relations between blacks and whites in any quarters of the world can question that the Haitians are happier, more self-respecting, and in many ways more prosperous than they would have been had France ruled continued. They have kept their blood pure; they have attracted some of the virtues of white civilization; they have preserved their political independence; and they have developed a strong and resolute pride in their nationality.

Nevertheless, the misfortune of their public life is a fact that cannot be disputed, and in all conjectures as to the future of their political state it must be allowed full account to be taken of what is also a menace to their independence is the continual involvement of the foreign consulates and legations in whatever revolution may be in progress. The sequel to every intervention in both Haiti and San Domingo is that the defeated side takes refuge in the foreign consulates. The consuls refuse to hand the refugees over to the victors, claiming for one thing a right of asylum, and for another being naturally unwilling to doom their man-made goods to certain death. The result usually is that after a certain amount of hot-of negotiation the refugees in the consulates are permitted to leave the republic under a guarantee of safe-conduct. This is clearly a very dangerous and unsatisfactory state of things, or that at least is how it presents itself to my mind. The speaker, however, thinks otherwise. "The consuls," it says, "must be supported in every possible way in securing the safety of their nationals, and there our duty ends. If they can retain in addition their right to give sanctuary to Haitians or Dominicans, so much the better, for we are heartily in favor of humanity being allowed to override all the formal theories on which the consulates are established." But is "humanity" really served by the practice? The nation is decidedly of the opinion that it is not. The present custom, it says, "of sheltering and protecting all who seek the hospitality of the legations is a direct incentive to insurrection. It adds to the attractiveness of conspiracy by assuring the conspirator that there is an inviolable asylum open to him if he fails. In addition, it brings the foreign representatives into the very thick of the domestic plot and intrigue, and encourages them to instigate and foment disorders for ends of their own. To substitute an intervention may cost present itself as the shortest cut to a valuable concession. Such things have been done and will continue to be done so long as consulates and legations remain open for political refuge."

It is not, however, the speaker's opinion that it is wise to say that the Haitians should be allowed to fight it out among themselves soundly brutal, but is, in truth, humane. They will be much less ready to fight when they know they have no hope of refuge to fall back upon in the event of defeat. The United States which learned in Chile the international danger of allowing insurgents perpetrate disorders in its own territory in Haiti to serve any of the conspirators. That is the only sound course to take. If all other Powers had adopted it, the disturbances could not have assumed their present form. If when this trouble is over, the American rule becomes the universal rule, the chance of future anarchy will be greatly diminished. If it is, however, the present possibility of the American example being followed. The dubious activities of the consulates will continue to add on more to the many causes that are gradually forcing the United States, in spite of itself, to become responsible for the government of Haiti.

Where the Fairy Tales Came From

By W. R. PRIOR

A grotesque Paper Cutting by the Fairy-maker

A FUND HAS BEEN RAISED IN DENMARK FOR THE PRESERVATION OF THE HOME OF HANS CHRISTIAN ANDERSEN AT ODENSE AS A PUBLIC MUSEUM IN WHICH TO ASSEMBLE HIS MANY RELICS AND MEMORIALS

The Exterior of Hans Christian Andersen's House at Odense

THE house in the Danish town of Odense in which Hans Christian Andersen was born in 1805 has recently been opened as a museum for the preservation of the Andersen relics and memorials. Within the six tiny rooms in Hans Jansen Street are to be found documents that relate to the author's birth, school-days, and early struggles for success, MSS. of the fairy tales, letters, his diaries, as well as portraits and a bust by Durham. Prominent among these is the great work *Picturesque America*, which was presented by American schoolchildren some forty years ago. There are also a photograph of the Andersen statue in Chi-

lago. Hans Andersen is one of the most humorously pathetic figures in literature. His grandfather was an insane woodcarver, his father an idiotic shoemaker. To the poverty of his surroundings and an abnormal mind which found its activity in the dressing of dolls was added an extraordinary appearance. He concealed his neck, inordinately long, within a collar of immense proportions, and his attenuated limbs under clothes of grotesque width, while not a glove or shoe in Denmark could be found to fit his large hands and feet. Yet he faked himself a distinguished appearance. He ran away to Copenhagen to go on the stage, called upon Miss Schall, the ballet leader, to demonstrate his powers, and, before the eyes of that astonished lady, scraped out of his shoes, thumped his hat for a tambour, and broke into such elephantine gambols that she had him dismissed as a madman. His defects and deficiencies at last procured him patrons who patronized him until he astonished the world with his wonderful stories. They are the reflection of his own whimsical, childlike mind. They are himself. He is the Ugly Duckling, hit by the ducks and kicked by the geese, that turned into a swan; and the fantastic melody of *Tromsøer*, trivially, and terror that courses through the famous tales reflects Andersen's history. Their publication in 1835 brought him a European success, and his death in 1875 was mourned with a public funeral in Copenhagen.

The Study in which Andersen wrote the most noted Fairy Tales in all literature

ago, Andersen's furniture, and a pair of enormous shoe lasts, made especially for the author's enormous feet. A more pathetic relic is the little bag found on the body of Andersen after his death; it contained a letter from the Danish girl whom he had loved after her betrothal to another, but this was destroyed by a friend immediately after Andersen's death.

Perhaps the most curious object of all, however, is a letter from a parent, containing the following passage:

"Think of the many young people whom you have sent to the grave through your stories! You are the worst enemy of the human race that has ever existed under the sun, since the time when the devil, seduced our first ancestors."

The Kaiser's Island Home

THE Villa Achilleon in Corfu, deserted thirteen years before her death by its former owner, the late Empress of Austria, and now in the possession of the German Emperor, is well adapted to the ideal life. If not, it ought to be, considering that although the Kaiser bought it for \$200,000 only, it is said the property had cost the Empress six times as much.

The villa occupies the summit of a rock that overlooks the sea, and is surrounded by a peristyle of a dozen marble columns, at the base of each of which there stands a piece of ancient statuary. Indoors a massive staircase gives access to the private and reception rooms, of which, all told, the palace boasts no less than 128. There are, besides, an up-to-date gymnasium, a bathroom having in its centre a white marble basin let into the floor, and a Byzantine chapel rich in treasures from old seaport cities of the Mediterranean.

Upon the terrace, bordering the number of 25,000 bloom with

roses of all kinds that, owing to the equable climate, flower continuously and perfume the air. Beyond this rose jungle there lies the park with African palms, tropical shrubs, and native trees. Here, too, is a diminutive Greek temple; and again, upon descending by a narrow staircase to the sea, the visitor will find perched on the rock, another and yet smaller temple having a monument to Helios, the favorite past of the late Empress.

Shortly before her death, the Empress, feeling to secure a pleasure-chamber for Achilleon, caused it to be dismantled of her personal treasures, and these conveyed to the castle of Laing. Since he came into possession the Kaiser has effected considerable alterations and additions. The private apartments of the imperial family have been entirely renovated in the Empire style. To the palace gymnasium there has been built for the accommodation of the suite an annex with additional rooms for the domestics. An artesian well sunk in the park supplies good drinking water. Garages and barracks have also sprung into existence with the new regime.

A Spirit in Prison*

A Novel

By Robert Richens

AUTHOR OF "THE CALL OF THE BLOOD," "BARBARY SHIP," ETC.

CHAPTER XVI

"HAVE come, you see," said Artois that evening, as he entered Hermione's room, "to have the first of our quiet, happy evenings, about which you were so doubtful."

"Was I?"

She smiled at him from her seat between the big windows.

Outside the door he had, almost with a sudden passion, dismissed the vague doubts and apprehensions that beset him. He came with a definite brightness, a strong intimacy, holding out his hands, intent really on forcing Fate to weave her web in accordance with his will.

"We women are full of little fears, even the bravest of us. Chase mine away, Emile."

"He sat down."

"What are they?"

She shook her head.

"Fearless—or almost. But perhaps that adds to the uneasiness they inspire. To put these little words would be impossible."

"Away with them!"

"Willingly."

Her eyes seemed to be asking him questions, to be not quite satisfied, but quite sure of something.

"What is it?" he asked.

"I wonder if you have it in you to be angry with me."

"Make your confession."

"I have Peppina here."

"Of course."

"You know—?"

"I have known you as an impulsive fellow—how many years?"

Why should you change?"

He looked at her in silence for a moment. Then he continued.

"Sometimes you remind me—in spots, as it were, of George Sand."

She laughed, not quite without bitterness.

"In spots, indeed?"

"She described herself once in a book as having 'a great facility for illusions, a blind benevolence of judgment, a tenderness of heart that was insupportable.'"

"Oh—?"

"Wait! From these qualities, she said, came hurry, mistakes, innumerable, herode devotion to objects that were worthless, much weakness, tremendous disappointments."

Hermione said nothing, but sat still, looking grave.

"Well, don't you recognize something of yourself in the catalogue, my friend?"

"Have I a great facility for illusions? Am I capable of herode devotion to worthless objects?"

Suddenly Artois remembered all he knew and she did not know.

"At least you act hastily often," he said, evasively. "And I think you are often so concentrated upon the person who stands, perhaps suffering, immediately before you, that you forget who is on the right, who is on the left."

"Emile, I asked your advice yesterday, and you would not give it me."

"A fair hit!" he said. "And so Peppina is here. How did the servants receive her?"

"I think they were rather surprised. Of course they don't know the truth."

"They will within—shall we say twenty-four hours, or less?"

"How can they? Peppina won't tell them."

"You are sure? And when Gaspare goes into Naples to 'fare la sposa'?"

"I told Gaspare last night."

"That was wisdom. You understand your watchdog's character."

"You grant that Gaspare is not an instance of a worthless object made the recipient of my herode devotion?"

"Give him all you like," said Artois with warmth. "You will never repeat of that. Was he angry when you told him?"

"I think he was."

"Why?"

"I heard him saying 'Tanta della Madonna!' as he was leaving me."

Artois could not help smiling.

"And Vere?" he said, looking directly at her.

"I have not told Vere anything about Peppina's past," Hermione said, rather hastily. "I do not intend to. I explained

that Peppina had had a sad life, and had been attacked by a man who had fallen in love with her and for whom she didn't care.

"And Vere was all sympathy and pity?" said Artois, gently.

"She didn't seem much interested, I thought. She scarcely seemed to be listening. I don't believe she has seen Peppina yet. When we arrived she was shut up in her room."

As she spoke she was looking at him, and she saw a slight change come over his face.

"Do you think—?" she began, and paused. "I wonder if she was smiling?" she added, shortly, after a moment.

"Even the children have their secrets," he answered. As he spoke he turned his head and looked out of the window towards Lucia.

"How clear it is to-night! There will be no storm."

"No. We can dine outside. I have told them." Her voice sounded slightly constrained. "I will go and call Vere," she added.

"She is in the house?"

"I think so."

She went out, shutting the door behind her.

So Vere was working. Artois felt sure that her conversation with him had given to her mind, perhaps to her heart, too, an impulse that had caused an outburst of young energy. Ah! the blessed ardors of youth! How beautiful they are, and, even in their occasional absurdity, how sacred! What Hermione had said had made him realize acutely the influence which his celebrity and his ease—the self that had made it—must have upon a girl who was striving as Vere was. He felt a thrill of pleasure, even of triumph, that startled him, so seldom now, jealous and careful as he was of his literary reputation, did he draw any definite ray from it. Would Vere ever do something really good?

He found himself feeling that she might, as the proud godfather longs for his godchild, to gain prizes. He remembered the line at the close of Maeterlinck's "Fables and Legends"—a line that had gone like a silver shaft into his soul when he first heard it—

"Maintenant c'est ton tour de la pauvre petite."—Now it's the child's turn.

"Now it's the child's turn." He said it to himself, forming the words with his lips. At that moment he was freed entirely from the self-honesty of age, and warm with generous and noble sympathy with youth, its aspirations, its strivings, its misguided hopes. He got up from his chair. He had a longing to go to Vere and tell her all he was feeling, a longing to pour into her—as just then he could have poured it—inspiration under a longed-for furnace. He had no need of any one but Vere.

The door opened and Hermione came back.

"Vere is coming, Emile," she said.

"You told her I was here?"

She looked at him swiftly, as if the ringing sound in his voice had startled her.

"Yes. She is glad, I know. Dear little Vere!"

Her voice was dull, and she spoke—or he fancied so—rather mechanically. He remembered all she did not know and was conscious of her false position. In their intercourse she had so often, so generally, been the enthusiastic sympathizer. More than she knew she had inspired him.

"Dear Hermione! How good it is to be with you!" he said, turning towards her the current of his sympathy. "As one grows old one comes to the known, the proved. That passion at least increases while so many others fade away, the passion for all that is faithful in a shifting world, for all that is real, that does not suffer corruption, disintegration! How adorable is *Tuon* where Time is powerless!"

"Is *Tuon* ever powerless?" she said.—"Ah, here is Vere!"

They dined outside upon the terrace facing Vesuvius. Artois sat between mother and child. Vere was very quiet. Her excitement, her almost feverish gaiety of the evening of the storm had vanished. To-night dreams hung in her eyes. And the sea was quiet as she was, reproducing surely of its former furies. There seemed something insubstantial, something pleading in its gaze, as if it asked forgiveness and promised amendment.

The talk was chiefly between Hermione and Artois. It was not very animated. Perhaps the wide peace of the evening influenced their minds. When Vere was turned out Artois lit his pipe, and fell into complete silence, watching the sea. Glisla brought to Hermione a bit of embroidery on which she was working, cleared away the dessert, and quietly disappeared. From the house now and then came a sound of voices, of laughter. It died away, and the calm of the coming night, the calm of the silent trio that faced it, seemed to deepen, as if in delicate protest against the interference. The stillness of nature to-night was very natural. But was the human stillness natural? Presently Artois,

* Reprint from HARRIS'S WEEKLY, No. 2072.

Copyright, 1907, by HARRIS & HARRIS.

suddenly roused, he knew not why, to self-consciousness, found himself wondering. Vere lay back in her wicker chair like one at ease. Hermione was leaning forward over her work with her eyes bent steadily upon it. Far off across the sea the smoke from the summit of Vesuvius was dyed at regular intervals by the red fire that issued from the craters of the mountain. Silently it rose from its hidden world, glowed angrily, menacingly, indeed, they glowed again. And the life that is in fire, and that seems to some the most intense of all the forces of life, stirred Artois from his pose. The pulse of the mountains, whose regular beating was surely indicated by the regularly recurring glow of the rising flame, seemed for a moment to be sounding in his ears, and, with it, all the pulses that were beating through the world. And he thought of the calm of their bodies, of Hermione's, of Vere's, of his own, as he had thought of the calm of the stately sky, the stately sea, that had preceded the hearing of the storm that came from lochia. He thought of it as something unnatural, something almost menacing, a sort of combined life that strove to control, to deny, the leaping fires of the soul.

Students Vere got up and went quietly away. While she had been with them silence had been easy. Directly she was gone Artois felt that it was difficult, in another moment that it was no longer possible.

"Am I to see Peppina to-night?" he asked.

"Do you wish to?"

Hermione's hands moved a little faster about their work when he spoke.

"I feel a certain interest in her, as I should in any new inhabitant of the island. A very confined space seems always to brighten the influence of human personality, I think. In your room everybody must mean a good deal, perhaps more than you realize, Hermione."

"I am beginning to realize that," she answered, quietly. "Perhaps they mean too much. I wonder if it is wise to live as we do."

"In such comparative isolation, you mean?"

"Yes."

She laid her work down in her lap.

"I'm afraid that by nature I am a monopolist," she said. "And as I could never descend into the arena of life to struggle to keep what I have, it often desired to take it from me, I am inclined justly to guard it."

She took up her work again.

"I've been thinking that I am rather like the dog that buries his bone," she added, bending once more over the embroidery.

"Are you thinking of—of your husband?"

"Yes, and of Vere. I isolated myself with Marcell. Now I am isolating myself with Vere. Perhaps it is unwise, weak, this instinct to keep out the world."

"Are you thinking of changing your mode of life, then?" he asked.

In his voice there was a sound of anxiety which she noticed.

"Perhaps. I don't know."

She glanced at him and away, and he thought that there was something strange in her eyes. After a pause she said:

"What would you like to do?"

"Surely you are happy here. And—Vere is happy."

"Vere is happy—yes."

He realized the thoughtfulness of his first sentence.

"But I must think of Vere's development. Lately, in these last days, I have been realizing that Vere is moving, is beginning to move very fast. Perhaps it is time to bring her into contact with more people. Perhaps—"

"You once asked my advice," he interrupted. "I give it now. Leave Vere alone. What she needs she will obtain. Have no fear of that."

"You are sure?"

"Quite sure. Sometimes, often, the children know instinctively more than their elders know by experience."

Hermione's lips trembled.

"Sometimes," she said, in a low voice, "I think Vere knows far more than I do, but—but I often feel that I am very blind, very stupid. You called me an impulsive—I suppose I am one. But if I don't follow my impulses, what am I to follow? One must have a guide."

"Yes, and reason is often such a dull one, like a venter showing one over a cathedral and destroying its mystery and its beauty with every word he speaks. When one is young, one does not feel that one needs a guide at all."

"Sometimes—often—I feel very helpless now," she said.

He was acutely conscious of the passionate longing for sympathy that was alive within her, and more faintly aware of a peculiar depression that accompanied her to-night. Yet, for some reason unknown to him, he could not leave from a certain reserve that checked him, could not speak to her as he had spoken not long ago in the cove. Indeed, as she came in her last words a little towards him, as one with hands tremblingly and a little doubtfully held out, he felt that he drew back.

"I think we all feel helpless often when we have passed our first youth," he answered.

He got up and stretched himself, towering above her.

"Shall we stroll about a little?" he asked. "I feel quite cramped sitting."

"Yes, go. I'll finish this flower."

"I'll take a turn and come back."

As he went she dropped her embroidery and sat staring straight before her at the sea.

Artois heard voices in the house, and listened for a new one, the voice of Peppina. But he could not distinguish it. He went down into the tiny garden. No one was there, and he returned, and

passing through the house came out on its farther side. Here he met Gaspare coming up from the sea.

"Good evening, Gaspare," he said.

"Good evening, signore."

"I hear there's a new owner in the house."

"Signore."

"A new servant."

Gaspare lifted his large eyes towards heaven.

"Tista ditta Missoni?" said Artois.

"Signore."

"Hm, signor, Gaspare."

"Grazie, signore."

"Is she a good sort of girl, do you think?"

"Who, signore?"

"This Peppina."

"She's in the kitchen, signore. I have nothing to do with her."

"I see."

Evidently Gaspare did not mean to talk. Artois decided to change the subject.

"I hear you had that boy Ruffa sleeping in the house the other day," he said.

"No, signore; the signorina wished it."

Gaspare's voice sounded rather more promising.

"He seems popular on the island."

"He had been ill, signore, and it was raining hard. Poveretto! He had had the fever. It was bad for him to be out in the heat."

"So Ruffa's getting hold of you, too?" thought Artois.

He pulled at his cigar once or twice. Then he said:

"Do you think he looks like a Sicilian?"

Gaspare's eyes ran his hands lightly.

"A Sicilian, signore."

"Yes."

"Signore, he is a Sicilian. How should he not look like one?"

Gaspare's voice sounded rebellious.

"Va bene, Gaspare, va bene. Have you seen the signorina?"

"I think she is at the wooden seat, signore. The signorina likes to look at the sea from there."

"I will go to see if I can find her."

"Va bene, signore. And I will go to speak with the signora."

He took off his hat and went into the house. Artois stood for a moment looking after him and pulling at his beard. There was something very forcible in Gaspare's personality. Artois felt it the more because of his knowledge of Gaspare's power of prolonged, perhaps of eternal silence. The Sicilian was both blunt and subtle; therefore not always easily read. To-night he puzzled Artois because he impressed him strongly, yet vaguely. He seemed to be quietly concealing something that was not small. What it was Artois could not divine. Only he felt positive that there was something in Gaspare's eyes that evening he had seen an expression such as he had never seen long ago in Sicily, when Artois rode up after Marcella's death to see Hermione, and Gaspare turned from him and looked over the wall of the ravine; an expression of dogged and impenetrable reserve that was like a door closing upon unseen, just not seen, vistas.

"The devilry!" muttered Artois.

Then he went up to look for Vere.

A little wind met him on the crest of the cliff, the definite caress of the night, which had now fallen ever so softly. The troop of the stars was posted in the immeasurable depths of the firmament.

There was something about the way the stars were set, the darkness, but rather a dimly purple twilight which lifted into its breast the wayward songs of the sea. And the songs and the stars seemed twice children of the wedded wave and night. Divinely soft was the wind, divinely dreamy the hour, and bearing something of youth as a gully from the East bears odors. Over the spirit of Artois a musical resonance seemed scattered. And the youngness that lives before, however deeply buried, in the man who is an artist, stirred, lifted itself up, stood erect to salute the night. As he came towards Vere he forgot. The puppy draught was at his lips. The extreme consciousness, which was both his strength and his curse, sank down for a moment and profoundly slept.

"Vere?" he said. "Vere, do I disturb you?"

The girl turned softly on the bench and looked at him.

"No, I often come here. I like to be here at nightfall. Madre knows that. Did she tell you?"

"No."

"You guessed?"

"I met Gaspare."

"He stood near her."

"When he married?"

"No, the terrace. She preferred to stay quietly there. And so you have been working very hard?"

"He spoke gently, half smilingly, but not at all deservingly."

"Yes, but how did you know?"

"I gathered it from something your mother said. Do you know, Vere, I think soon she will learn to wonder what you do when you are shut up for so long in your room."

The girl's face looked troubled for a moment.

"She doesn't—she has no idea?"

"Oh, no."

Vere was silent for a while.

"I wonder if I ought to tell her, Monsieur Emile," she said at length.

"Tell her?" Artois said, hardly. "But I thought—"

He checked himself, suddenly stirred at the loveliness of his own desire to keep their little secret.

"I know. You mean what I said the other day. But—if madre should be hurt, I don't think I have ever had a secret from her before, a real secret. But—it's like this. If madre knows I shall

feel horribly self-conscious, because of what I told you—her having tripped and given it up. I shall feel guilty. Is it absurd?"

"No."
"And—and I don't believe I shall be able to go. Of course some day, if it turns out that I ever can do anything, I must tell that that would be different. If it's certain that you can do a thing well it seems to me that you have a right to do it. But—tell them—I'm a little coward, really."

She ended with a laugh that was almost deprecating.
"Don't tell your mother yet, Vere," said Artois, decisively.
"It is as you say: if you told her before you have thoroughly tried your wings you might be paralyzed. When, if ever, you can show her something really good she will be the first to encourage you. But—tell them—I think with you that her influence in that direction would probably be discouraging. Indeed, I feel sure of it."

"But if she should really begin to wonder! Perhaps she will ask. It's absurd, but I can't help feeling as if we, you and I, were conspirators, Monsieur Emile."

He laughed happily.
"What a blessed place this is!" he said. "One is made free of the ocean here. What is that far-away light?"

He pointed.
"Lure down! Oh, that must be the light of a fisherman, one of those who seek in the rocks for shell-fish."

"How mysterious it looks, surging in and out! Our feet lie there, the designs of unknown men in the darkness."

"I wonder if—Would you hate to go out a little way in the boat? The men look so strange when one is near them, almost like fire people."

"Hate? Let us go!"
"And we'll get mad to come too."

"Oh yes."
Vere got up and they went into the house. As they came out upon the terrace Hermione took up her embroidery, and Gaspare, who was standing beside her, picked up the tray with the coffee-cups and went off with it towards the kitchen.
"Well, Vere?"

"Madre, we are going out a little way in the boat, and we want you to come with us."

"Where are you going?"
"To see the fishermen, just beyond the Grotto of Virgilio. You will come?"

"Do come, my friend," added Artois.

But Hermione sat still.
"I'm a little tired to-night," she answered. "I think I would rather stay quietly here. You won't be long, will you?"
"Oh no, madre. Only a few minutes. But, really, won't you?" Vere laid her hand on her mother's. "It is so lovely on the sea to-night."

"I know. But honestly, I'm too tired."

Vere looked disappointed. She took away her hand gently.

"Then we'll stay with you, won't we, Monsieur Emile?"

"No, Vere," said her mother, quickly before he could answer, "you won't be very long?"

"No, of course. But—"

"Go, dearest, go. Are you going to row, Emile?"

"I could. Or shall we take Gaspare?"

"It's Gaspare's supper-time," said Vere.

"Flush, then!" said Artois, putting his finger to his lips. "Let me creep down softly, or he will think it his duty to come with us, staring, and that would spoil everything. An revoir, Hermione," he whispered.

"Good-night, madre," whispered Vere.

They glided away, the big man and the light-footed child, going on light with elaborate pretensions.

As Hermione looked after them, she said to herself:

"How young Emile is to-night!"

At that moment she felt as if she were much older than he was. They slipped down to the sea without attracting the attention of Gaspare, got into the little boat, and rowed gently out towards Nisida.

"I feel like a contrabandista," said Artois, as they stole under the lee of the island towards the open sea—"as if Gaspare would see upon us if he heard the sound of our oars."

"Quick! Quick! Let us get away. Pull harder, Monsieur Emile! Row slow you are!"

Artois bent to the oars.

"Vere, you are a baby!" he said.

"And what are you, then, I should like to know?" she answered with dignity.

"I! I am an old fellow playing the fool,"

Suddenly his gaiety had evaporated, and he was conscious of his years. He let the boat drift for a moment.

"Check me another time, Vere, if you see me inclined to be buff," he said.

"Indeed I won't. Why should I? I like you best when you are quite natural."

"Do you?"

"Yes. Look! There are the lights! Oh, how strange they are, like a little nearer, but not too near."

"Tell me, then, remember, I can't see."

"Yes. One, two, three—"

She counted. Each time she said a number he pulled. And she, like a little cowslip, bent towards him with each word, giving him a bodily signal for the stroke. Presently she stretched out her hand.

He stopped at once. For a minute the boat glided on. Then the impetus he had given died away from it, and it floated quietly without perceptible movement upon the bosom of the sea.

"Now, Monsieur Emile, you must come and sit by me."

Treading softly, he obeyed her, and sat down near her, leaving the shadowy coast.

"Now watch!"

They sat in silence, while the boat drifted on the smooth and oily water almost in the shadow of the cliffs. At some distance beyond them the cliffs sank, and the shore curved sharply in the direction of the island with its fort. There, was the enigmatic darkness, though not dense darkness, of the night. Now at hand the walls of rock made the night seem more mysterious, more profound, and at their base flickered the flames which had attracted Artois's attention. Fittingly from these flames, rising from some invisible hearth, or from some torch fed by it, fell upon half-naked forms of creatures mysteriously busy about some hidden task. Men they were, yet hardly men they seemed, but rather unknown denizens of rock, or wave, or underworld; now red bodied against the gleam, now ethereally black as are shadows, and shrimpy and shifty, yet always full of meaning that could not be divined. They leapt, they crouched. They seemed to die down like a wave that is then is not. Then rising, they towered, lifting brawny arms towards the stars. Silence seemed to flow from them, to exude from their labors. And in the swiftness of their movements there was something that was sad. Or was it, perhaps, only pathetic, wistful with the wistfulness of the sea and the wistfulness of liberty under the smiling stars. The lights moved and away. Now the rounded rock, with its red veins and slimy crevices, was gilded, its nudity clothed with fire. Now on the water a trail of glory fell, and travelled and died. Now the red men were utterly revealed, one watching with an ardor that was surely not of this world, some secret in the darkness, another turning as if to strike in defence of his companion. Then both fell back and were taken by the night. And out of the night came a strong voice across the water.

"Madre di Dio, she splendee!"

Artois got up, turned the boat, and began to row gently away, keeping near the base of the cliffs. He meant to take Vere back at once to the island, leaving the impression made upon her by the men of fire vivid, and undisturbed by speech. But when they came to the huge mouth of the Grotto of Virgilio, he said:

"Go in for a moment, please, Monsieur Emile."

He obeyed, thinking that the mother's lure for this dark place was echoed by the child. Since his conversation with Hermione on

As Vere saw it, showing redly through the darkness, she recoiled

of all neutral things? Artois did not ask, but his attention, the attention of mind and soul, was held by those distant, voiceless beings as by a magic. And Vere was still as he was, tense as he was. All the poetry that lay beneath his realism, all the credulity that kept below his scepticism, all the ignorance that his knowledge strove to dominate, and its wild moment of liberty under the smiling stars. The lights moved and away. Now the rounded rock, with its red veins and slimy crevices, was gilded, its nudity clothed with fire. Now on the water a trail of glory fell, and travelled and died. Now the red men were utterly revealed, one watching with an ardor that was surely not of this world, some secret in the darkness, another turning as if to strike in defence of his companion. Then both fell back and were taken by the night. And out of the night came a strong voice across the water.

"Madre di Dio, she splendee!"

Artois got up, turned the boat, and began to row gently away, keeping near the base of the cliffs. He meant to take Vere back at once to the island, leaving the impression made upon her by the men of fire vivid, and undisturbed by speech. But when they came to the huge mouth of the Grotto of Virgilio, he said:

"Go in for a moment, please, Monsieur Emile."

He obeyed, thinking that the mother's lure for this dark place was echoed by the child. Since his conversation with Hermione on

the day of scirence he had not been here, and as the boat glided under the hollow blackness of the vault, and there lay still, he remembered their conversation, the unloading of her passion, the strength and tenacity of the old man in "Pellée" and Mollande's bawled him. Once more he heard them in his heart:

"Now it's the child's turn."
Vere dropped her right hand over the gunwale till it touched the sea, making a tiny splash.
"Monsieur Emile?" she said.
"Yes, Vere."
"Do you believe in the evil eye?"

Artois did not know what he had expected Vere to say, but her question seemed to strike his mind like a soft blow, it was so unforeseen.
"No," he answered.
She was silent. It was too dark for him to see her face at all clearly. He had only a vague general impression of her, of her eagerness, vitality, youth, and half-dreamy excitement.

"Why do you ask me this evening that she was sure the new servant had the evil eye?"
"Peppina?"
"Yes, that is the name."
"Have you seen her?"
"No, not yet. It's odd, but I feel as if I would rather not."
"Have you any reason for such a feeling?"

"I don't think so. Poor thing! I know she has a dreadful scar. But I don't believe it's that. It's just a feeling I have."
"I dare say it will have gone by the time we get back to the island."
"Perhaps. It's alive and dark here."
"Do you like darkness, Vere?"
"Sometimes. I do not."
"Why?"
"Because I can talk better and be less afraid of you."
"Verre what nonsense! You are incapable of fear."
She laughed, but the laugh sounded serious, he thought.

"Real fear—perhaps. But you don't know"—she paused—"you don't know how I respect you."
There was a slight pressure on the last words.
"For all you've done, what you are. I never felt it as I have just lately, since—since—you know."

Artois was conscious of a movement of his blood.
"I should be a liar if I said I am not startled. Tell me about the work. Vere—now we are in the dark."
And then he heard the revelation of the child, there under the weary rock, as he had heard the revelation of the mother. How different it was! Yet in it, too, there was the beating of the pulse of life. But there was no regret, no looking back into the past, no sombre exhibition of force seeking—as a thing groping desperately in a gulf—for an object on which to exercise itself. Instead there was aspiration, there was expectation, there was the wonder of bright eyes lifted to the sun. And there was a reverence that for a moment recalled to Artois the reverence of the dead man from whose loins this child had sprung. But Vere's was the reverence of understanding, not of a dim announcement—more beautiful than Maurice's. When he had been with Hermine under the brooding rock Artois had been impregnated with the passionate despair of humanity, and had seen for a moment the world with outstretched hands, seeking, surely, for the nonexistent, striving to hold fast the mirage. Now he was impregnated with humanity's passionate hope. He saw life lighted in a sweet chase for things ideal. And all the blackness of the rock and of the silent sea was irradiated with the light that streamed from a glowing soul.

"Sento n' addere 'e rose e de visio
Addu assestia stais. Na manao
Se asperde sola sola . . . e a casle tul
Al-tu nu mae
Quasie stu eor
Spantia e mon-
Lantano a le.—
Nocchie lucente
Vase addutano
Devidu do na rosa
Beig tu a."

A voice—an inquiring, searching voice, surely, rose quivering from some distance on the sea, startling Vere and Artois. It was untrained but unsly, and the singer forced it with a resolute boldness that was indifferent to the future. Artois had never heard the Marchesino sing before, but he knew at once that it was he. Some one at the island must surely have told the determined youth that Vere was voyaging, and he was now in quest of her, sending her an anonymous summons couched in the dialect of Naples.

Vere moved impatiently.
"Really?" she began.
But she did not continue. The quivering voice began another verse. Artois had said nothing, but, as he sat listening to this fervid protestation, a message illuminated as it were by the vibrant, he began to hate the terrible frankness of the Italian melody which, till now, he had thought he loved. The beauty of reticence

appended to him in a new way. There was savagery in a hellowed passion. The voice was travelling. They heard it moving onward towards Nisida. Artois wondered if Vere knew who was the singer. She did not leave him long in doubt.
"Now's our chance, Monsieur Emile!" she said, suddenly leaping towards him. "Row to the island for your life, or the Marchesino will catch us!"

Without a word he bent to the oars.

"Ocelia de na rosa.

Bella tu si . . . bella tu si . . ."

Towards the men of fire it went. It died away upon the sea.
"How absurd the Marchesino is!"
Vere spoke aloud, released from heat.
